Standard Inspection

Among electrical characteristics, total quantity will be inspected as below:-

- Distance between emitter and detector
- Current consumption
- H level output voltage
- L level output voltage

Infrared Receiver Module

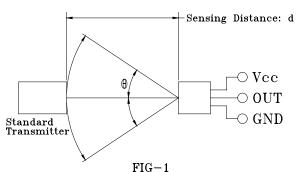

Module No.: PIC-2319SB

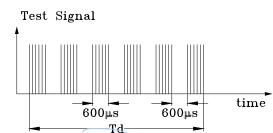

Testing Method

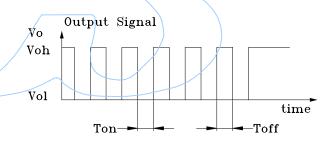

Distance between emitter and detector specifies maximum distance that output waveform satisfies the standard (FIG-3) under the conditions below against the standard transmitter.

- a. Measuring place
 Indoor without extreme reflection of light.
- b. Ambient light source
 Detecting surface illumination is
 200±5Lux under ordinary white
 fluorescence lamp of no high
 frequency lightning.
- c. Standard transmitter

 Transmitter wave indicated in
 FIG-2 of standard transmitter is
 arranged to satisfy Vo≥50mVp-p
 under the measuring circuit
 specified in FIG-3

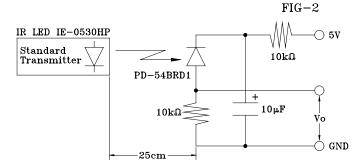

FIG-3 Power Output Measurement Circuit

Precautions for Use

- a. Store and use where there is no force causing transformation or change in quality.
- b. Store and use where there is no corrosive gas or sea (salt) breeze.
- c. Store and use where there is no extreme humidity.
- d. Solder the lead pin within the condition of ratings. After soldering, do not add exterior force.
- e. Do not wash this device. Wipe the stains of diode side with a soft cloth. You can use the solvent, ethyl alcohol, or methyl alcohol only.
- f. To prevent static electricity damage to the pre-amp, make sure that the human body, the soldering iron are connected to ground before using.
