

HIGH PERFORMANCE CURRENT MODE CONTROLLER

The KIA3842BP/BF is high performance fixed frequency current mode controller.

This is specifically designed for Off-Line and DC to DC converter applications offering the designer a cost effective solution with minimal external components. This integrated circuit feature a trimmed oscillator for precise duty cycle control, a temperature compensated reference, high gain error amplifier, current sensing comparator, and a high current totempole output ideally suited for driving a power MOSFET.

Also included are protective features consisting of input and reference undervoltage lockouts each with hysteresis, cycle-by-cycle current limiting, programmable output deadtime, and a latch for single pulse metering.

These devices are available in 8pin dual-in-line plastic packages as well as the 14pin plastic, surface mount (FLP-14).

The FLP-14 package has separate power and ground pins for the totempole output stage.

The KIA3842BP/BF has UVLO thresholds of 16V(on) and 10V(off), ideally suited for off-line converters.

FEATURES

- Trimmed Oscillator Discharge Current for Precise Duty Cycle Control.
- Current Mode Operation to 500kHz.
- Automatic Feed Forward Compensation.
- Latching PWM for Cycle-By-Cycle Current Limiting.
- Internally Trimmed Reference with Undervoltage Lockout.
- High Current TotemPole Output.
- Undervoltage Lockout with Hysteresis.
- Low Start-up and Operating Current.

PIN FUNCTION DESCRIPTION

PIN NO.		FUNCTION	DESCRIPTION
8-PIN	14-PIN		
1	1	Compensation	This pin is the Error Amplifier output and is made available for loop compensation.
2	3	Voltage Feedback	This is the inverting input of the Error amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	5	Current Sense	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	7	R_T/C_T	The Oscillator frequency and maximum Output duty Cycle are programmed by connecting resistor R_T to V_{ref} and capacitor C_T to ground. Operation to 500kHz is possible.
5	-	GND	This pin is the combined control circuitry and power ground (8-pin package only).
6	10	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1.0A are sourced and sunk by this pin.
7	12	V_{CC}	This pin is the positive supply of the control IC.
8	14	V_{ref}	This is the reference output. It provides charging current for capacitor C_T through resistor R_T .
-	8	Power Ground	This pin is a separate power ground return (14pin package only) that is connected back to the power source. It is used to reduce the effects of switching transient noise on the control circuitry.
-	11	V_C	The output high state(V_{OH}) is set by the voltage applied to this pin (14pin package only). With a separate power source connection, It can reduce the effects of switching transient noise on the control circuitry.
-	9	GND	This pin is the control circuitry ground return (14pin package only) and is connected back to the power source ground.
-	2, 4, 6, 13	NC	No connection(14pin package only). These pins are not internally connected.
