

## Programmable Spread Spectrum Clock Generator (SSCG)

### Key Features

- Low power dissipation
  - 7.9mA-typ at 66MHz and VDD=3.3V
  - 7.0mA-typ at 66MHz and VDD=2.5V
- Wide 2.5V to 3.3V +/-10% power supply range
- Programmable 4 outputs from 3 to 200MHz
- Low Jitter
  - TBDps at 66MHz
- Programmable Center or Down Spread Modulation from 0.25 to 5.0%
- 8 to 48 MHz external crystal range
- 3 to 166 MHz external clock range
- Integrated internal voltage regulator
- Programmable PD#/OE/SSON#/FS functions
- Programmable CL at XIN and XOUT pins
- Programmable output rise and fall times
- Programmable modulation frequency from 25 to 120 kHz

### Applications

- Printers, MFPs
- Digital Copiers
- NBPCs and LCD Monitors
- Routers, Servers and Switchers
- HDTV and DVD-R/W

### Description

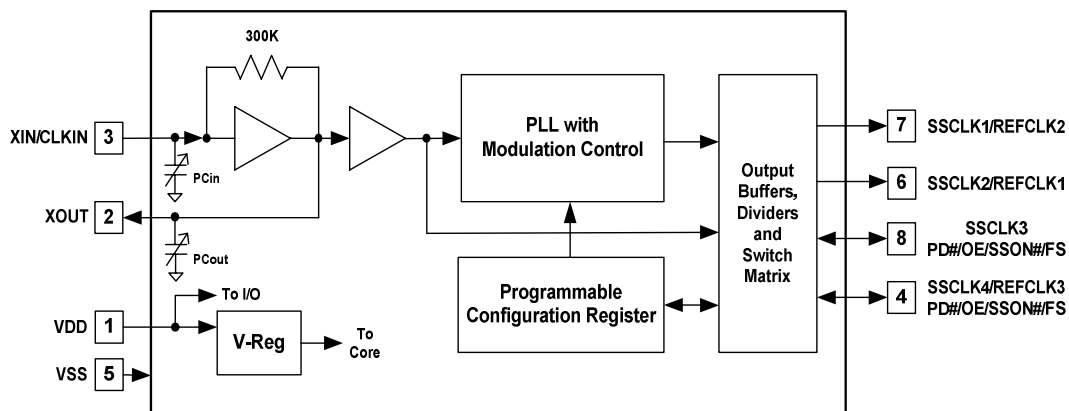

The SL15300 a programmable low power Spread Spectrum Clock Generator (SSCG) used for reducing Electromagnetic Interference (EMI). The product is designed using Spectralinear proprietary programmable **EProClock™** phase-locked loop (PLL) and Spread Spectrum Clock (SSC) technology to synthesize and modulate the input clock. The modulated clock can significantly reduce the measured EMI levels, and leading to the compliance with regulatory agency requirements.

Up to 4 output clock frequencies, Spread %, output rise and fall times, crystal load, modulation frequency and PD#/OE/SSON#/FS functions can be programmed to meet the needs of wide range of applications. The SL15300 operates from 2.5V to 3.3V power supply voltage range. The product is offered in 8-pin TSSOP package with commercial and industrial grades.

### Benefits

- Peak EMI reduction of 8 to 16 dB
- Fast time-to-market
- Cost Reduction
- Reduction of PCB layers
- Eliminates the need for higher order crystals (Xtals) and crystal oscillators (XOs)

### Block Diagram

## Pin Configuration

### 8-Pin TSSOP

## Pin Description

Pin Number	Pin Name	Pin Type	Pin Description
1	VDD	Power	Positive power supply.
2	XOUT	Output	Crystal or ceramic resonator output pin. Leave this pin unconnected (floating) if external clock is used at Pin-3.
3	XIN/CLKIN	Input	Crystal, ceramic resonator or external clock input pin.
4	SSCLK4, REFCLK3, PD#, OE, SSON# or FS	Output or Input	Multi function Programmable SSCLK4 or REFOUT3 clock pin or PD#, OE, SSON#, or FS control pin. Power Down (PD#-Active Low): If PD#=0(Low) and Output Enable (OE-Active High). If PD# or OE is programmed, the pin is weakly pulled high to VDD. If SSON# or FS is programmed, the pin is weakly pulled low to VSS.
5	VSS	Power	Power supply ground.
6	SSCLK2, REFCLK1	Output	This pin can be programmed as SSCLK2 or REFCLK1 clock pin.
7	SSCLK1 or REFCLK2	Output	This pin can be programmed as SSCLK2 or REFCLK2.
8	SSCLK4, REFCLK3, PD#, OE, SSON# or FS	Input or Output	Multi function Programmable SSCLK4 or REFOUT3 clock pin or PD#, OE, SSON# or FS control pin. Power Down (PD#-Active Low): If PD#=0(Low) and Output Enable (OE-Active High). If PD# or OE is programmed, the pin is weakly pulled high to VDD. If SSON# or FS is programmed, the pin is weakly pulled low to VSS.

#### Notes:

1. Pull-down/up resistors can be programmed to VDD or VSS as required. The above programming values are default values.
2. Refer to DC electrical specifications tables for pull-down/up resistor values.

### General Description

The primary source of EMI from digital circuits is the system clock and all the other synchronous clocks and control signals derived from the system clock. The well know techniques of filtering (suppression) and shielding (containment), while effective, can cost money, board space and longer development time.

A more effective and efficient technique to reduce EMI is Spread Spectrum Clock Generator (SSCG) technique. Instead of using constant clock frequency, the SSCG technique modulates (spreads) the system clock with a much smaller frequency, to reduce EMI emissions at its source: The System Clock.

The SL15300 is designed using SpectraLinear proprietary programmable **EProClock™** phase-locked loop (PLL) and Spread Spectrum Technologies (SST) to synthesize and modulate (spread) the system clock such that the energy is spread out over a wider bandwidth. This reduces the peak value of the radiated emissions at the fundamental and the harmonics. This reduction in radiated energy can significantly reduce the cost of complying with regulatory agency requirements and improve time-to-market without degrading system performance.

The SL15300 operates from 3.3V to 2.5V power supply range. Refer to SL15L101 for 1.8V power supply operation.

The SL15300 is available in 8-pin TSSOP package with Commercial Temperature range of 0 to 70°C and Industrial Temperature range of -40 to 85°C.

#### Input Frequency Range

The input frequency range is from 8.0 to 48.0 MHz for crystals and ceramic resonators. If an external clock is used, the input frequency range is from 8 to 166 MHz.

#### Output Frequency Range and Outputs

Up to four (4) outputs can be programmed as SSCLK or REFCLK. SSCLK output can be synthesized to any value from 3 to 200 MHz with spread based on valid input frequency. The spread at SSCLK pins can be stopped by SSON# input control pin, If SSON# pin is HIGH (VDD), the frequency at this pin is the synthesized to the nominal value of the input frequency and there is no spread.

REFOUT is the buffered output of the oscillator and is the same frequency as the input frequency without spread. However, REFOUT value can also be divided by using the output dividers from 2 to 32. The SSCLK is the programmed and synthesized value of the input clock. The remaining SSCLKs could be the same value providing fanout of up to 4 or the frequency can be divided from also 2 to 32. In this case, the spread % value is the same as the original programmed spread % value. By using only first order crystals, SL15300 can synthesize output frequency up to 200 MHz, eliminating the need for higher order Crystals (Xtals) and Crystal Oscillators (XOs). This reduces the cost while improving the system clock accuracy, performance and reliability.

### Programmable CL (Crystal Load)

The SL15300 provides programmable on-chip capacitors at XIN/CLKIN (Pin-3) and XOUT (Pin-2). The resolution of this programmable capacitor is 6-bits with LSB value of 0.5pF. When all bits are off the pin capacitance is  $CXIN=CXOUT=7pF$  (minimum value). When all bits are on the pin capacitance is  $CXIN=CXOUT=38pF$  (maximum value). The values of  $CXIN$  and  $CXOUT$  based on the CL (Crystal Load Capacitor) can be calculated as:  $CXIN=CXOUT=2CL-C_{PCB}$ . Refer to the Page-13 for additional information on crystal load (CL).

In addition, if an external clock is used, the capacitance at Pin-3 (CLKIN) can programmed to control the edge rate of this input clock, providing additional EMI control.

### Programmable Modulation Frequency

The Spread Spectrum Clock (SSC) modulation default value is 31.5 kHz. The higher values of up to 120 kHz can also be programmed. Less than 25 kHz modulation frequency is not recommended to stay out of the range audio frequency bandwidth since this frequency could be detected as a noise by the audio receivers within the vicinity.

### Programmable Spread Percent (%)

The spread percent (%) value is programmable from +/- 0.25% to +/-2.5% (center spread) or -0.5% to -5.0% (down spread) for all SSCLK frequencies. It is possible to program smaller or larger non-standard values of spread percent. Contact SLI if these non-standard spread percent values are required in the application.

### SSON# or Function Select (FS)

The SL15300 Pin-8 can also be programmed as either SSON# to enable or disable the programmed spread percent value or as Function Select (FS). If SSON# is used, when this pin is pulled high (VDD), the spread is stopped and the frequency is the nominal value without spread. If low (GND), the frequency is the nominal value with the spread.

If FS function is used, the output pins can be programmed for different set of frequencies or spread % as selected by FS. SSCLK value can be any frequency from 3 to 200MHz, but the spread % is the same percent value. REFOUT is the same frequency as the input reference clock or divide by from 2 to 32 without spread. The set of frequencies in Table 1 is given as an example, using 48MHz crystal.

The SL15300 also allows a fan-out of up to 4, meaning that Pins 4, 6, 7 and 8 can be programmed to the same frequencies with or without spread.

FS (Pin-8)	SSCLK1/2 (Pins-6/7)	REFCLK4 (Pin-4)
0	66MHz, +/-2%	48MHz
1	33MHz, +/-2%	24MHz

**Table 1. Frequency Selection (FS)**

### Power Down (PD#) or Output Enable (OE)

The SL15300 Pin-4 can be programmed as either PD# or OE. PD# powers down the entire chip whereas OE only disables the output buffers to Hi-Z.

## Absolute Maximum Ratings

Description	Condition	Min	Max	Unit
Supply voltage, VDD		-0.5	4.6	V
All Inputs and Outputs		-0.5	VDD+0.5	V
Ambient Operating Temperature	In operation, C-Grade	0	70	°C
Ambient Operating Temperature	In operation, I-Grade	-40	85	°C
Storage Temperature	No power is applied	-65	150	°C
Junction Temperature	In operation, power is applied	-	125	°C
Soldering Temperature		-	260	°C

## External Components & Design Considerations

### Typical Application Schematic

### Comments and Recommendations

**Decoupling Capacitor:** A decoupling capacitor of 0.1µF must be used between VDD and VSS on the pins 1 and 5. Place the capacitor on the component side of the PCB as close to the VDD pin as possible. The PCB trace to the VDD pin and to the GND via should be kept as short as possible. Do not use vias between the decoupling capacitor and the VDD pin.

**Series Termination Resistor:** A series termination resistor is recommended if the distance between the outputs (SSCLK or REFCLK pins) and the load is over 1 ½ inch. The nominal impedance of the SSCLK output is about 30 Ω. Use 20 Ω resistor in series with the output to terminate 50Ω trace impedance and place 20 Ω resistor as close to the SSCLK output as possible.

**Crystal and Crystal Load:** Use only parallel resonant fundamental crystals. DO NOT USE higher overtone crystals. To meet the crystal initial accuracy specification (in ppm); the internal on-chip programmable capacitors PCin and PCout must be programmed to match the crystal load requirement. These values are given by the formula below:

$$PCin(pF) = PCout(pF) = [(CL(pF) - Cp(pF)/2)] \times 2$$

Where CL is crystal load capacitor as given by the crystal datasheet and Cp(pF) is the compensation factor for the total parasitic capacitance at XIN or XOUT pin including PCB related parasitic capacitance.

As an example; if a crystal with CL=18pF is used and Cp=4pF, by using the above formula, PCin=PCout=[(18-(4/2)] x 2 = 32pF. Programming PCin and PCout to 32pF assures that this crystal sees an equivalent load of 18pF and no other external crystal load capacitor is needed. Deviating from the crystal load specification could cause an increase in frequency accuracy in ppm. Refer to the Table 5 for the recommended crystal specifications.

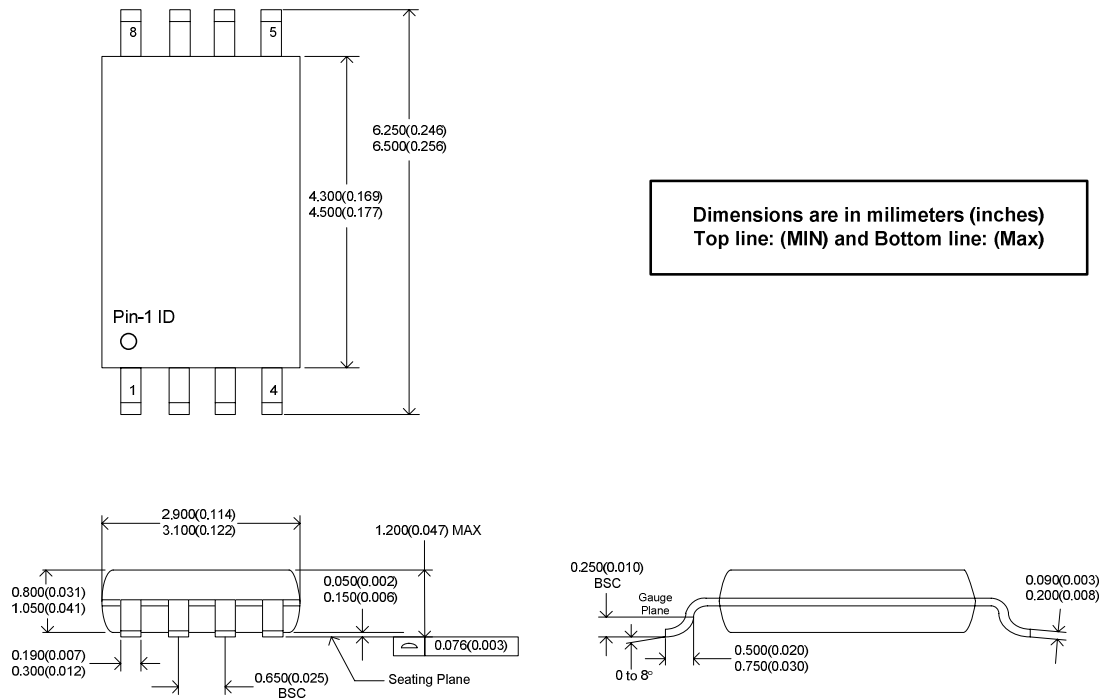

**Recommended External Crystal Specifications**

Parameter	Description	Min	Typ	Max	Unit	Comments
FNOM	Nominal Crystal Frequency Range	8	-	48	MHz	Fundamental Mode – AT Cut
CL	Nominal Crystal Load	6	12	18	pF	Load for +/-0 ppm Fo resonance value
R1,1	Equivalent Series Resistance	20	40	100	Ohm	F-Range: 8.0 to 12.999 MHz
R1,2	Equivalent Series Resistance	12.5	25	60	Ohm	F-Range: 13.0 to 19.999 MHz
R1,3	Equivalent Series Resistance	10	20	50	Ohm	F-Range: 20.0 to 48.000 MHz
DL1,1	Crystal Drive Level	-	-	200	μW	F-Range: 8.0 to 19.999 MHz
DL1,2	Crystal Drive Level	-	-	150	μW	F-Range: 20.0 to 48.000 MHz
Co1	Shunt Capacitance	-	4	5.4	pF	SMD Xtals
Co2	Shunt Capacitance	-	5	7.2	pF	Through Hole (Leaded) Xtals

**Table 5. Recommended Crystal Specifications**

## Package Outline and Package Dimensions

### 8-Pin TSSOP Package (173 Mil)

## Thermal Characteristics

Parameter	Symbol	Condition	Min	Typ	Max	Unit
Thermal Resistance Junction to Ambient	$\theta_{JA}$	Still air	-	110	-	°C/W
	$\theta_{JA}$	1m/s air flow	-	100	-	°C/W
	$\theta_{JA}$	3m/s air flow	-	80	-	°C/W
Thermal Resistance Junction to Case	$\theta_{JC}$	Independent of air flow	-	35	-	°C/W

**Ordering Information** <sup>[1]</sup>

Ordering Number <sup>[2]</sup>	Marking	Shipping Package	Package	Temperature
SL15300ZC-XXX	SL15300ZC-XXX	Tube	8-pin TSSOP	0 to 70°C
SL15300ZC-XXXT	SL15300ZC-XXX	Tape and Reel	8-pin TSSOP	0 to 70°C
SL15300ZI-XXX	SL15300ZI-XXX	Tube	8-pin TSSOP	-40 to 85°C
SL15300ZI-XXXT	SL15300ZI-XXX	Tape and Reel	8-pin TSSOP	-40 to 85°C

## Notes:

1. All SLI products are RoHS compliant.
2. "XXX" is "Dash" number and will be assigned by SLI for final programmed samples or production units based on the each customer programming requirements.

While SLI has reviewed all information herein for accuracy and reliability, Spectra Linear Inc. assumes no responsibility for the use of any circuitry or for the infringement of any patents or other rights of third parties which would result from each use. This product is intended for use in normal commercial applications and is not warranted not is it intended for use in life support, critical medical instruments, or any other application requiring extended temperature range, high reliability, or any other extraordinary environmental requirements unless pursuant to additional processing by Spectra Linear Inc., and an expressed written agreement by Spectra Linear Inc. Spectra Linear Inc. reserves the right to change any circuitry or specification without notice.
