

Rev. V3

#### **Features**

- High Speed CMOS Technology
- Quad Channel
- Positive Voltage Control
- Low Power Dissipation
- Low Cost Plastic SOIC-16 Package
- 100% Matte Tin Plating over Copper
- Halogen-Free "Green" Mold Compound
- 260°C Reflow Compatible
- RoHS\* Compliant Version of SWD-119

## **Description**

The MADRCC0007 is a quad channel driver used to translate TTL control inputs into gate control voltages for GaAs FET microwave switches and attenuators. High speed analog CMOS technology is utilized to achieve low power dissipation at moderate to high speeds, encompassing most microwave switching applications. The output HIGH level is optionally 0 to +2.0V (relative to GND) to optimize the intermodulation products of the control devices at low frequencies.

## **Ordering Information**

| Part Number    | Package         |  |  |
|----------------|-----------------|--|--|
| MADRCC0007 PIN | Bulk Packaging  |  |  |
| MADRCC0007TR   | 1000 piece reel |  |  |

Note: Reference Application Note M513 for reel size information.

#### **Functional Schematic**

### Pin Configuration

| Pin No. | Function | Pin No. | Function  |
|---------|----------|---------|-----------|
| 1       | Vee      | 9       | Output A1 |
| 2       | Vcc      | 10      | Output B1 |
| 3       | C4       | 11      | Output A2 |
| 4       | С3       | 12      | Output B2 |
| 5       | C2       | 13      | Output A3 |
| 6       | C1       | 14      | Output B3 |
| 7       | Vopt     | 15      | Output A4 |
| 8       | Ground   | 16      | Output B4 |

| Icc              | Quiescent Supply Current                     | $V_{CC} = Max$<br>$V_{OPT} = Min \text{ or } Max$ | $V_{EE} = Min$ $V_{IN} = V_{CC} \text{ or GND}$ | μΑ    | _                     | 250  | 400                  |
| ΔI <sub>CC</sub> | Additional Supply Current, per TTL Input pin | V <sub>CC</sub> = Max                             | $V_{IN} = V_{CC}$ -2.1V                         | mA    | _                     | _    | 1.0                  |

## **Handling Procedures**

Please observe the following precautions to avoid damage:

## **Static Sensitivity**

Silicon Integrated Circuits are sensitive electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

#### **Truth Table**

| Input     | Outputs         |                  |  |  |
|-----------|-----------------|------------------|--|--|
| СХ        | Α               | В                |  |  |
| Logic "0" | V <sub>EE</sub> | V <sub>OPT</sub> |  |  |
| Logic "1" | $V_{OPT}$       | V <sub>EE</sub>  |  |  |

<sup>2.</sup> V<sub>OPT</sub> is grounded for most applications. To improve the intermodulation performance and the 1 dB compression point of GaAs control devices at low frequencies, VOPT can be increased to between 1.0 and 2.0V. The nonlinear characteristics of the GaAs control devices will approximate performance at 500 MHz. It should be noted that the control current that is on the GaAs MMICs will increase when positive controls are applied.
