USING THIS DOCUMENT

This document is intended for the hardware and software engineer's general information on the Realtek ALC260(D) audio codec chip.

Though every effort has been made to ensure that this document is current and accurate, more information may have become available subsequent to the production of this guide. In that event, please contact your Realtek representative for additional information that may help in the development process.

REVISION HISTORY

Revision	Release Date	Summary
1.0	2004/07/20	Preliminary release.
1.1	2004/09/29	First official release. Add HDA 1.0 compliant part number (Table 83, page 72).
1.2	2004/11/08	Updated to reflect modifications in ALC260, ALC260-VD, ALC260-VD-LF, ALC260-VE, ALC260-VE-LF. 1. Power-Off CD mode supported only in ALC260 & ALC260-LF. 2. Parameter 'subsystem ID' is read as 0s (Table 19, page 19). 3. Verb 'subsystem verb' is supported (Table 73, page 62, and Table 74, page 63).
1.3	2005/03/03	Add lead (Pb)-free and version package identification information on page 5 and in Table 83, on page 72. Add new versions with Dolby® Digital Live (see Table 83, page 72).
1.4	2005/08/15	Update section 9.1.1 Absolute Maximum Ratings, page 64 AVDD support range. Add a note to section 12 Ordering Information, page 72.

1. General Description

The ALC260 and ALC260D* 2-Channel High Definition Audio (HDA) Codecs with UAA (Universal Audio Architecture), featuring a 24-bit two-channel DAC and two stereo 20-bit ADCs, are designed for commercial Desktop and Notebook PC systems. The codecs incorporate proprietary converter technology to achieve 95dB sound quality; easily meeting PC2001 requirements and also bringing PC sound quality closer to consumer electronic devices.

The ALC260(D) provides 2 output channels, along with flexible mixing, mute, and fine gain control functions to provide a complete integrated audio solution for PCs. The DAC (with a highest sampling frequency of 192kHz) was previously only implemented in high-end consumer electronics, but is now achieved by PCs equipped with the ALC260(D). The ALC260(D) provides high-quality audio using S/PDIF to output analog data, or for multiple-source recording applications.

Realtek's proprietary impedance sensing and jack detect techniques allow device loads on inputs and outputs to be auto-detected. All analog IO are input and output capable, headphone amplifiers are also integrated at each analog output. All analog IOs can be re-tasked according to user's definitions, or automatically switched depending on the connected device type (Universal Audio Jack®).

The ALC260(D) supports 32-bit S/PDIF input and output functions and a sampling rate of up to 96kHz, offering easy connection of PCs to high-quality consumer electronic products such as AC-3 decoders/speakers, and mini disk devices.

The ALC260(D) supports host/soft audio from the Intel ICH6 chipset, and also from any other HDA compatible audio controller. With power management setting, Realtek's unique microphone application (AEC/Beam Forming/Noise Suppression), optional Dolby® Digital Live, and reliable driver support, the ALC260(D) is the ideal choice for Commercial Desktop and Notebook PC users.

Note: 'D' directly after ALC260 indicates Dolby® Digital Live (software feature). See Table 83, page 72.

2. Features

2.1. Hardware Features

- Single-chip multi-bit Sigma-Delta converters with high S/N ratio
- 1 stereo DAC supports 16/20/24-bit PCM format with 44.1/48/96/192kHz sample rate
- 2 stereo ADCs support 16/20-bit PCM format with 44.1/48/96kHz sample rate
- Applicable for 2-Channel 192kHz DVD-Audio solutions
- LINE-OUT, HP-OUT, LINE1, LINE2, MIC1, and MIC2 are stereo input and output re-tasking
- MONO line level output to subwoofer speaker for 2.1 channel applications
- High-quality differential CD analog input
- External PCBEEP input is applicable, and internal BEEP generator is integrated
- Power-Off CD mode supported (Only in ALC260 & ALC260-LF)
- Power management and enhanced power saving features
- Power support: Digital: 3.3V; Analog: 3.8V/5.0V
- Selectable 2.5V/3.75V VREFOUT
- Two jack detection pins (each designed to detect 4 jacks)
- Supports 44.1/48/96/192kHz S/PDIF output
- Supports 44.1/48/96kHz S/PDIF input
- 48-pin LQFP packages (lead (Pb)-free packages also available)
- Supports external volume knob control
- External PCBEEP Pass-Through when link is in RESET state (Not supported in the ALC260(D)-VE and ALC260(D)-VE-LF)
- Reserve analog mixer architecture is backwards compatible with AC'97
- –64dB ~ +30dB with 1dB mixer gain resolution for finer volume control
- Impedance sensing capability for each re-tasking jack
- Built-in headphone amplifier for each re-tasking jack
- Supports external volume knob control
- Supports GPIO (General Purpose Input/Output) for customized applications

2.2. Software Features

- Meets Microsoft WHQL/WLP 2.0 audio requirements
- EAX™ 1.0 & 2.0 compatible
- Direct Sound 3D™ compatible
- A3D™ compatible
- I3DL2 compatible
- HRTF 3D Positional Audio
- Emulation of 26 sound environments to enhance gaming experience
- 10-band Software Equalizer
- Voice Cancellation and Key Shifting in Karaoke mode
- Realtek Media Player
- Enhanced Configuration Panel and device sensing wizard to improve user experience
- Content Copy Protection for S/PDIF interface
- Power Management setting
- Microphone Acoustic Echo Cancellation (AEC) and Beam Forming (BF) technology for voice application
- Mono/Stereo Microphone Noise Suppression
- ALC260D, ALC260D-LF, ALC260D-VE, and ALC260D-VE-LF feature Dolby® Digital Live

3. System Applications

- Multimedia PCs
- 3D PC Games
- Information Appliances (IA)
- Voice Recognition
- Audio Conferencing

CD-R	I	20	CD input right channel	Analog input. 1.6Vrms of full scale input
MIC1-L	IO	21	1st stereo microphone input left channel	Analog input/output. Default is input (JACK -B)
MIC1-R	IO	22	1st stereo microphone input right channel	Analog input/output. Default is input (JACK -B)
LINE1-L	IO	23	1st line input left channel	Analog input/output. Default is input (JACK -C)
LINE1-R	IO	24	1st line input right channel	Analog input/output. Default is input (JACK -C)

Name	Type	Pin #	Description	Characteristic Definition
LINE-OUT-L	IO	35	Secondary out left channel	Analog output (JACK -D)
LINE-OUT-R	IO	36	Secondary out right channel	Analog output (JACK -D)
HP-OUT-L	IO	39	First out left channel	Analog output (JACK -A)
HP-OUT-R	IO	41	First out right channel	Analog output (JACK -A)
MONO-OUT	O	37	MONO output	Analog mono output is summation of (L+R)/2.
Sense A	I	13	Jack Detect pin 1	Analog DC input from 0V~5.0V
Sense B	I	34	Jack Detect pin 2	Analog DC input from 0V~5.0V
DCVOL	I	33	DC sense for volume control	Analog DC input from 0V~5.0V
				Total: 20 Pins

6.3. Filter/Reference

Table 3. Filter/Reference

Name	Type	Pin #	Description	Characteristic Definition

7. High Definition Audio Link Protocol

7.1. Link Signals

The High Definition Audio (HDA) Link is the digital serial interface that connects the HDA codecs to the HDA Controller. The HDA link protocol is controller synchronous, based on a 24.0MHz BIT-CLK sent by the HDA controller. The input and output streams, including command and PCM data, are isochronous with a 48kHz frame rate. Figure 4 shows the basic concept of the HDA link protocol.

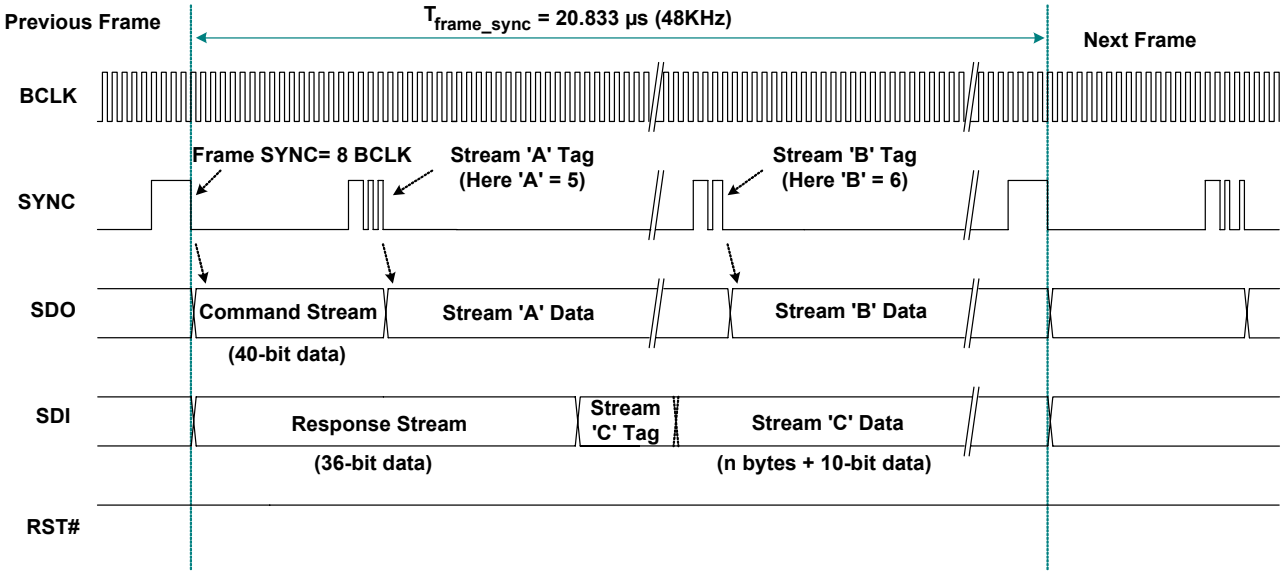

Figure 4. HDA Link Protocol

7.1.1. Signal Definitions

Table 5. Link Signal Definitions

Item	Description
BCLK	24.0MHz bit-clock sourced from the HDA controller and connecting to all codecs.
SYNC	48kHz signal is used to synchronize input and output streams on the link. It is sourced from the HDA controller and connects to all codecs.
SDO	Serial data output signal driven by the HDA controller to all codecs. Commands and data streams are carried on SDO. The data rate is double pumped; the controller drives data onto the SDO, the codec samples data present on SDO with respect to each edge of BCLK. The HDA controller must support at least one SDO. To extend outbound bandwidth, multiple SDOs may be supported.
SDI	Serial data input signal driven by the codec. This is point-to-point serial data from the codec to the HDA controller. The controller must support at least one SDI. Up to a maximum of 15 SDI's can be supported. SDI is driven by the codec at each rising edge of BCLK, and sampled by the controller at each rising edge of BCLK. SDI can be driven by the controller to initialize the codec's ID.
RST#	Active low reset signal. Asserted to reset the codec to default power on state. RST# is sourced from the HDA controller and connects to all codecs.

Table 6. HDA Signal Definitions

Signal Name	Source	Type for Controller	Description
BCLK	Controller	Output	Global 24.0MHz bit clock.
SYNC	Controller	Output	Global 48kHz Frame Sync and outbound tag signal.
SDO	Controller	Output	Serial data output from controller.
SDI	Codec/Controller	Input/Output	Serial data input from codec. Weakly pulled down by the controller.
RST#	Controller	Output	Global active low reset signal.

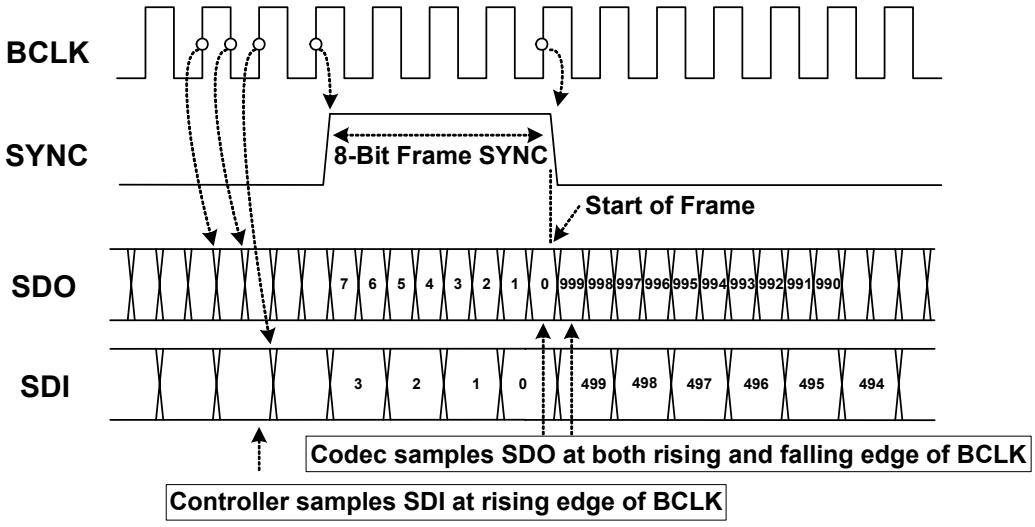

Figure 5. Bit Timing

7.1.2. Signaling Topology

The HDA controller supports two SDOs for the outbound stream, up to 15 SDIs for the inbound stream. RST#, BCLK, SYNC, SDO0 and SDO1 are driven by the controller to codecs. Each codec drives its own point-to-point SDI signal(s) to the controller.

Figure 6 shows the possible connections between the HDA controller and codecs:

1. Codec 0 is a basic connection. There is one single SDO and one single SDI for normal transmission
2. Codec 1 has two SDOs for doubled outbound rate, a single SDI for normal inbound rate
3. Codec 3 supports a single SDO for normal outbound rate, and two SDIs for doubled inbound rate
4. Codec N has two SDOs and multiple SDIs

The multiple SDOs and multiple SDIs are used to expand the transmission rate between controller and codecs. The following section 'Frame Composition', describes the detailed outbound and inbound stream compositions for single and multiple SDOs/SDIs.

The connections shown in Figure 6 can be implemented concurrently in an HDA system. The ALC260(D) is designed to receive a single SDO stream.

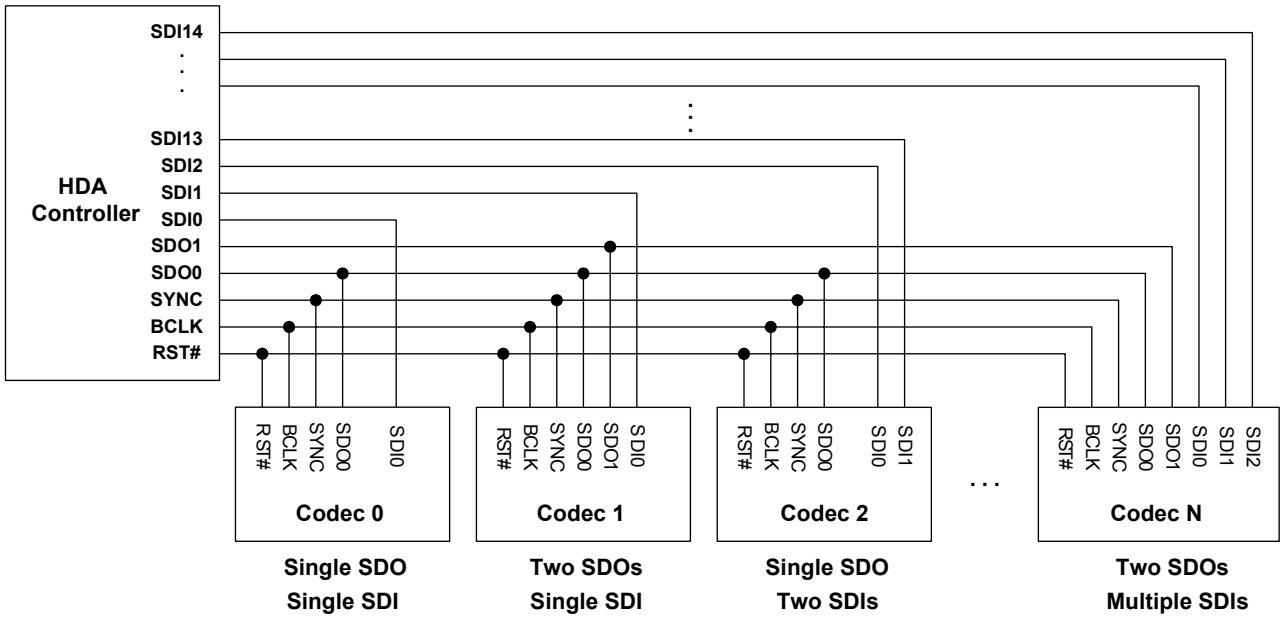

Figure 6. Signaling Topology

7.2. Frame Composition

7.2.1. Outbound Frame – Single SDO

An outbound frame is composed of one 32-bit command stream and multiple data streams. There are one or multiple sample blocks in a data stream. Only one sample block exists in a stream if the HDA controller delivers a 48kHz rate of samples to the codec. Multiple sample blocks in a stream means the sample rate is a multiple of 48kHz. This means there should be 2 blocks in the same stream to carry 96kHz samples (Figure 7).

For outbound frames, the stream tag is not in SDO, but in the SYNC signal. A new data stream is started at the end of the stream tag. The stream tag includes a 4-bit preamble and 4-bit stream ID (Figure 8).

To keep the cadence of converters bound to the same stream, samples for these converters must be placed in the same block.

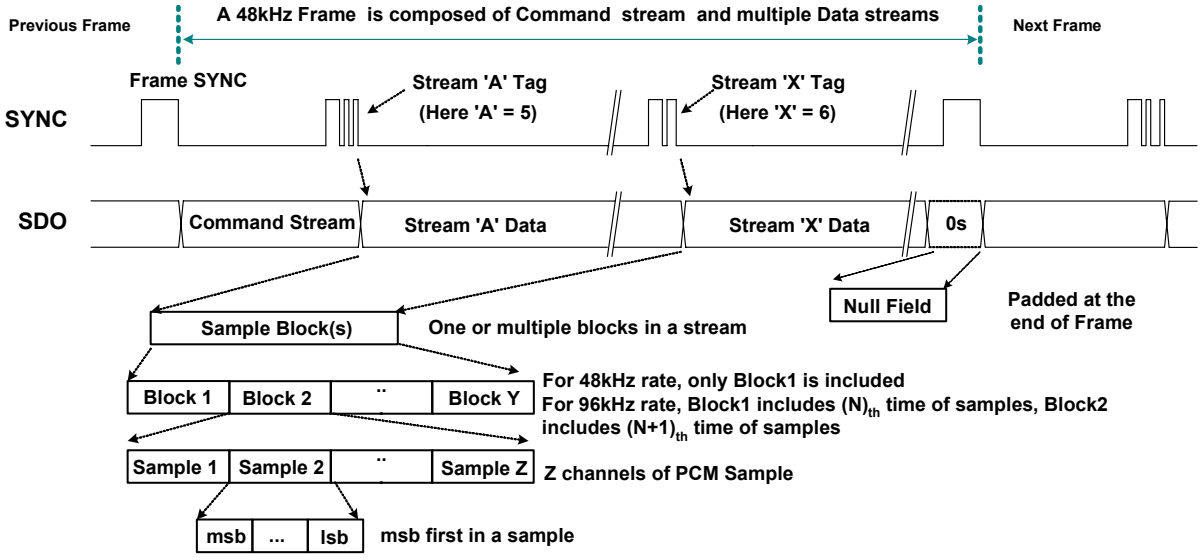

Figure 7. SDO Outbound Frame

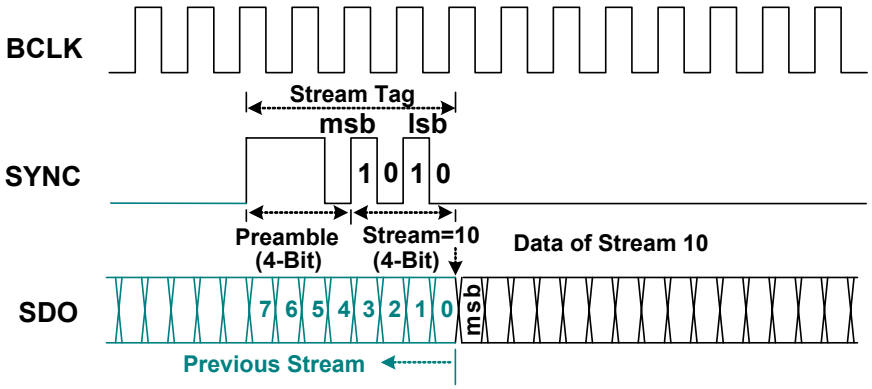

Figure 8. SDO Stream Tag is Indicated in SYNC

7.2.2. Inbound Frame – Single SDI

An Inbound Frame – Single SDI is composed of one 36-bit response stream and multiple data streams. Except for the initialization sequence (turnaround and address frame), SDI is driven by the codec at each rising edge of BCLK. The controller also samples data at the rising edge of BCLK (Figure 9).

The SDI stream tag is not carried by SYNC, but included in the SDI. A complete SDI data stream includes one 4-bit stream tag, one 6-bit data length, and n-bit sample blocks. Zeros will be padded if the total length of the contiguous sample blocks within a given stream is not of integral byte length (Figure 10).

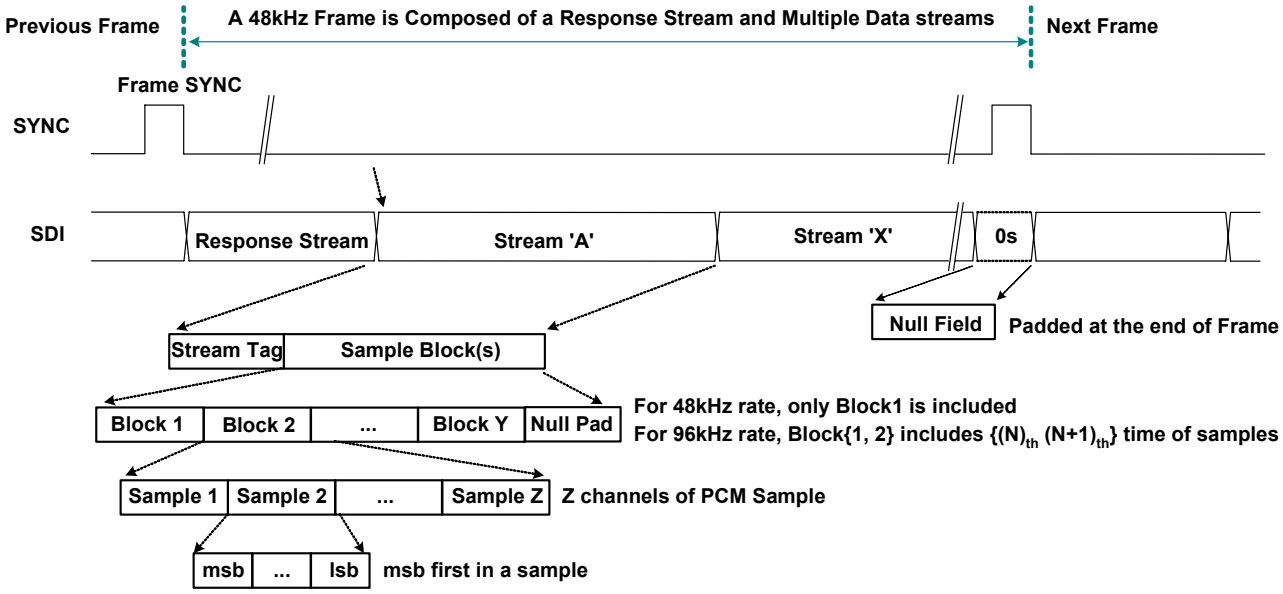

Figure 9. SDI Inbound Stream

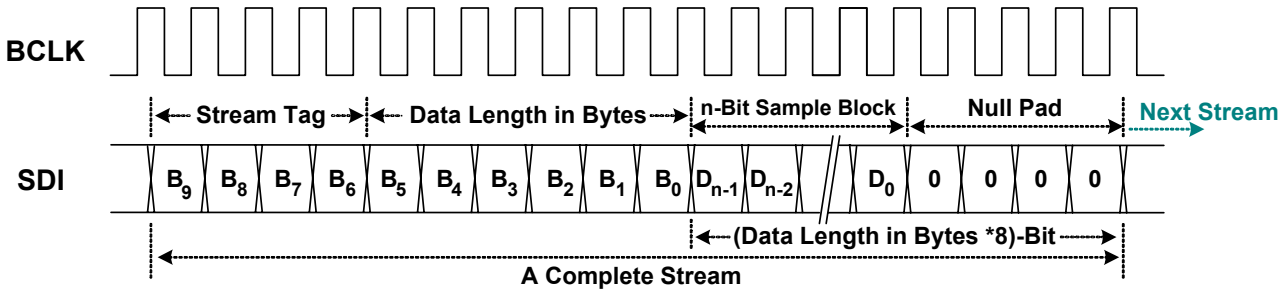

Figure 10. SDI Stream Tag and Data

7.2.3. Variable Sample Rates

The HDA link is designed for sample rates of 48kHz. Variable sample rates are delivered in multiple or sub-multiple rates of 48kHz. Two sample blocks per frame result in a 96kHz delivery rate. One sample block over two frames results in a 24kHz delivery rate. The HDA specification states that the sample rate of the outbound stream be synchronized by the controller, not by the codec. Each stream has its own sample rate, independent of any other stream.

The HDA controller supports 48kHz and 44.1kHz base rates. Table 7 shows the recommended sample rates based on multiples or sub-multiples of one of the two base rates.

Rates in sub-multiples (1/n) of 48kHz are interleaving n frames containing no sample blocks. Rates in multiples (n) of 48kHz contain n sample blocks in a frame. Table 8 shows the delivery cadence of variable rates based on 48kHz.

The HDA link is defined to operate at a fixed 48kHz frame rate. To deliver samples in (sub) multiple rates of 44.1kHz, an appropriate ratio between 44.1kHz and 48kHz must be maintained to avoid frequency drift. The appropriate ratio between 44.1kHz and 48kHz is 147/160. Meaning 147 sample blocks are transmitted every 160 frames.

The cadence '12-11-11-12-11-11-12-11-11-12-11-11-11- (repeat)', interleaves 13 frames containing no sample blocks in every 160 frames. It provides a low long-term frequency drift for 44.1kHz of delivery rate. Rates in sub-multiples (1/n) of 44.1kHz also follow this cadence AND interleave n empty frames. Rates in multiples (n) of 44.1kHz applying this cadence contain n sample blocks in the non-empty frame AND interleave an empty frame between non-empty frames (Table 9, page 14).

Table 7. Defined Sample Rate and Transmission Rate

7.3. Reset and Initialization

There are two types of reset within an HDA link:

- Link Reset: Generated by assertion of the RST# signal; all codecs return to their power-on state
- Codec Reset: Generated by software; directs a command to reset a specific codec back to its default state

An initialization sequence is requested after any of the following three events:

1. Link Reset
2. Codec Reset
3. Codec changes its power state (e.g., hot docking a codec to an HDA system)

7.3.1. Link Reset

A link reset may be caused by 3 events:

1. The HDA controller asserts RST# for any reason (power up, or PCI reset)
2. Software initiates a link reset via the 'CRST' bit in the Global Control Register (GCR) of the HDA controller
3. Software initiates power management sequences. Figure 11, page 15, shows the 'Link Reset' timing including the 'Enter' sequence (❶~❺) and 'Exit' sequence (❻~❾)

Enter 'Link Reset':

❶ Software writes a 0 to the 'CRST' bit in the Global Control Register of the HDA controller to initiate a link reset

❷ As the controller completes the current frame, it does not signal the normal 8-bit frame SYNC at the end of the frame

❸ The controller drives SYNC and all SDOs to low. Codecs also drive SDIs to low

❹ The controller asserts the RST# signal to low, and enters the 'Link Reset' state

❺ All link signals driven by controller and codecs should be tri-state by internal pull low resistors

Exit from 'Link Reset':

❻ BCLK is re-started for any reason (codec wake-up event, power management, etc.)

❼ Software is responsible for de-asserting RST# after a minimum of 100µsec BCLK running time (the 100µsec provides time for the codec PLL to stabilize)

❽ Minimum of 4 BCLK after RST# is de-asserted, the controller starts to signal normal frame SYNC

❾ When the codec drives it's SDI to request an initialization sequence (when the SDI is driven high at the last bit of frame SYNC), it means the codec requests an initialization sequence)

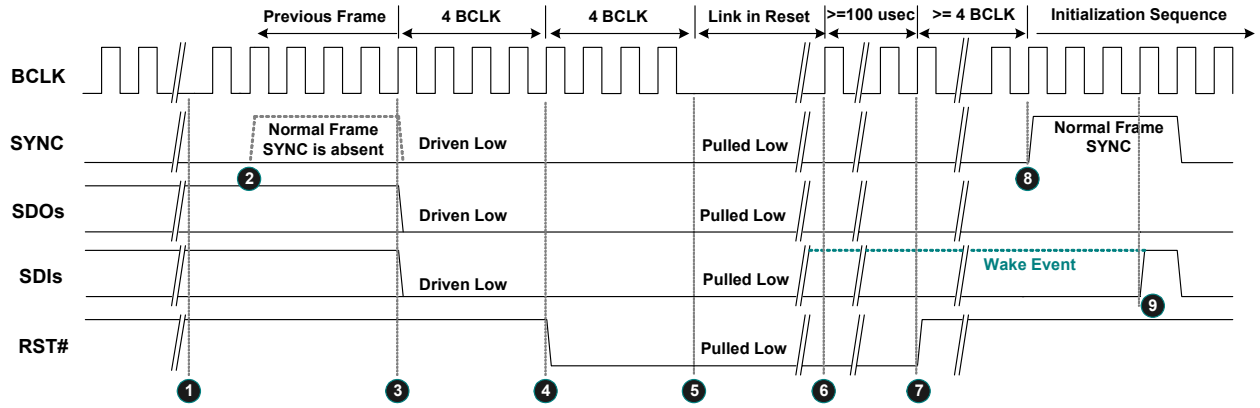

Figure 11. Link Reset Timing

7.3.2. Codec Reset

A 'Codec Reset' is initiated via the Codec RESET command verb. It results in the target codec being reset to the default state. After the target codec completes its reset operation, an initialization sequence is requested.

7.3.3. Codec Initialization Sequence

❶ The codec drives SDI high at the last bit of SYNC to request a Codec Address (CAD) from the controller

❷ The codec will stop driving the SDI in this turnaround period

❸❹❺❻ The controller drives the SDI to assign a CAD to the codec

❼ The controller releases SDI after the CAD has been assigned

❽ Normal operation state

7.4. Verb and Response Format

7.4.1. Command Verb Format

There are two types of verbs: one with 4-bit identifiers (4-bit verbs) and 16-bits of data, the other with 12-bit identifiers (12-bit verbs) and 8-bits of data. Table 10 shows the 4-bit verb structure of a command stream sent from the controller to operate the codec.

Table 11 is the 12-bit verb structure that gets and controls parameters in the codec.

Table 10. 40-Bit Commands in 4-Bit Verb Format

7.4.2. Response Format

There are two types of response from the codec to the controller. Solicited Responses are returned by the codec in response to a current command verb. The codec will send Solicited Response data in the next frame, without regard to the Set (Write) or Get (Read) command. The 32-bit Response is interpreted by software, opaque to the controller.

Unsolicited Responses are sent by the codec independently of software requests. Jack Detection or GPI status information can be actively delivered to the controller and interpreted by software. The 'Tag' in Bit [31:28] is used to identify unsolicited events. This tag is undefined in the HDA specifications.

Table 12. Solicited Response Format

Bit [35]	Bit [34]	Bit [33:32]	Bit [31:0]

Bit [35]	Bit [34]	Bit [33:32]	Bit [31:26]	Bit [27:0]
Valid	Unsol=1	Reserved	Tag[5:0]	Response

Note: The response stream in the link protocol is 36-bits wide. The response is placed in the lower 32-bit field. Bit-35 is a 'Valid' bit to indicate the response is 'Ready'. Bit-34 is set to indicate that an unsolicited response was sent.

7.5. Power Management

The ALC260(D) does not support Wake-Up events when in low-power mode. All power management state changes in widgets are driven by software. Table 14 shows the System Power State Definitions.

In the ALC260(D), only the audio function (NID=01h) supports power control. Software may have various power states depending on system configuration. Table 15 indicates those nodes that support power management. To simplify power control, software can configure whole codec power states through the audio function (NID=01h). Output converters (DACs) and input converters (ADCs) have no individual power control.

Table 14. System Power State Definitions

Power States	Definitions
D0	All power on. Individual DACs and ADCs can be powered up or down as required.
D1	All amplifiers and converters (DACs and ADCs) are powered down. State maintained; analog reference stays up.
D2	All amplifiers and converters (DACs and ADCs) are powered down. State maintained, but analog reference off (D1 + analog reference off).
D3 (Hot)	Power still supplied. The codec stops the internal clock. State is maintained.
D3 (Cold)	All power removed. State lost.

8. Supported Verbs and Parameters

This section describes the Verbs and Parameters supported by various widgets in the ALC260(D). If a verb is not supported by the addressed widget, it will respond with 32 bits of '0'.

Refer to Figure 1, page 4, to get the NID (Node ID) assigned for each widget.

8.1. Verb – Get Parameters (Verb ID=F00h)

The 'Get Parameters' verb is used to get system information and the function capabilities of the HDA codec. All the parameters are read-only. There are a total of 15 ID parameters defined for each widget; some parameters are supported only in a specific widget. Refer to section 7.4.1 Command Verb Format, page 17, to get detailed information about supported parameters.

Bit	Description
31:16	Reserved. Read as 0's.
15:8	VREF Control Capability. '1' in corresponding bit field indicates signal levels of associated Vrefout are specified as a percentage of AVDD.
7	L-R Swap. Indicates the capability of swapping the left and rights. Not supported. This bit is read as 0.
6	Balanced I/O Pin. '1' indicates this pin complex has balanced pins.
5	Input Capable. '1' indicates this pin complex supports input.
4	Output Capable. '1' indicates this pin complex supports output.
3	Headphone Drive Capable. '1' indicates this pin complex has an amplifier to drive a headphone.

7:6	5	4	3	2	1	0
Reserved	100%	80%	Reserved	Ground	50%	Hi-Z

Codec Response Format

Bit	Description
2	Presence Detect Capable. '1' indicates this pin complex can detect whether there is anything plugged in. Uses dedicated Jack-Detect pins to detect when a jack is plugged in.
1	Trigger Required. '1' indicates whether a software trigger is required for an impedance measurement.
0	Impedance Sense Capable. '1' indicates this pin complex can perform analog sensing on the attached device to determine its type.

8.1.11. Parameter – Amplifier Capabilities (Verb ID=F00h, Input Amplifier Parameter ID=0Dh)

Parameters in this node provide audio function group default information. Individual converters have their own parameters to provide amplifier capabilities if the 'AMP Param Override' bit is set.

Table 28. Parameter – Amplifier Capabilities (Verb ID=F00h, Input Amp Parameter ID=0Dh)

Codec Response Format

Bit	Description
31	(Input) Mute Capable.
30:23	Reserved. Read as 0.
22:16	Step Size. Indicates the size of each step in the gain range. Permanently set to '3' (indicates a step of 1dB).
15	Reserved. Read as 0.
14:8	Number of Steps. Indicates the number of steps in the gain range. '0' means the gain is fixed.
7	Reserved. Read as 0.
6:0	Offset. Indicates which step is 0dB.

8.1.12. Parameter – Amplifier Capabilities (Verb ID=F00h, Output Amplifier Parameter ID=12h)

Parameters in this node provide audio function group default information. Individual converters have their own parameters to provide amplifier capabilities if the 'AMP Param Override' bit is set.

Codec Response Format

Bit	Description
31	(Output) Mute Capable.
30:23	Reserved. Read as 0.
22:16	Step Size. Indicates the size of each step in the gain range. Permanently set to '3' (indicates a step of 1dB).
15	Reserved. Read as 0.
14:8	Number of Steps. Indicates the number of steps in the gain range. '0' means the gain is fixed.
7	Reserved. Read as 0.
6:0	Offset. Indicates which step is 0dB.

8.1.13. Parameter – Connect List Length (Verb ID=F00h, Parameter ID=0Eh)

Parameters in this node provide audio function widget connection information.

Table 30. Parameter – Connect List Length (Verb ID=F00h, Parameter ID=0Eh)

Codec Response Format

Bit	Description
31:8	Reserved. Read as 0.
7	Short Form. 0: Short Form 1: Long Form
6:0	Connect List Length. Indicates the number of inputs connected to a widget. If the Connect List Length is 1, there is only one input, and there is no Connection Select Control (Not a MUX widget).

8.1.14. Parameter – Supported Power States (Verb ID=F00h, Parameter ID=0Fh)

'EnableUnsol' in Command Bit[7:0] for NID=01h (GPIO), 06h (S/PDIF-IN), 0Fh, 10h, 12h~15h (Pin), 1Bh (Vol Knob)

Bit	Description
31:8	Reserved. Read as 0's.
7	Enable Unsolicited Response. 0: Disable 1: Enable
6	Reserved. Read as 0's.
5:0	Tag for Unsolicited Response. Tag [5:0] is defined by software to assign a 6-bit tag for nodes that are enabled to generate unsolicited responses. A node enabled to generate unsolicited responses must return the assigned tag in the top six bits of every unsolicited response. According to the returned tag, software can identify which node generated the unsolicited response.

8.21. Verb – Get Pin Sense (Verb ID=F09h)

Returns the Presence Detect status and the impedance of a device attached to the pin.
