**6/4-channel Read/Write Amplifier for GMR-Ind Head Hard Disk Drive****For the availability of this product, please contact the sales office.****Description**

The CXA3238TN/CXA3239TN is a Read/Write amplifier for GMR-Ind (Giant Magneto Resistive-Inductive) heads used in hard disk drives, and is capable of supporting up to six channels.

**Features**

- +5 V and -3 V power supply.
- Current bias voltage sense type.
- Drives up to six heads (CXA3238TN)
- Drives up to four heads (CXA3239TN)
- Low power 180 mW at Read
- Differential read amplifier gain ;  $\times 140/190$   
 $(R_{MR}=50 \Omega)$
- Input noise of  $0.77 \text{ nV}/\sqrt{\text{Hz}}$  (typ.),  
 $R_{MR}=50 \Omega, I_B=6.0 \text{ mA}$ .
- Recovery time write to read ; 300 nsec. (typ.)
- Write data is triggered by differential P-ECL signal.
- Servo bank write. (All channels)
- Write unsafe detection circuit.
- Serial port ...
  - Head selection
  - MR bias
  - Write current

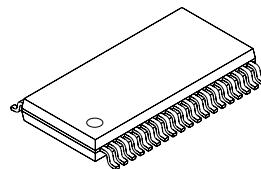

**Applications**

Hard disk drives with GMR-Ind heads.

**Structure**

Bipolar silicon monolithic IC

38 pin TSSOP (Plastic)

**Absolute Maximum Ratings (Ta=25 °C)**

• Supply voltage	V <sub>CC</sub>	-0.3 to +6	V
• Supply voltage	V <sub>EE</sub>	-4.5 to +0.3	V
• Digital input voltage	V <sub>DI</sub>	-0.3 to V <sub>CC</sub> +0.3	V
• Operating temperature	T <sub>OPR</sub>	-20 to +70	°C
• Storage temperature	T <sub>STG</sub>	-55 to +150	°C
• Allowable power dissipation	TSSOP38	P <sub>D</sub>	1000 mW

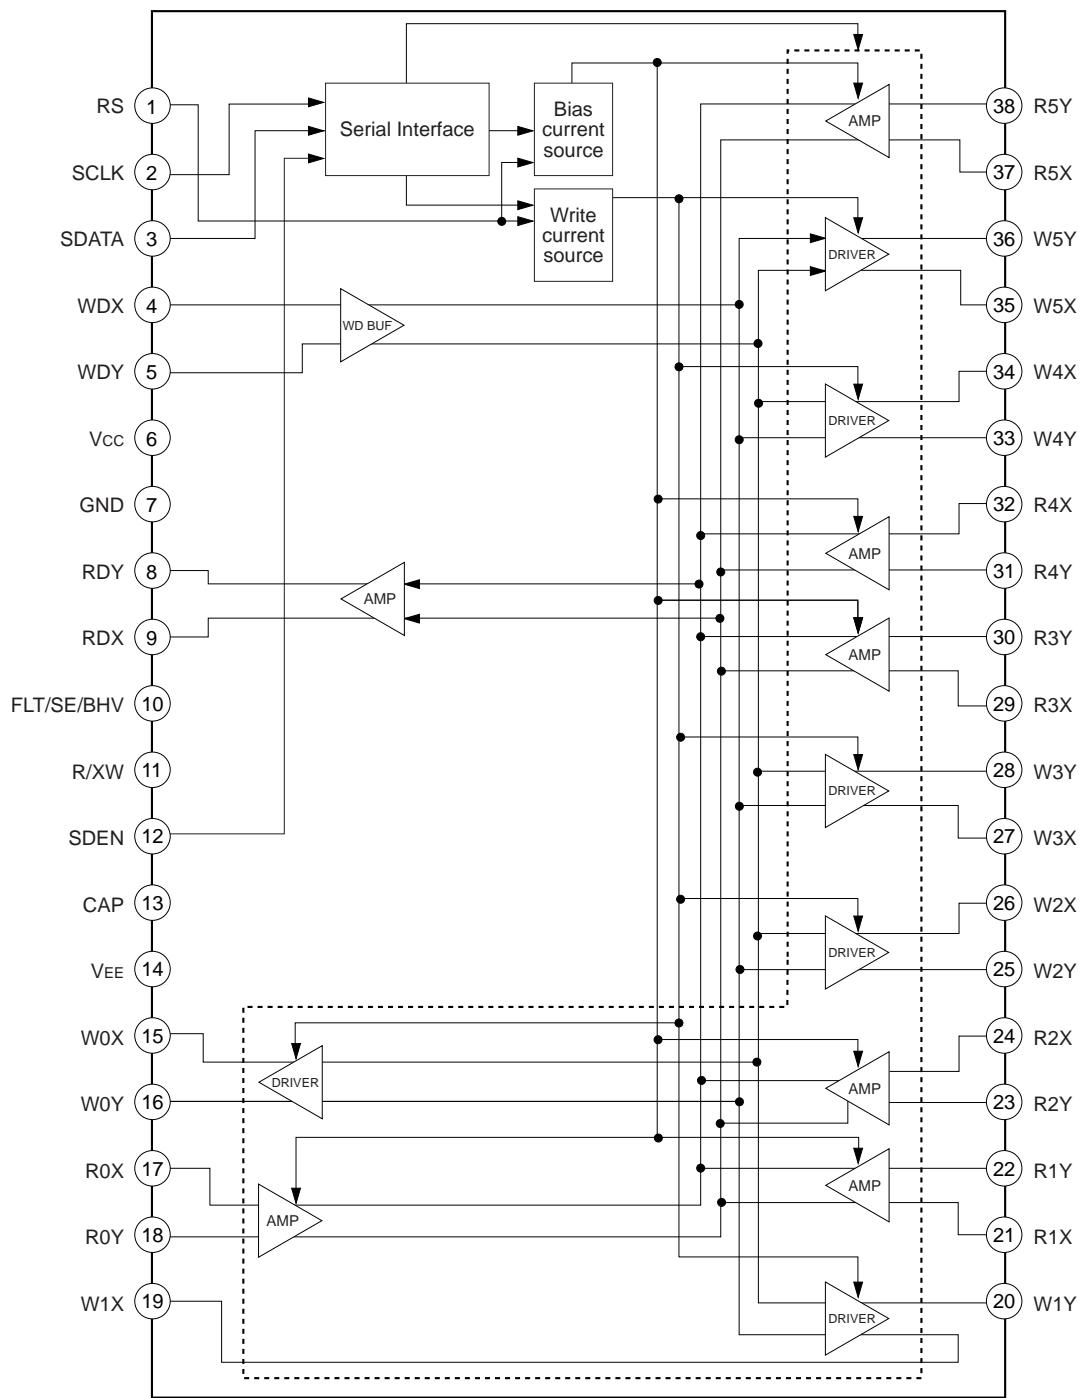

**Operating Conditions**

• Supply voltage	V <sub>CC</sub>	+4.4 to +5.5	V
	V <sub>EE</sub>	-4.0 to -2.6	V
• MR bias voltage	V <sub>MR</sub>	-300 to +300	mV
• Bias current	I <sub>B</sub>	3 to 8	mA
• Write current	I <sub>W</sub>	15 to 45	mA

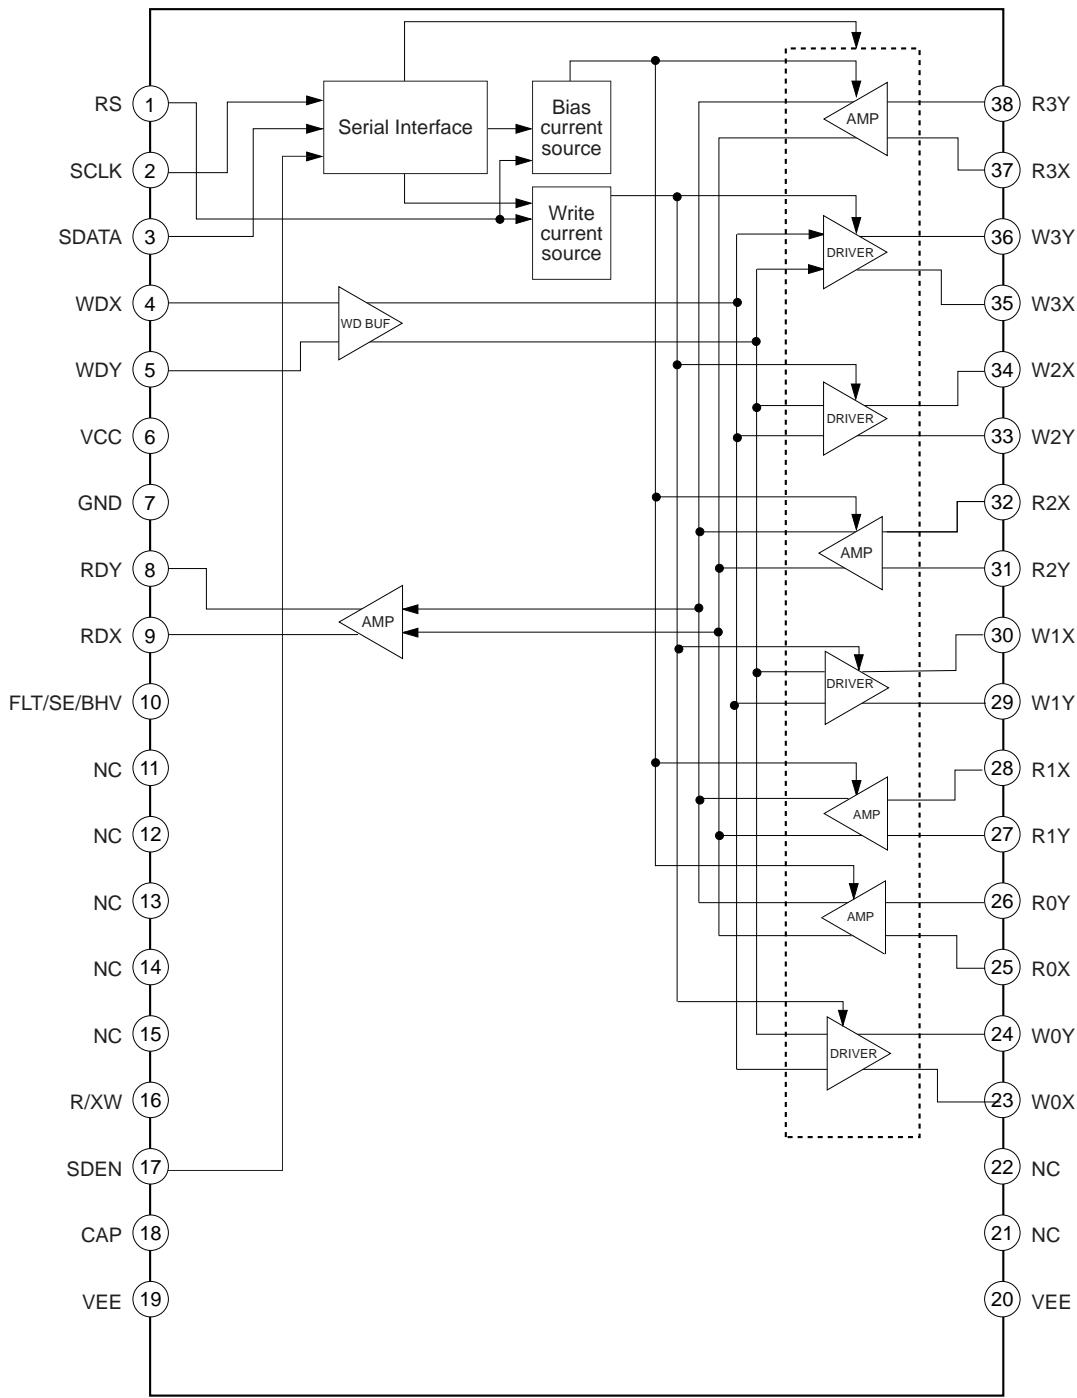

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

## Block Diagram and Pin Configuration

CXA3238TN

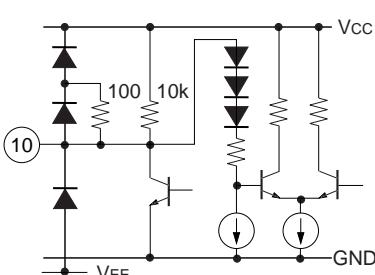

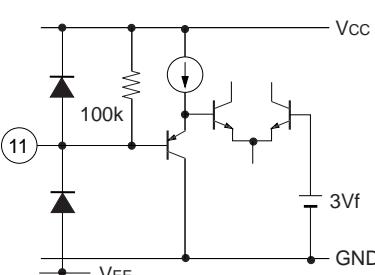

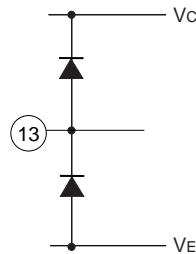

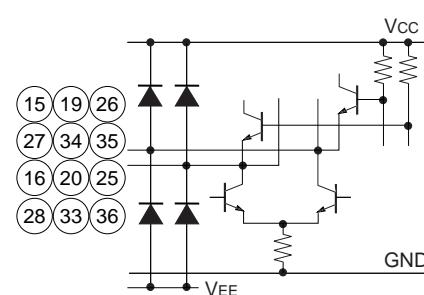

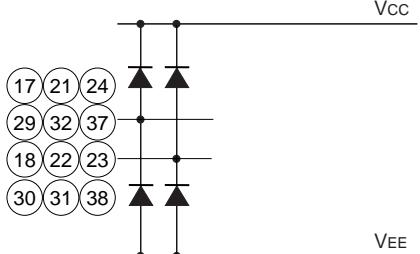

## CXA3239TN

## Pin Description CXA3238TN

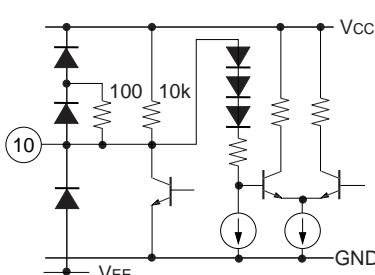

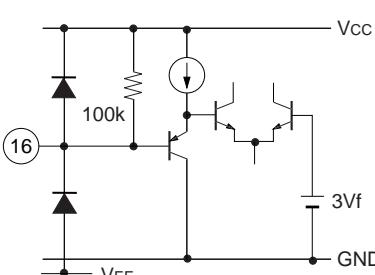

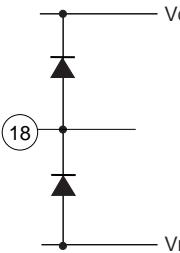

Pin No.	Symbol	Equivalent circuit	Description
1	RS		Bias current setting resister is connected between this pin and GND.
2 3 12	SCLK SDATA SDEN		Serial control signal input.
4 5	wdx wdy		Differential P-ECL write data input.
6	Vcc		5 V power supply.
7	GND		Ground
8 9	RDX RDY		Read amplifier output with coupling capacitors. High impedance in the write mode.

Pin No.	Symbol	Equivalent circuit	Description
10	FLT/SE/BHV		Head unsafe detection output. Servo Bank Write Enable input. Buffered Head Voltage output.
11	R/XW		Read / Write control signal input. Read when high, Write when low.
13	CAP		Connect an external capacitor of Read amplifier between this pin and VEE.
14	V <sub>EE</sub>		-3 V power supply.
15 16 19 20 26 25 27 28 34 33 35 36	W0X W0Y W1X W1Y W2X W2Y W3X W3Y W4X W4Y W5X W5Y		Inductive heads for Write. Six channels are provided.

Pin No.	Symbol	Equivalent circuit	Description
17	R0X		
18	R0Y		
21	R1X		
22	R1Y		
24	R2X		
23	R2Y		
29	R3X		
30	R3Y		
32	R4X		
31	R4Y		
37	R5X		
38	R5Y		MR heads for Read. Six channels are provided.

## Pin Description CXA3239TN

**Serial port characteristics**

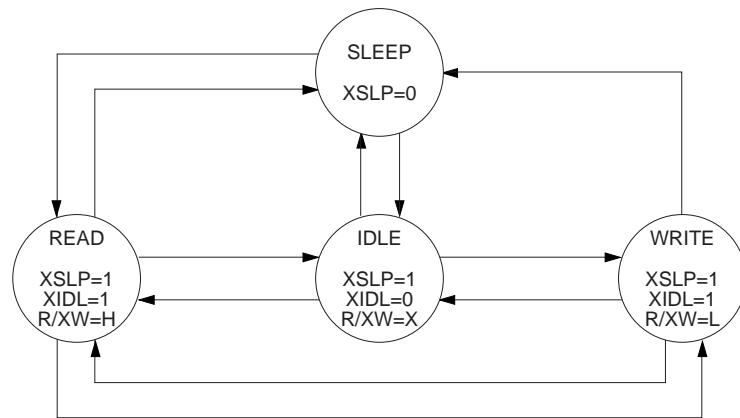

ADR1	ADR0	DATA5	DATA4	DATA3	DATA2	DATA1	DATA0
0	0	XSLP	XIDL	N/A	HS2	HS1	HS0
0	1	GAIN	BHV	N/A	IB2	IB1	IB0
1	0	MROPN	MRSHT	IW3	IW2	IW1	IW0

\*IB<2-0> bits are initialized by '0' at power on

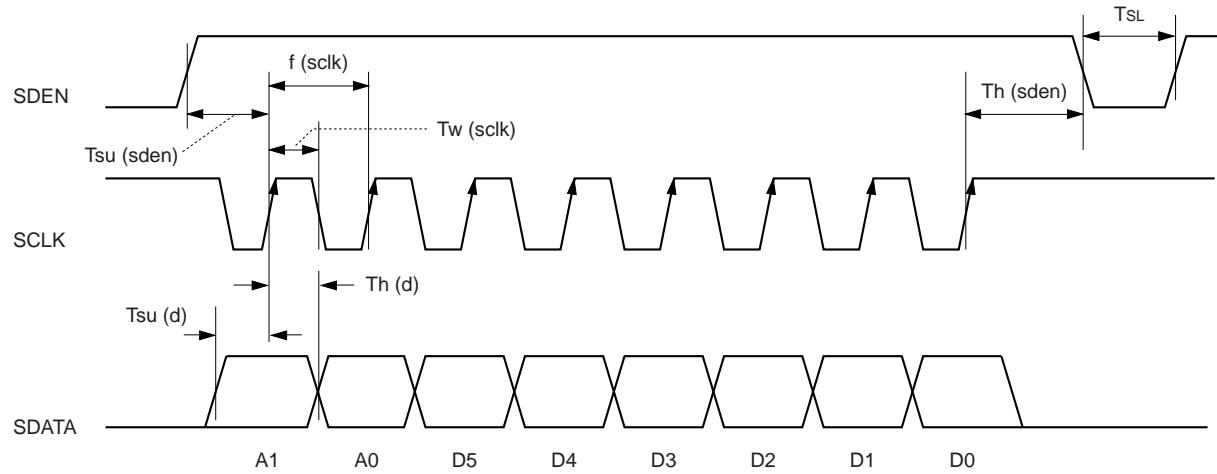

**Code Description**

Bit	Function
XSLP	"0" = Set the pre-amp into low power "sleep" mode
XIDL	"0" = Set preamplifier to idle mode
HS<2-0>	Head select bit
GAIN	Set the pre-amp to high or low gain mode. "1" = Set preamplifier to high gain mode
BHV	Activate the BHV test point pin. "1" active.
IB<2-0>	MR bias current set
MROPN	"1" = Set MR head open detector active.
MRSHT	"1" = Set MR head short detector active.
IW<3-0>	Set write current

## Mode Control

## Serial Port Timing Detail

## Serial Port Timing

After the SDEN goes high, the last eight bits are transferred into the register. The SCLK will shift the data presented at the SDATA into an internal shift register on the rising edge of each clock.

As SCLK initial condition, both of Low and High signal is acceptable.

◆ Unsafe condition

1. Write fault condition

FLT is a high level in write fault condition.

- Open write head leads.  $f_{WD} < 15 \text{ MHz}$
- Write head leads shorted to ground.
- WD frequency is too low.
- Power supply is out of tolerance.

2. Read fault condition

FLT is a low level in read fault condition.

- Open and short MR head. (This function is set by serial register)

◆ Bank write control (refer to 'Bank write current vs Current accuracy' characteristic curve)

1. Set the Read mode.

2. Force a certain voltage(min.Vcc+1.2V) to FLT/SE pin by using the pull-up resistor( $R_{se}=820\Omega$ )

#This operation disables all Fault detection.

3. Set Vcc at 3.5 V (in case of Erase mode only)

4. Start the write operation by setting R/XW = "L".

5. Terminate the write operation by setting R/XW = "H".

i) Allow 50 % write duty or less.

ii) Low voltage detector is disabled in Bank Write mode and Erase mode.

iii) Don't change the serial register data bits in following conditions :

\*) Vcc=3.5 V

\*\*) On entering Write data

◆ BHV (Buffered Head Voltage)

1. Applicable within  $V_{cc}=5 \text{ V}\pm 5 \text{ \%}$

2. Turn BHV on, but turn off MROPN and MRSHT

3.  $V_{BHV}$  is determined by basis of  $V_{cc}$ .  $V_{BHV} = V_{cc} - 4 \times I_B \times (R_{MR} + 5.5 \Omega)$

◆ Head select table

6ch

HS2	HS1	HS0	Head select, Normal operation

1	0	1	1	37
1	1	0	0	39
1	1	0	1	41
1	1	1	0	43
1	1	1	1	45

(\*1) Actual head current is defined by the following equation:

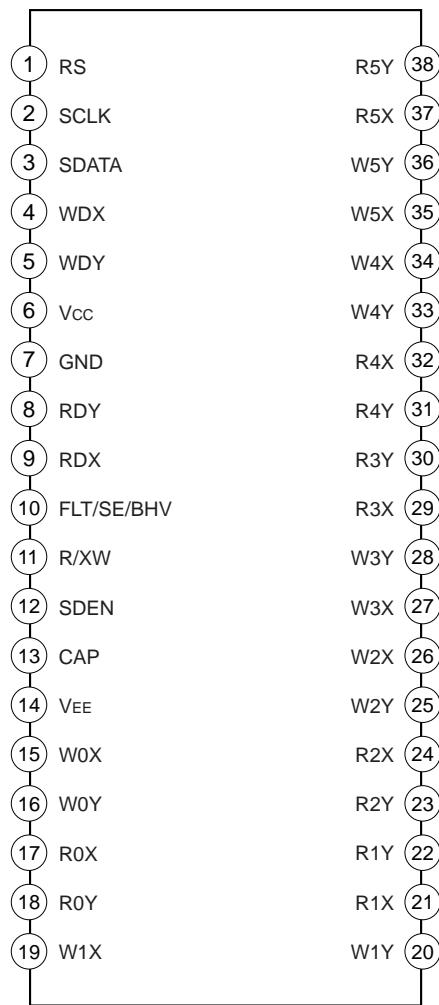

$$I_{head} = I_w / (I + R_h/R_d)$$

R<sub>h</sub> : Head Resistance

R<sub>d</sub> : Damping Resistance

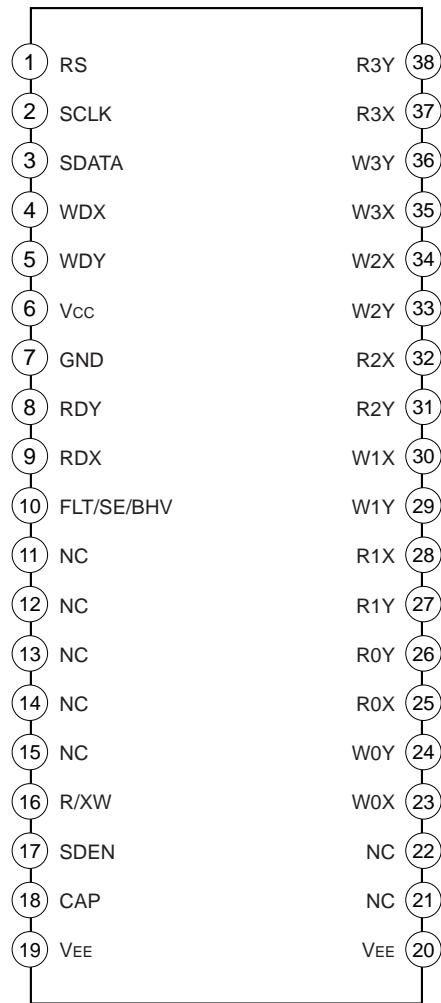

(\*2) Short X-Y terminal on un-used head
