

## Features

- Operating voltage: 2V~12V
- Low power consumption
- Built-in oscillator needs only 5% resistor
- 0/2/4/8 data selectable
- 2<sup>24</sup> maximum address and data codes
- Easy interface with an RF or IR medium
- One time programmable process
- Data active: D0~D7
- Minimal external components
- HT6P20A/B: 8-pin DIP/SOP package
- HT6P20D: 16-pin DIP/NSOP package

## Applications

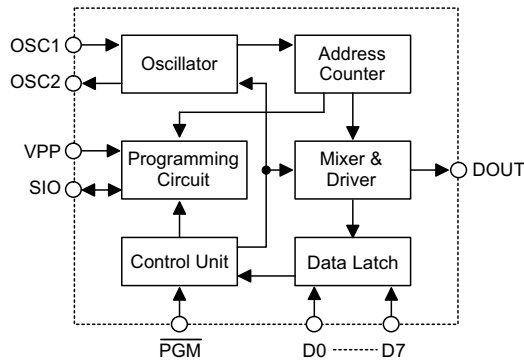

- Burglar alarm system
- Smoke and fire alarm system
- Garage door controllers
- Car door controllers
- Security system
- Cordless telephones
- Other remote control systems

## General Description

The HT6P20X is a CMOS LSI encoder designed for remote control system applications. It encodes 24 bits of information and then serially transmits it via the DOUT pin upon receipt of transmission enable (DATA pins: D0~D7) signals. The combination of address and data bits of the HT6P20X is designed using one time pro-

grammable process. In addition, the chip offers various packaging for flexible combination of programmable address/data so as to meet various applications. Its programmable address/data is transmitted together with the anti-code bits via RF or infrared transmission medium upon receipt of a trigger signal.

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

**Functional Description**
**Normal Operation**

The HT6P20X encodes and transmits address/data to a decoder upon receipt of a trigger signal. The address codes of the HT6P20A are always transmitted as long as power ( $V_{DD}$ ) is supplied. The transmission function of the HT6P20B/D is enabled by the D0~D7 pins (active low). The following is the transmission timing of the HT6P20X:

A complete code word of the HT6P20D consists of 3 periods as shown below.

The HT6P20A/B/D detects the logic state of the internal programmed address and the external data pins, and then transmits the detected information during the code period. Each address/data bit can be set to one of the following two logic states:

**Application Circuits**

Note: In order to prevent the IC from getting damaged due to the latch up, the 100Ω resistor or the LED which can also be a transmission indicator is indispensable when V<sub>DD</sub>=9V~12V.
