

**M51594AFP****OPTICAL PICKUP SERVO CONTROL****DESCRIPTION**

The M51594AFP is a semiconductor integrated circuit with built-in logic control, servo amp, and switches necessary to perform servo control of CD player optical pickups.

**FEATURES**

- Combination with preamplifier for optical pickup (M51595FP, M51567P, M51599FP, or M51598FP) makes it possible to form a pickup servo control system
- Single chip containing amp, switches, and logic controller necessary for servo control of optical pickup
- Built-in focus search circuit for automatic search up and down
- Built-in serial-to-parallel data converter to reduce microcomputer overload
- Adapts for any pickup by changing gain and frequency response of amplifiers with external components
- Built-in Vcc/2 generator to be capable of being driven by either dual or single power supply

Outline 42P2R-A

0.8mm pitch 450mil SSOP  
(8.4mm × 17.5mm × 2.0mm)

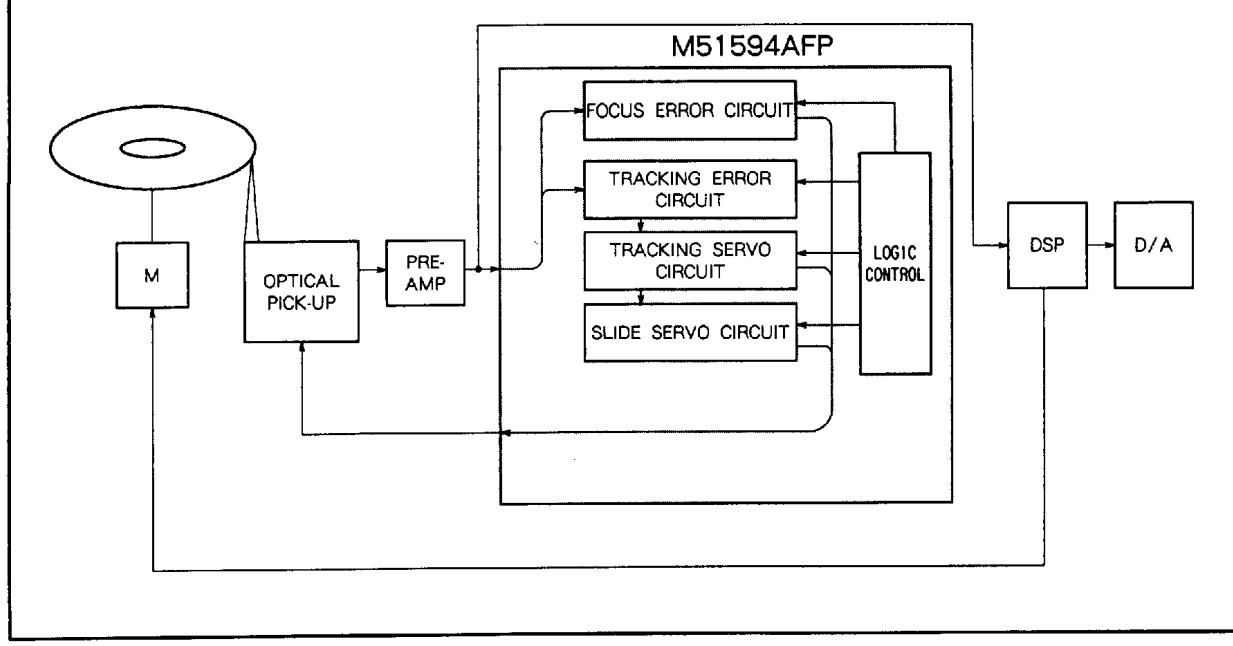

**RECOMMENDED OPERATING CONDITIONS**

Supply voltage range ..... Vcc, VEE =  $\pm 4.75 \sim \pm 5.25V$   
or Vcc = 4.75~5.25V

Rated supply voltage

..... Vcc, VEE =  $\pm 5V$  (Split supply voltage)  
or Vcc = 5V (Single supply voltage)

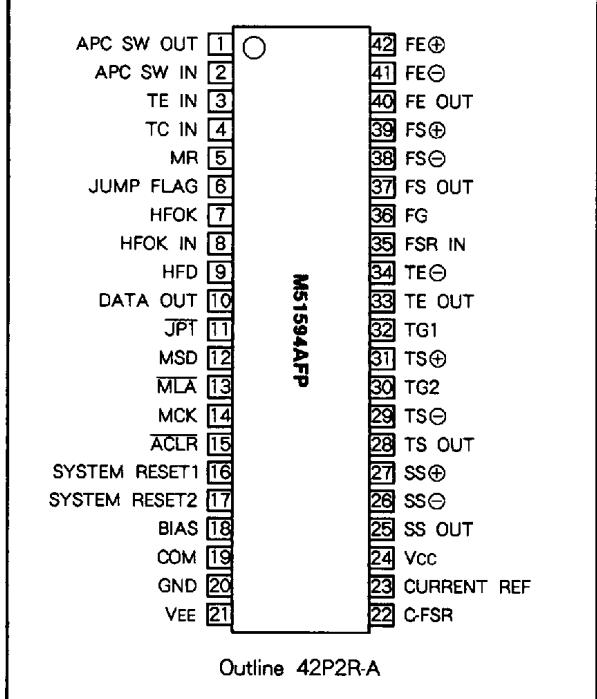

Rated power dissipation ..... 70mW

**SYSTEM CONFIGURATION**

Note 1. Supply voltage turn on and pin ⑯  $\overline{ACLR}$  input reset pulse and next all parameter measures.

## M51594AFP

## OPTICAL PICKUP SERVO CONTROL

**M51594AFP LOGIC CONTROL FUNCTION DESCRIPTION****1. Serial command function**

The M51594AFP has a 8-bit shift register in the logic control block to convert serial data from microcomputer input through MSD pin ⑫, to internal switch commands.

**(1) Data-Input function**

Higher 4 bits of the 8-bit data (D7~D4) are used to select the command mode. Lower 4 bits (D3~D0) set the command state.

Once a command is set, it is held until a new command of the same command mode is input. If an other command mode is selected the command state will not change.

**Table 1. Serial command function**

X = 1 or 0

| Mode Name         | MSB         |    |        |    | Data          | IN pin ⑫ Input | Data Out pin ⑩ Output |     |

Note 2. TRACK1 A and TRACK1 B at the same command mode.

TG2 and TG1 are set by both commands. BRAKE A or B are determined by selecting TRACK1 A or TRACK1 B.

3. Data out (pin ⑩ output) is changed automatically when the command mode is selected.

4. The serial command 10XXXXXX is available of control M50422P/M50423FP/M50427FP (DSP LSI).

When this command input, the command state of M51594FP is not changed

**Table 2. Command function**

| Command | Command mode | Data |           | Function  |  |  |  |
|---------|--------------|------|-----------|---|--|--|--|
| FS ON   | FOCUS        | D3   | 1 ON      | Focus search start → Focus on                     |  |  |  |

| -       | SERVO OFF    |      |           | Data of D0~D3 is reset to 0                       |  |  |  |
|         |              |      |           | Data of D0~D3 is reset to 0                       |  |  |  |

## OPTICAL PICKUP SERVO CONTROL

## SETTING CURRENT VALUE OF INTERNAL CURRENT SOURCES

[Focus search (FSR), Tracking servo (TS), Slide motor servo (SS)]

Current value of internal current sources (FSR, TS, SS) is set by an external resistor connected between pin ② and Vcc. (Resistance value : Rx)

If the current value of a current source (FSR, TS, SS) is  $I_{FSR}$ ,  $I_{TS}$ ,  $I_{SS}$

$$I_{FSR} \approx \frac{1}{8} \cdot \frac{V_{CC} - V_{②}}{Rx}$$

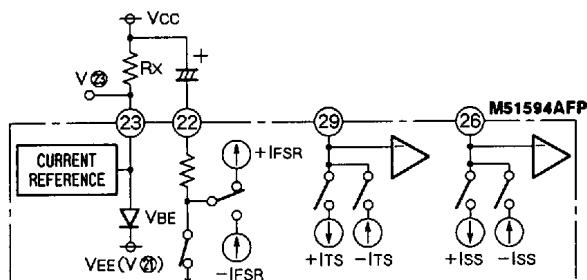

$$I_{TS} \approx \frac{1}{8} \cdot \frac{V_{CC} - V_{②}}{Rx}$$

$$I_{SS} \approx \frac{1}{4} \cdot \frac{V_{CC} - V_{②}}{Rx}$$

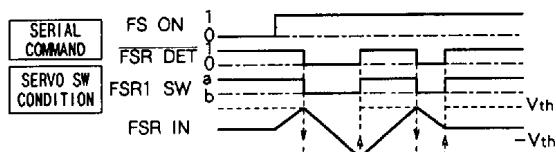

And if the voltage value of pin ② is  $V_{②}$ , the voltage value of pin ②,

$$V_{②} = V_{BE} + V_{BE} \quad (V_{BE} \approx 0.7V)$$

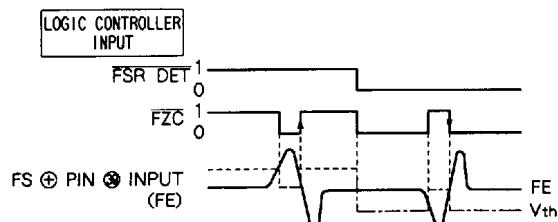

## BLOCK DIAGRAM OF CURRENT SOURCES

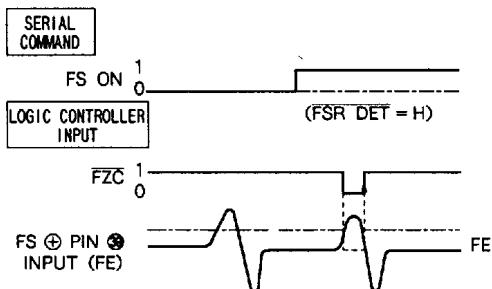

## Timing chart of FSR det

## Timing chart of FZC

## FZC reset

## FSR detector

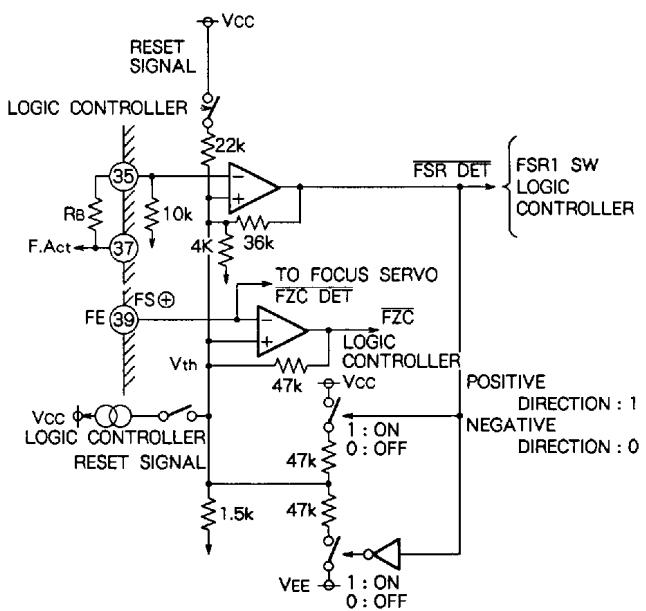

With external resistor ( $R_B$ ) connected between FS OUT (pin ⑦ output) and FSR IN (pin ④ input) at FSR function,

- 1) FSR direction.
- 2) Threshold voltage polarity of FZC detector are automatically changed.

Focus search always starts from positive voltage side. The direction of FSR is changed by FSR 1 SW controlled by FSR DET signal.

| INPUT             | OUTPUT                |                               |                   |
|-------------------|-----------------------|-------------------------------|-------------------|
|                   | FSR IN level $V_{IN}$ | FSR DET                       | FSR1 SW           |
| $V_{IN} > V_{th}$ | 0                     | b : Negative direction of FSR | Min -0.30V Max 0V |
| $V_{IN} < V_{th}$ | 1                     | a : Positive direction of FSR | 0V 0.30V          |

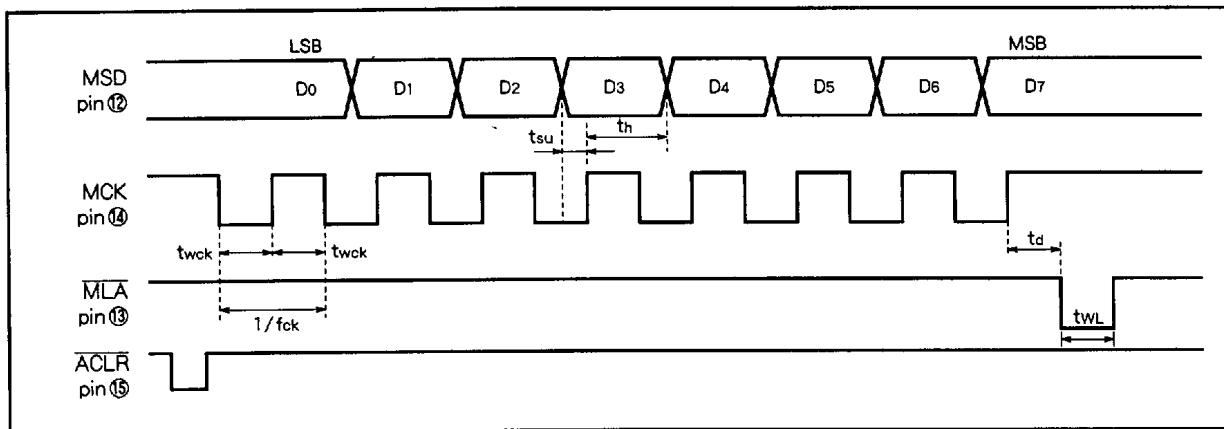

## Equivalent circuit

## OPTICAL PICKUP SERVO CONTROL

## (2) How to send serial data(MSD)

The serial command is executed by sending MLA signal after sending LSB serial data.

**Fig. 1 Serial data input timing chart**

## 2. BRAKE A, BRAKE B

When BRAKE A command or BRAKE B command is set to High (1), Jump brake operates.

This increases the ability to break after track jump

### Jump brake action

- 1) When MR (pin ⑤ input) = 1, Track servo loop goes off at the edge of pulse output from TC Det.
- 2) When MR (pin ⑤ input) = 0, Track servo loop goes on at the edge of pulse output from TC Det.

**Table 3. SW states at jump brake**

| INPUT    | OUTPUT                                    |   |
|----------|---|---|
| MR<br>TC | BRAKE A = 1<br>TS2 SW states              | BRAKE B = 1<br>TS1 SW states              |
| 1<br>0   | a (TRACK servo OFF)<br>b (TRACK servo ON) | b (TRACK servo OFF)<br>a (TRACK servo ON) |

## 3. TRACK, SLIDE

**Table 4. Track function**

| Command | Data<br>D <sub>3</sub> D <sub>2</sub> | OUTPUT (SW state) |               |           |           |  |
|---------|---------------------------------------|-------------------|---------------|-----------|-----------|--|
|         |                                       | TS1 SW            | TS2 SW        | JF SW     | JR SW     |  |
| TS OFF  | 0 0                                   | a (servo ON)      | a (servo OFF) | b         | b         |  |
| TS ON   | 0 1                                   | a (servo ON)      | b (servo ON)  | b         | b         |  |
| JF      | 1 0                                   | b (servo OFF)     | b (servo ON)  | a (JF ON) | b         |  |
| JR      | 1 1                                   | b (servo OFF)     | b (servo ON)  | b         | a (JR ON) |  |

## OPTICAL PICKUP SERVO CONTROL

**Table 5. Slide function**

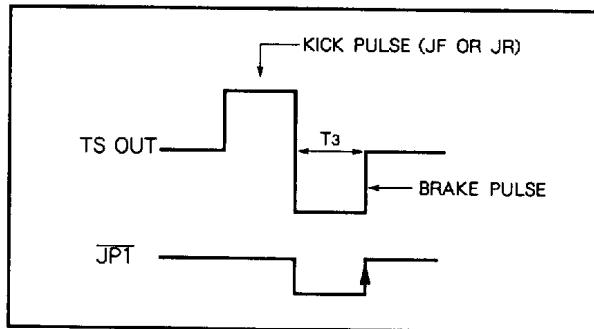

| Command | INPUT |    | OUTPUT (SW state) |           |           |
|---------|-------|----|-------------------|-----------|-----------|
|         | D1    | D0 | SS SW             | SF SW     | SR SW     |
| SS OFF  | 0     | 0  | a (servo OFF)     | b         | b         |
| SS ON   | 0     | 1  | b (servo ON)      | b         | b         |
| SF      | 1     | 0  | a (servo OFF)     | a (SF ON) | b         |
| SR      | 1     | 1  | a (servo OFF)     | b         | a (SR ON) |

**4. Direct command function****JPT Input**

At one track jump, JPT signal allows two transmissions of serial data to selected and restrains the delay time of microcomputer.

JPT is usually high. After microcomputer catches the up signal of data out output (TC signal), if JPT goes down, the polarity of jump direction is automatically. (JF → JR, JR → JF)

After one track jump is finished (after period T3), if JPT goes up, Jump ends and the states become TS ON and SS ON.

**Fig. 2 JP1 timing chart****Table 6. TRACK, SLIDE states by JP1 Input**

| JP1<br>(INPUT) | TRACK2 Mode (0010 D3 D2 D1 D0) (OUTPUT) |       |       |       |               |       |    |    |
|----------------|---|-------|-------|-------|---------------|-------|----|----|
|                | TRACK (D3 D2)                           |       |       |       | SLIDE (D1 D0) |       |    |    |
|                | 00                                      | 01    | 10    | 11    | 00            | 01    | 10 | 11 |
| 1              | TS OFF                                  | TS ON | JF    | JR    | SS OFF        | SS ON | SF | SR |
| 0              | TS OFF                                  | TS ON | JR    | JF    | SS OFF        | SS ON | SF | SR |
| ↑              | TS OFF                                  | TS ON | TS ON | TS ON | SS ON         | SS ON | SF | SR |

Note 5. When command mode is TS OFF (00100XX, MSB first), even if JPT goes up, states do not become TS ON and SS ON.

6. Change to TS ON and SS ON after JPT goes up are held.

**5. Logic output function****(1) Data out**

Data out output mode changes at each serial command mode.(shown in Table 1) It is decided by the last sent serial command.

**Table 7. Data out output function**

|      | Data Out output name | Serial Command Mode(INPUT) |
|------|----------------------|----------------------------|
| (I)  | FS OK                | FOCUS (0000XXXX)           |
| (II) | TC                   | TRACK2 (0010XXXX)          |

## (I) FS OK

When HF OK (pin ⑦ input) was high and FS SW was closed (servo ON), FS OK is high.

**Table 8. FS OK truth**

| HF OK | INPUT         |  | OUTPUT<br>FS OK |
|-------|---------------|--|-----------------|
|       | FS SW         |  |                 |
| 0     | b (servo OFF) |  | 0               |
| 1     | b (servo OFF) |  | 0               |
| 0     | a (servo ON)  |  | 0               |
| 1     | a (servo ON)  |  | 1               |

Note 7. While FS OK is low, TS2 SW and SS SW are opened regardless of the serial command.

**Table 9. TC output**

| INPUT    | OUTPUT |
|----------|--------|
| MR       | TC     |
| 1 ↑ or ↓ | 1      |
| 0 ↑ or ↓ | 0      |

## OPTICAL PICKUP SERVO CONTROL

(2) **HFD (HF defect)**

Output is High when HF OK is Low.

(3) **Jump flag**

Jump flag terminal outputs ; High when serial command is TS OFF or JF or JR or BRAKE. Outputs is low at other times.

**6. Focus error amp**

This amp is auxiliary.

**7. APC switch**

The APC circuit supply is controlled by this switch.

**8. System reset**

This circuit generates the reset pulse at power-on.

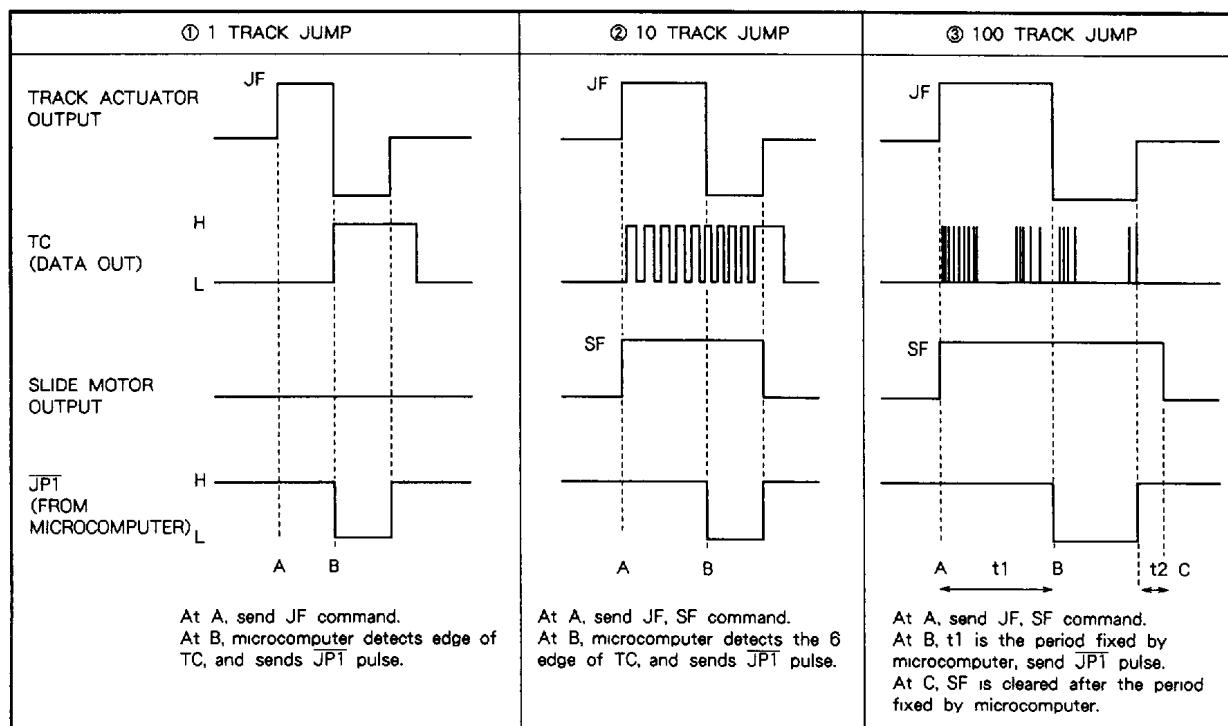

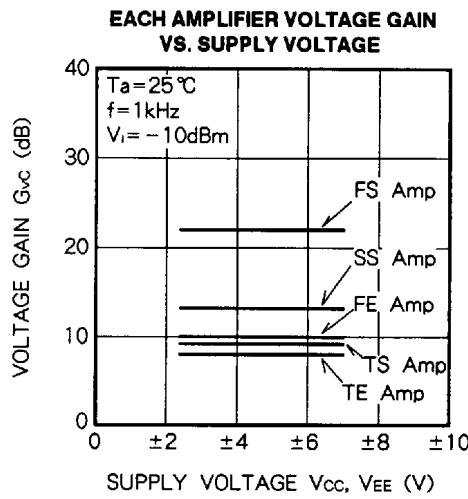

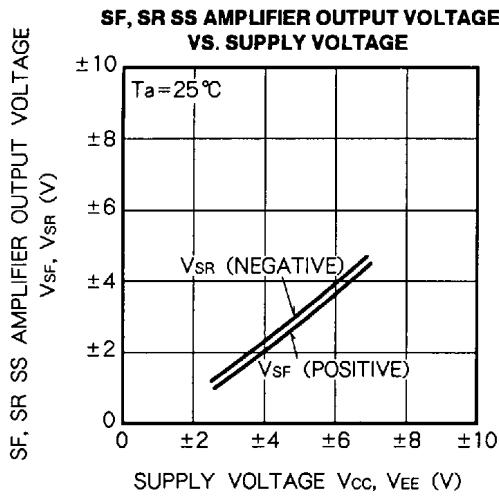

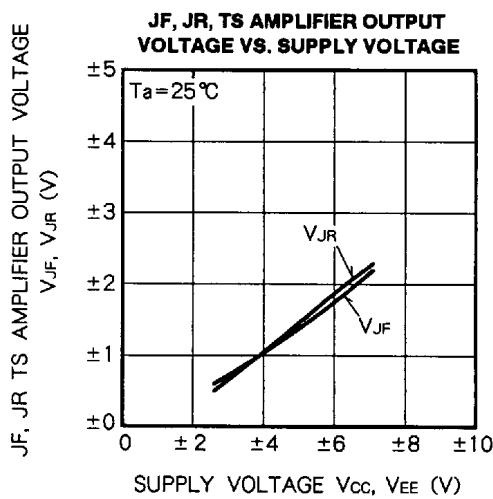

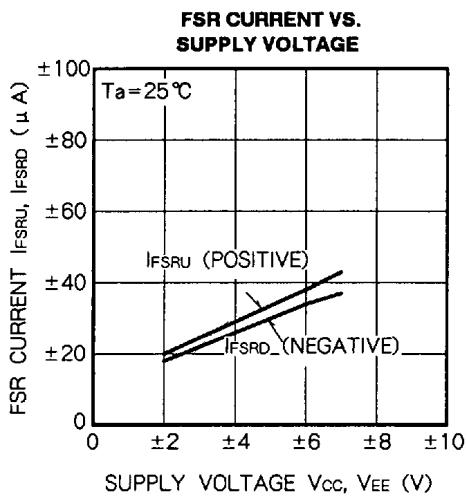

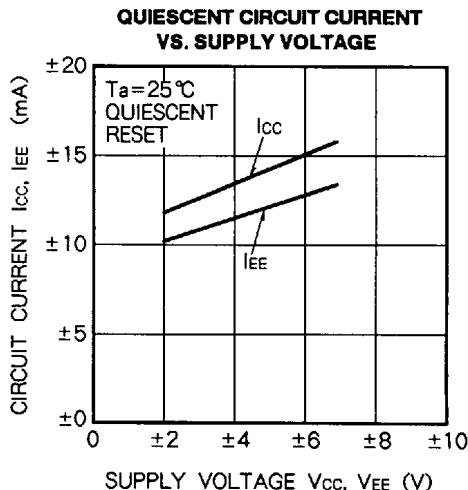

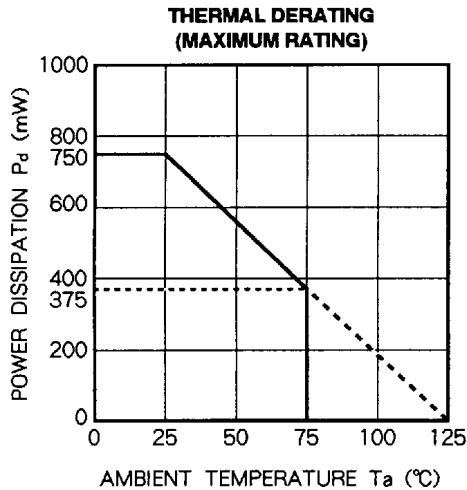

Fig. 3 Example for track jump timing. (Forward jump)
