

# Half-Bridge Driver

#### **Features**

- Floating channel designed for bootstrap operation
- Fully operational to +600V
- Tolerant to negative transient voltage
- dV/dt immune
- Gate drive supply range from 10 to 20V
- Under voltage lockout for both channels
- 3.3V, 5V and 15V input logic compatible
- Cross-conduction prevention logic
- Internally set dead-time (100ns)
- Output in phase with input
- Matched propagation delay for both channels
- Lower di/dt gate driver for better noise immunity

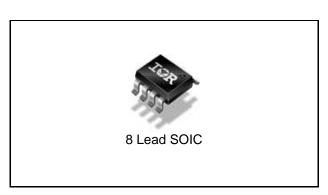

#### **Product Summary**

| Voffset            | 600V max.      |
|--------------------|----------------|
| I <sub>O+/-</sub>  | 60 mA / 130 mA |
| V <sub>О</sub> Т   | 10 – 20V       |
| Delay Matching     | 50ns           |
| Ton/off (typ.)     | 220 & 220 ns   |
| Internal Dead time | 100 ns         |
|                    |                |

#### **Description**

The IR25601 is a high voltage, high speed power MOSFET and IGBT driver with independent high and low side referenced output channels. Proprietary HVIC and latch immune CMOS technologies enable ruggedized monolithic construction. The logic input is compatible with standard CMOS or LSTTL output, down to 3.3V logic. The output driver features a high pulse current buffer stage designed for minimum driver cross-conduction. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high side configuration which operates up to 600 volts.

#### **Package Options**

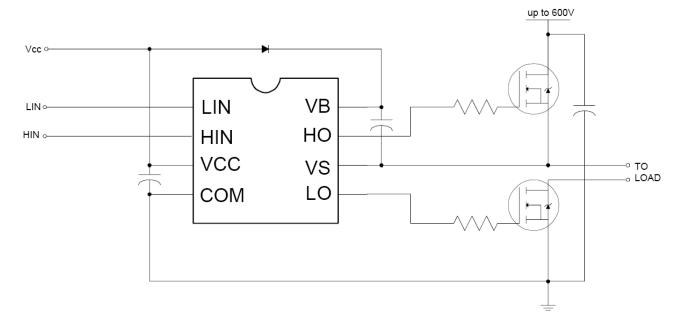

## **Ordering Information**

| Base Bart Number |              | Standar       | d Pack   | Orderable Devi Neumber |

## **Typical Connection Diagram**

#### **Absolute Maximum Ratings**

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to COM. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

| Symbol            | Definition   | Min.                 | Max.                  | Units |
|-------------------|--|----------------------|-----------------------|-------|
| $V_{B}$           | High side floating supply absolute voltage         | -0.3                 | 625                   |       |
| Vs                | High side floating supply offset voltage           | V <sub>B</sub> - 25  | $V_B + 0.3$           |       |
| $V_{HO}$          | High side floating output voltage                  | V <sub>S</sub> - 0.3 | $V_B + 0.3$           | V     |
| $V_{CC}$          | Low side and logic fixed supply voltage            | -0.3                 | 25                    |       |
| $V_{LO}$          | Low side output voltage                            | -0.3                 | $V_{CC} + 0.3$        |       |
| $V_{IN}$          | Logic input voltage (HIN & LIN)                    | -0.3                 | V <sub>CC</sub> + 0.3 |       |

### **Recommended Operating Conditions**

For proper operation the device should be used within the recommended conditions. The  $V_S$  offset rating is tested with all supplies biased at 15V differential.

| Symbol          | Definition                                 | Min.                | Max.                | Units |
