

Asynchronous Silicon Gate CMOS LSI

	No. 4326	LC3664BL, BML-70/85/10/12
		64 K (8192 words x 8 bits) SRAM

Overview

The LC3664BL, BML-70/85/10/12 are fully asynchronous silicon gate CMOS static RAMs with an 8192 words x 8 bits.

This series has $\overline{CE1}$ and CE2 chip enable pins for device select/nonselect control and an \overline{OE} output enable pin for output control, and features high speed as well as low power dissipation.

For these reasons, the series is especially suited for use in systems requiring high speed, low power, and battery backup, and it is easy to expand memory capacity.

- Notes
- (1) t_{COD1} , t_{COD2} , t_{OOD} , and t_{WOD} are defined as the time at which the outputs becomes the high impedance state and are not referred to output voltage levels.
 - (2) An external antiphase signal must not be applied when DOUT is in the output state.
 - (3) t_{WP} is the time interval that $\overline{\text{CE1}}$ and $\overline{\text{WE}}$ are low-level and CE2 is high-level, and is defined as the interval from the falling of $\overline{\text{WE}}$ to the rising of $\overline{\text{CE1}}$ or $\overline{\text{WE}}$, or the falling of CE2, whichever is earlier.
 - (4) t_{CW1} and t_{CW2} are the time interval that $\overline{\text{CE1}}$ and $\overline{\text{WE}}$ are low-level and CE2 is high-level, and is defined as the time from the falling of $\overline{\text{CE1}}$ or the rising of CE2 to the rising of $\overline{\text{CE1}}$ or $\overline{\text{WE}}$, or the falling of CE2, whichever is earlier.
 - (5) DOUT goes to the high-impedance state when either $\overline{\text{OE}}$ is high-level, $\overline{\text{CE1}}$ is high-level, CE2 is low-level, or $\overline{\text{WE}}$ is low-level.
 - (6) When $\overline{\text{OE}}$ is high-level during the write cycle, DOUT goes to the high-impedance state.
