●Description

BR25H□□□-W series is a serial EEPROM of SPI BUS interface method.

●Features

- High speed clock action up to 5MHz (Max.)
- Wait function by HOLDB terminal.
- Part or whole of memory arrays settable as read only memory area by program.
- 2.5~5.5V single power source action most suitable for battery use.
- Page write mode useful for initial value write at factory shipment.
- Highly reliable connection by Au pad and Au wire.
- For SPI bus interface (CPOL, CPHA)=(0, 0), (1, 1)
- Auto erase and auto end function at data rewrite.
- Low current consumption
 - At write action (5V) : 1.5mA (Typ.)
 - At read action (5V) : 1.0mA (Typ.)
 - At standby action (5V) : 0.1μA (Typ.)
- Address auto increment function at read action
- Write mistake prevention function
 - Write prohibition at power on.
 - Write prohibition by command code (WRDI).
 - Write prohibition by WPB pin.
 - Write prohibition block setting by status registers (BP1, BP0)
 - Write mistake prevention function at low voltage.
- SOP8, SOP-J8 Package
- Data at shipment Memory array: FFh, status register WPEN, BP1, BP0 : 0
- Data kept for 40 years.
- Data rewrite up to 1,000,000times.

● Features

○ Status registers

This IC has status registers. The status registers are of 8 bits and express the following parameters.

BP0 and BP1 can be set by write status register command. These 2 bits are memorized into the EEPROM, therefore are valid even when power source is turned off.

Rewrite characteristics and data hold time are same as characteristics of the EEPROM.

WEN can be set by write enable command and write disable command. WEN becomes write disable status when power source is turned off. \bar{R}/B is for write confirmation, therefore cannot be set externally.

The value of status register can be read by read status command.

● Status registers

Product number	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
BR25H010-W	1	1	1	1	BP1	BP0	WEN	\bar{R}/B

BR25H040-W								
BR25H080-W	WPEN	0	0	0	BP1	BP0	WEN	\bar{R}/B
BR25H160-W								
BR25H320-W								

bit	Memory location	Function	Contents
WPEN	EEPROM	WPB pin enable / disable designation bit WPEN=0=invalid WPEN=1=valid	This enables / disables the functions of WPB pin.
BP1 BP0	EEPROM	EEPROM write disable block designation bit	This designates the write disable area of EEPROM. Write designation areas of product numbers are shown below.
WEN	Register	Write and write status register write enable / disable status confirmation bit WEN=0=prohibited WEN=1=permitted	
\bar{R}/B	Register	Write cycle status (READY / BUSY) status confirmation bit \bar{R}/B =0=READY \bar{R}/B =1=BUSY	

● Write disable block setting

BP1	BP0	Write disable block					
		BR25H010-W	BR25H020-W	BR25H040-W	BR25H080-W	BR25H160-W	BR25H320-W
0	0	None	None	None	None	None	None
0	1	60h-7Fh	C0h-FFh	180h-1FFh	300h-3FFh	600h-7FFh	C00h-FFFh
1	0	40h-7Fh	80h-FFh	100h-1FFh	200h-3FFh	400h-7FFh	800h-FFFh
1	1	00h-7Fh	00h-FFh	000h-1FFh	000h-3FFh	000h-7FFh	000h-FFFh

○ WPB pin

By setting WPB=LOW, write command is prohibited. As for BR25H080, 160, 320-W, only when WPEN bit is set "1", the WPB pin functions become valid. And the write command to be disabled at this moment is WRSR. As for BR25H010, 020,040-W, both WRITE and WRSR commands are prohibited.

However, when write cycle is in execution, no interruption can be made.

Product number	WRSR	WRITE
BR25H010-W	Prohibition possible	Prohibition possible
BR25H020-W		
BR25H040-W		
BR25H080-W	Prohibition possible but WPEN bit "1"	Prohibition impossible
BR25H160-W		
BR25H320-W		

○ HOLDB pin

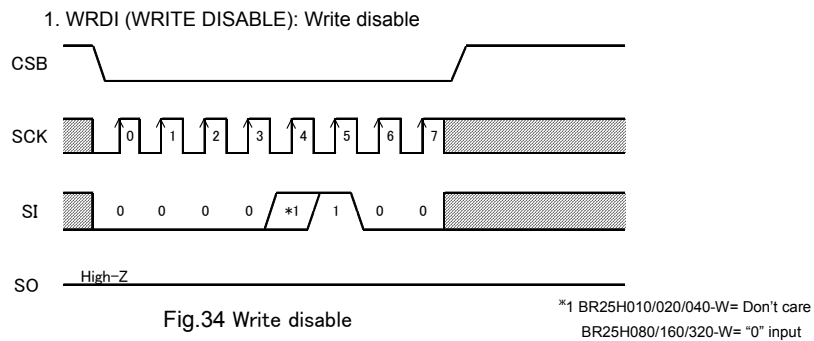

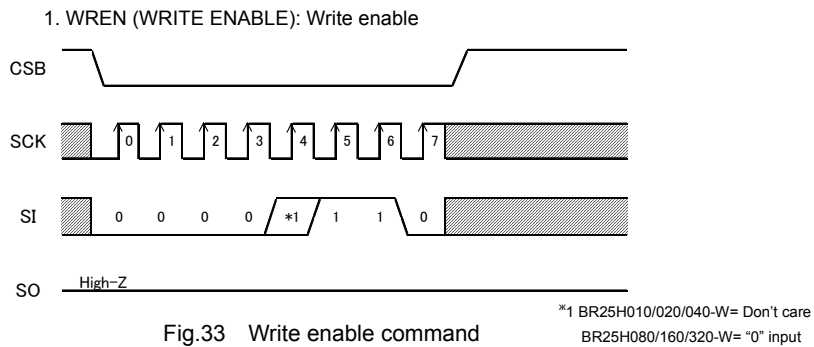

By HOLDB pin, data transfer can be interrupted. When SCK="1", by making HOLDB from "1" into "0", data transfer to EEPROM is interrupted. When SCK = "0", by making HOLDB from "0" into "1", data transfer is restarted.

● Command mode

Command		Contents	Ope code					
			BR25H010-W BR25H020-W		BR25H040-W		BR25H080-W BR25H160-W BR25H320-W	
WREN	Write enable	Write enable command	0000	*110	0000	*110	0000	0110

WRSR	Write status register	Status register write command	0000	*001	0000	*001	0000	0001

● Timing chart

1. Write enable (WREN) / disable (WRDI) cycle

○ This IC has write enable status and write disable status. It is set to write enable status by write enable command, and it is set to write disable status by write disable command. As for these commands, set CSB LOW, and then input the respective ope codes. The respective commands accept command at the 7-th clock rise. Even with input over 7 clocks, command becomes valid.

When to carry out write and write status register command, it is necessary to set write enable status by the write enable command. If write or write status register command is input in the write disable status, commands are cancelled. And even in the write enable status, once write and write status register command is executed, it gets in the write disable status. After power on, this IC is in write disable status.

2. Read command (READ)

Fig.35 Read command (BR25H010/020/040-W) *1 BR25H010/020-W=Don't care
BR25H040-W=A8

Product number	Address length
BR25H010-W	A6-A0
BR25H020-W	A7-A0
BR25H040-W	A8-A0

Fig.36 Read command (BR25H080/160/320-W) *=Don't Care

Product number	Address length
BR25H080-W	A9-A0
BR25H160-W	A10-A0
BR25H320-W	A11-A0

By read command, data of EEPROM can be read. As for this command, set CSB LOW, then input address after read ope code. EEPROM starts data output of the designated address. Data output is started from SCK fall of 15/23^{*1} clock, and from D7 to D0 sequentially. This IC has increment read function. After output of data for 1 byte (8bits), by continuing input of SCK, data of the next address can be read. Increment read can read all the addresses of EEPROM. After reading data of the most significant address, by continuing increment read, data of the most insignificant address is read.

*1 BR25H010/020/040-W=15 clocks
BR25H080/160/320-W=23 clocks

3. Write command (WRITE)

Fig.37 Write command (BR25H010/020/040-W) *1 BR25H010/020-W=Don't care
BR25H040-W=A8

Product number	Address length
BR25H010-W	A6-A0
BR25H020-W	A7-A0
BR25H040-W	A8-A0

Fig.38 Write command (BR25H080/160/320-W) *=Don't care

Product number	Address length
BR25H080-W	A9-A0
BR25H160-W	A10-A0
BR25H320-W	A11-A0

By write command, data of EEPROM can be written. As for this command, set CSB LOW, then input address and data after write ope code. Then, by making CSB HIGH, the EEPROM starts writing. The write time of EEPROM requires time of tE/W (Max 5ms). During tE/W, other than status read command is not accepted. Start CSB after taking the last data (D0), and before the next SCK clock starts. At other timing, write command is not executed, and this write command is cancelled. This IC has page write function, and after input of data for 1 byte (8 bits), by continuing data input without starting CSB, data up to 16/32^{*1} bytes can be written for one tE/W. In page write, the insignificant 4/5^{*2} bit of the designated address is incremented internally at every time when data of 1 byte is input and data is written to respective addresses. When data of the maximum bytes or higher is input, address rolls over, and previously input data is overwritten.

*1 BR25H010/020/040-W=16 bytes at maximum
BR25H080/160/320-W=32 bytes at maximum

*2 BR25H010/020/040-W=Insignificant 4 bits
BR25H080/160/320-W=Insignificant 5 bits

4. Status register write / read command

Fig.39 Status register write command (BR25H010/020/040-W) *="Don't care"

Fig.40 Status register write command (BR25H080/160/320-W) *="Don't care"

Write status register command can write status register data. The data can be written by this command are 2 bits^{*1}, that is, BP1 (bit3) and BP0 (bit2) among 8 bits of status register. By BP1 and BP0, write disable block of EEPROM can be set. As for this command, set CSB LOW, and input ope code of write status register, and input data. Then, by making CSB HIGH, EEPROM starts writing. Write time requires time of tE/W as same as write. As for CSB rise, start CSB after taking the last data bit (bit0), and before the next SCK clock starts. At other timing, command is cancelled. Write disable block is determined by BP1 and BP0, and the block can be selected from 1/4 of memory array, 1/2, and entire memory array. (Refer to the write disable block setting table.) To the write disabled block, write cannot be made, and only read can be made.

*1 3bits including BR25H080/160/320-W WPEN (bit7)

Fig.41 Status register read command (BR25H010/020/040-W) *="Don't care"

Fig.42 Status register read command (BR25H080/160/320-W)

●At standby

○Current at standby

Set CSB "H", and be sure to set SCK, SI, WPB, HOLDB input "L" or "H". Do not input intermediate electric potential.

○Timing

As shown in Fig.43, at standby, when SCK is "H", even if CSB is fallen, SI status is not read at fall edge. SI status is read at SCK rise edge after fall of CSB. At standby and at power ON/OFF, set CSB "H" status.

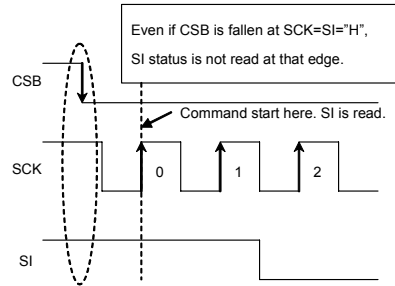

Fig.43 Operating timing

●WPB cancel valid area

WPB is normally fixed to "H" or "L" for use, but when WPB is controlled so as to cancel write status register command and write command, pay attention to the following WPB valid timing.

While write or write status register command is executed, by setting WPB = "L" in cancel valid area, command can be cancelled. The area from command ope code before CSB rise at internal automatic write start becomes the cancel valid area. However, once write is started, any input cannot be cancelled. WPB input becomes Don't Care, and cancellation becomes invalid.

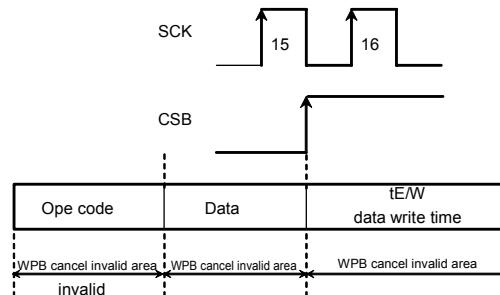

Fig.44 WPB valid timing (WRSR)

Fig.45 WPB valid timing (WRITE)

●HOLDB pin

By HOLDB pin, command communication can be stopped temporarily. (HOLD status) The HOLDB pin carries out command communications normally when it is HIGH. To get in HOLD status, at command communication, when SCK=LOW, set the HOLDB pin LOW. At HOLD status, SCK and SI become Don't Care, and SO becomes high impedance (High-Z). To release the HOLD status, set the HOLDB pin HIGH when SCK=LOW. After that, communication can be restarted from the point before the HOLD status. For example, when HOLD status is made after A5 address input at read, after release of HOLD status, by starting A4 address input, read can be restarted. When in HOLD status, leave CSB LOW. When it is set CSB=HIGH in HOLD status, the IC is reset, therefore communication after that cannot be restarted.

● Method to cancel each command

○ READ

- Method to cancel : cancel by CSB = "H"

Fig.46 READ cancel valid timing

○ RDSR

- Method to cancel : cancel by CSB = "H"

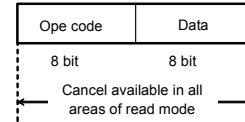

Fig.47 RDSR cancel valid timing

○ WRITE, PAGE WRITE

- a : Ope code, address input area.
Cancellation is available by CSB="H"
- b : Data input area (D7~D1 input area)
Cancellation is available by CSB="H"
- c : Data input area (D0 area)
When CSB is started, write starts.
After CSB rise, cancellation cannot be made by any means.
- d : tE/W area.
Cancellation is available by CSB = "H". However, when write starts (CSB is started) in the area c, cancellation cannot be made by any means. And by inputting on SCK clock, cancellation cannot be made. In page write mode, there is write enable area at every 8 clocks.

Fig.48 WRITE cancel valid timing

- Note 1) If Vcc is made OFF during write execution, designated address data is not guaranteed, therefore write it once again.
- Note 2) If CSB is started at the same timing as that of the SCK rise, write execution / cancel becomes unstable, therefore, it is recommended to fall in SCK = "L" area. As for SCK rise, assure timing of tCSS / tCSH or higher.

○ WRSR

- a : From ope code to 15 rise.
Cancel by CSB = "H".
- b : From 15 clock rise to 16 clock rise (write enable area).
When CSB is started, write starts.
After CSB rise, cancellation cannot be made by any means.
- c : After 16 clock rise.
Cancel by CSB="H". However, when write starts (CSB is started) in the area b, cancellation cannot be made by any means.
And, by inputting on SCK clock, cancellation cannot be made.

Fig.49 WRSR cancel valid timing

- Note 1) If Vcc is made OFF during write execution, designated address data is not guaranteed, therefore write it once again
- Note 2) If CSB is started at the same timing as that of the SCK rise, write execution / cancel becomes unstable, therefore, it is recommended to fall in SCK = "L" area. As for SCK rise, assure timing of tCSS / tCSH or higher.

○ WREN/WRDI

- a : From ope code to 7-th clock rise, cancel by CSB = "H".
- b : Cancellation is not available when CSB is started after 7-th clock.

Fig.50 WREN/WRDI cancel valid timing

● High speed operation

In order to realize stable high speed operations, pay attention to the following input / output pin conditions.

○ Input pin pull up, pull down resistance

When to attach pull up, pull down resistance to EEPROM input pin, select an appropriate value for the microcontroller VOL, IOL from VIL characteristics of this IC.

○ Pull up resistance

Fig.51 Pull up resistance

$$R_{PU} \geq \frac{V_{CC} - V_{OLM}}{I_{OLM}} \quad \dots \textcircled{1}$$

$$V_{OLM} \leq V_{ILE} \quad \dots \textcircled{2}$$

Example) When $V_{CC}=5V$, $V_{ILE}=1.5V$, $V_{OLM}=0.4V$, $I_{OLM}=2mA$, from the equation ①,

$$R_{PU} \geq \frac{5 - 0.4}{2 \times 10^{-3}}$$

$$\therefore R_{PU} \geq 2.3[k\Omega]$$

With the value of R_{pu} to satisfy the above equation, V_{OLM} becomes 0.4V or higher, and with $V_{ILE} (=1.5V)$, the equation ② is also satisfied.

- V_{ILE} :EEPROM V_{IL} specifications
- V_{OLM} :Microcontroller V_{OL} specifications
- I_{OLM} :Microcontroller I_{OL} specifications

And, in order to prevent malfunction, mistake write at power ON/OFF, be sure to make CSB pull up.

○ Pull down resistance

Fig.52 Pull down resistance

$$R_{PD} \geq \frac{V_{OHM}}{I_{OHM}} \quad \dots \textcircled{3}$$

$$V_{OHM} \geq V_{IHE} \quad \dots \textcircled{4}$$

Example) When $V_{CC}=5V$, $V_{OHM}=V_{CC}-0.5V$, $I_{OHM}=0.4mA$, $V_{IHE}=V_{CC} \times 0.7V$, from the equation ③,

$$R_{PD} \geq \frac{5 - 0.5}{0.4 \times 10^{-3}}$$

$$\therefore R_{PD} \geq 11.3[k\Omega]$$

Further, by amplitude V_{IHE} , V_{ILE} of signal input to EEPROM, operation speed changes. By inputting signal of amplitude of V_{CC} / GND level to input, more stable high speed operations can be realized. On the contrary, when amplitude of $0.8V_{CC} / 0.2V_{CC}$ is input, operation speed becomes slow.

In order to realize more stable high speed operation, it is recommended to make the values of R_{PU} , R_{PD} as large as possible, and make the amplitude of signal input to EEPROM close to the amplitude of V_{CC} / GND level.

(*1 At this moment, operating timing guaranteed value is guaranteed.)

Fig.53 VIL dependency of data output delay time

○SO load capacity condition

Load capacity of SO output pin affects upon delay characteristic of SO output. (Data output delay time, time from HOLDB to High-Z) In order to make output delay characteristic into higher speed, make SO load capacity small. In concrete, “Do not connect many devices to SO bus”, “Make the wire between the controller and EEPROM short”, and so forth.

Fig.54 SO load dependency of data output delay time

○Other cautions

Make the wire length from the microcontroller to EEPROM input signal same length, in order to prevent setup / hold violation to EEPROM, owing to difference of wire length of each input.

●Notes on power ON/OFF

○At power ON/OFF, set CSB "H" (=Vcc).

When CSB is "L", this IC gets in input accept status (active). If power is turned on in this status, noises and the likes may cause malfunction, mistake write or so. To prevent these, at power ON, set CSB "H". (When CSB is in "H" status, all inputs are canceled.)

Fig.61 CSB timing at power ON/OFF

(Good example) CSB terminal is pulled up to Vcc.

At power OFF, take 10ms or higher before supply. If power is turned on without observing this condition, the IC internal circuit may not be reset, which please note.

(Bad example) CSB terminal is "L" at power ON/OFF.

In this case, CSB always becomes "L" (active status), and EEPROM may have malfunction, mistake write owing to noises and the likes.

Even when CSB input is High-Z, the status becomes like this case, which please note.

○LVCC circuit

LVCC (Vcc-Lockout) circuit prevents data rewrite action at low power, and prevents wrong write.

At LVCC voltage (Typ. =1.9V) or below, it prevent data rewrite.

○P.O.R. circuit

This IC has a POR (Power On Reset) circuit as mistake write countermeasure. After POR action, it gets in write disable status. The POR circuit is valid only when power is ON, and does not work when power is OFF. When power is ON, if the recommended conditions of the following t_R , t_{OFF} , and V_{bot} are not satisfied, it may become write enable status owing to noises and the likes.

Fig.62 Rise waveform

Recommended conditions of t_R , t_{OFF} , V_{bot}

t_R	t_{OFF}	V_{bot}
10ms or below	10ms or higher	0.3V or below
100ms or below	10ms or higher	0.2V or below

●Noise countermeasures

○Vcc noise (bypass capacitor)

When noise or surge gets in the power source line, malfunction may occur, therefore, for removing these, it is recommended to attach a bypass capacitor (0.1 μ F) between IC Vcc and GND. At that moment, attach it as close to IC as possible.

And, it is also recommended to attach a bypass capacitor between board Vcc and GND.

○SCK noise

When the rise time (t_R) of SCK is long, and a certain degree or more of noise exists, malfunction may occur owing to clock bit displacement.

To avoid this, a Schmitt trigger circuit is built in SCK input. The hysteresis width of this circuit is set about 0.2V, if noises exist at SCK input, set the noise amplitude 0.2Vp-p or below. And it is recommended to set the rise time (t_R) of SCK 100ns or below. In the case when the rise time is 100ns or higher, take sufficient noise countermeasures. Make the clock rise, fall time as small as possible.

○WPB noise

During execution of write status register command, if there exist noises on WPB pin, mistake in recognition may occur and forcible cancellation may result, which please note. To avoid this, a Schmitt trigger circuit is built in WPB input. In the same manner, a Schmitt trigger circuit is built in SI input and HOLDB input too.

●Cautions on use

(1)Described numeric values and data are design representative values, and the values are not guaranteed.

(2)We believe that application circuit examples are recommendable, however, in actual use, confirm characteristics further sufficiently. In the case of use by changing the fixed number of external parts, make your decision with sufficient margin in consideration of static characteristics and transition characteristics and fluctuations of external parts and our LSI.

(3)Absolute maximum ratings

If the absolute maximum ratings such as impressed voltage and operating temperature range and so forth are exceeded, LSI may be destructed. Do not impress voltage and temperature exceeding the absolute maximum ratings. In the case of fear exceeding the absolute maximum ratings, take physical safety countermeasures such as fuses, and see to it that conditions exceeding the absolute maximum ratings should not be impressed to LSI.

(4)GND electric potential

Set the voltage of GND terminal lowest at any action condition. Make sure that each terminal voltage is lower than that of GND terminal.

(5)Heat design

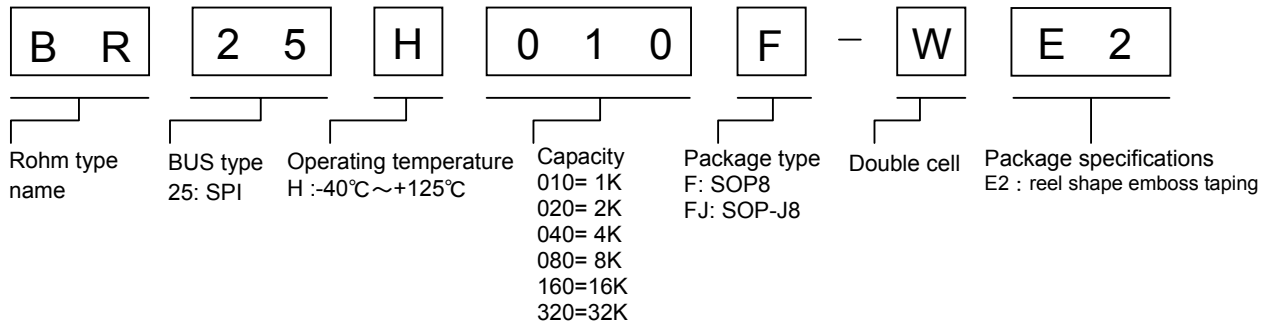

In consideration of permissible dissipation in actual use condition, carry out heat design with sufficient margin.

(6)Terminal to terminal short circuit and wrong packaging

When to package LSI onto a board, pay sufficient attention to LSI direction and displacement. Wrong packaging may destruct LSI. And in the case of short circuit between LSI terminals and terminals and power source, terminal and GND owing to foreign matter, LSI may be destructed.

(7)Use in a strong electromagnetic field may cause malfunction, therefore, evaluate design sufficiently.

SOP8/SOP-J8

- The contents described herein are correct as of April, 2005
- The contents described herein are subject to change without notice. For updates of the latest information, please contact and confirm with ROHM CO.,LTD.
- Any part of this application note must not be duplicated or copied without our permission.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams and information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO.,LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resale or otherwise dispose of the same, implied right or license to practice or commercially exploit any intellectual property rights or other proprietary rights owned or controlled by ROHM CO., LTD. is granted to any such buyer.
- The products described herein utilize silicon as the main material.
- The products described herein are not designed to be X ray proof.

The products listed in this catalog are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys). Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of which would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.
