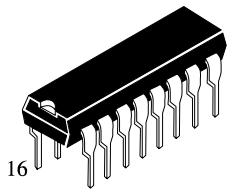
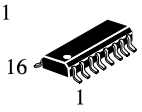
IN74HC192

Presettable BCD/Decade UP/DOWN Counter

High-Performance Silicon-Gate CMOS



N SUFFIX
PLASTIC



D SUFFIX
SOIC

ORDERING INFORMATION

IN74HC192N Plastic
IN74HC192D SOIC
T_A = -55° to 125° C for all packages

The IN74HC192 is identical in pinout to the LS/ALS192. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LS/ALSTTL outputs.

The counter has two separate clock inputs, a Count Up Clock and Count Down Clock inputs. The direction of counting is determined by which input is clocked. The outputs change state synchronous with the LOW-to-HIGH transitions on the clock inputs. This counter may be preset by entering the desired data on the P0, P1, P2, P3 input. When the Parallel Load input is taken low the data is loaded independently of either clock input. This feature allows the counters to be used as devide-by-n by modifying the count lenght with the preset inputs. In addition the counter can also be cleared. This is accomplished by inputting a high on the Master Reset input. All 4 internal stages are set to low independently of either clock input.Both a Terminal Count Down (TC_D) and Terminal Count Up (TC_U) Outputs are provided to enable cascading of both up and down counting functions. The TC_D output produces a negative going pulse when the counter underflows and TC_U outputs a pulse when the counter overflows. The counter can be cascaded by connecting the TC_U and TC_D outputs of one device to the Count Up Clock and Count Down Clock inputs, respectively, of the next device.

- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: 1.0 µA
- High Noise Immunity Characteristic of CMOS Devices

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{IN} and V_{OUT} should be constrained to the range GND≤(V_{IN} or V_{OUT})≤V_{CC}.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

X = don't care

The IN74HC192 can be preset to any state, but will not count beyond 9. If preset to state 10, 11, 12, 13, 14 or 15, it will follow the sequence 10, 11, 6: 12, 13, 4: 14, 15, 2 if counting Up, and follow the sequence 15, 14, 13, 12, 11, 10, 9 if counting Down.

Logic equations

For Terminal Count:

$\overline{TC_U} = Q_0 \bullet Q_3 \bullet \overline{CP_U}$

$\overline{TC_D} = \overline{Q_0} \bullet \overline{Q_1} \bullet \overline{Q_2} \bullet \overline{Q_3} \bullet \overline{CP_D}$
