54F/74F322
Octal Serial/Parallel Register with Sign Extend

General Description

The 'F322 is an 8-bit shift register with provision for either serial or parallel loading and with TRI-STATE® parallel outputs plus a bi-state serial output. Parallel data inputs and parallel outputs are multiplexed to minimize pin count. State changes are initiated by the rising edge of the clock. Four synchronous modes of operation are possible: hold (store), shift right with serial entry, shift right with sign extend and parallel load. An asynchronous Master Reset ($\overline{MR}$) input overrides clocked operation and clears the register.

Features

- Multiplexed parallel I/O ports
- Separate serial input and output
- Sign extend function
- TRI-STATE outputs for bus applications

Functional Description

The ’F322 contains eight D-type edge triggered flip-flops and the interstage gating required to perform right shift and the intrastage gating necessary for hold and synchronous parallel load operations. A LOW signal on $\overline{RE}$ enables shifting or parallel loading, while a HIGH signal enables the hold mode. A HIGH signal on S/$\overline{P}$ enables shift right, while a LOW signal disables the TRI-STATE output buffers and enables parallel loading. In the shift right mode a HIGH signal on $\overline{SE}$ enables serial entry from either D_0 or D_1, as determined by the S input. A LOW signal on $\overline{SE}$ enables shift right but Q_7 reloads its contents, thus performing the sign extend function required for the ’F384 Twos Complement Multiplier. A HIGH signal on $\overline{OE}$ disables the TRI-STATE output buffers, regardless of the other control inputs. In this condition the shifting and loading operations can still be performed.

*When the $\overline{OE}$ input is HIGH all I/O_n terminals are at the high impedance state; sequential operation or clearing of the register is not affected.

Note 1: I_7–I_0 = The level of the steady-state input at the respective I/O terminal is loaded into the flip-flop while the flip-flop outputs (except Q_0) are isolated from the I/O terminal.

Note 2: D_0, D_1 = The level of the steady-state inputs to the serial multiplexer input.

Note 3: O_7–O_0 = The level of the respective Q_n flip-flop prior to the last Clock LOW-to-HIGH transition.

H = HIGH Voltage Level
L = LOW Voltage Level
Z = High Impedance Output State
⌐⌐ = LOW-to-HIGH Transition
NC = No Change

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Storage Temperature	−65°C to +150°C
Ambient Temperature under Bias	−55°C to +125°C
Junction Temperature under Bias	−55°C to +175°C
Plastic	−55°C to +150°C
V_{CC} Pin Potential to Ground Pin	−0.5V to +7.0V
Input Voltage (Note 2)	−0.5V to +7.0V
Input Current (Note 2)	−30 mA to +5.0 mA
Voltage Applied to Output in HIGH State (with V_{CC} = 0V)	
Standard Output	−0.5V to V_{CC}
TRI-STATE Output	−0.5V to +5.5V
Current Applied to Output in LOW State (Max)	twice the rated I_{OL} (mA)

Note 1: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Either voltage limit or current limit is sufficient to protect inputs.
