The S-2900A is a wide operating voltage range, low power consumption 512-bit E2PROM. The organization is 64-word × 8-bit, and can be read or written serially. It is easily interfaced with a serial port because the instruction is composed of eight-bit units.

### ■ Features

- Operating voltage
  - Read : 1.5 to 5.5 V
  - Write : 2.7 to 5.5 V
- Power consumption
  - Standby : 1  $\mu$ A max.
  - Read : 1.4 mA max. ( $V_{CC} = 5.5$  V)
  - 0.4 mA max. ( $V_{CC} = 1.5$  V)
- Operating Frequency 2 MHz ( $V_{CC} = 4.5$  V to 5.5 V)
  - 500 kHz ( $V_{CC} = 2.7$  V to 4.5 V)
  - 100 kHz ( $V_{CC} = 1.5$  V to 2.7 V)
- Memory configuration 512 bits (64-word × 8-bit)
- Byte writing/Byte reading
- Data retention: 10 years
- Package : 8-pin DIP/SOP
  - SOT-89-5
  - Bare chip

## ■ Operation

### (1) Read (READ) mode

After changing CS from "L" to "H", this mode inputs the op code and address into DATA, synchronized with the rise of  $\overline{SK}$ . When A0 is input at the rise of the eighth  $\overline{SK}$  clock cycle, eight-bit data in the specified address is output from the DATA pin, synchronized with the falling of  $\overline{SK}$ .

The DATA pin changes to high impedance after CS changes to "L".

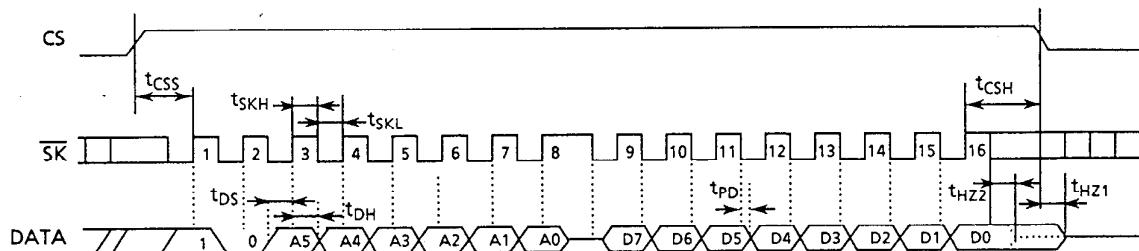

Figure 4

### (2) Write (PROGRAM) mode

After changing CS from "L" to "H", this mode inputs the op code, address, and data (eight-bit) into DATA, synchronized with the rise of  $\overline{SK}$ . After data is input, by changing CS from "H" to "L" again, data is written to the chip (the write operation). The write operation time is decided by the timer inside of the IC (10 ms max.).

After the write operation, The S-2900A is automatically in program disable mode. Therefore, the S-2900A must be in program enable mode through executing the PEN instruction before the write operation.

For confirming completion of the write operation, check the status read mode described later.

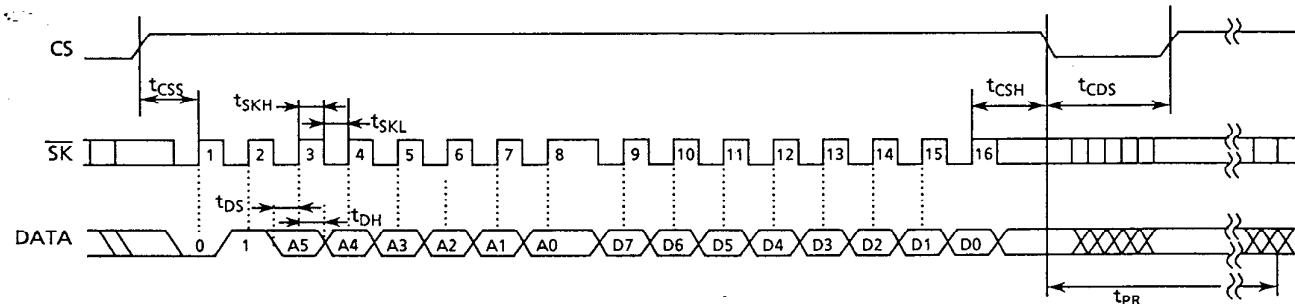

Figure 5

(3) Program enable (PEN) mode

After being in program enable mode through executing the PEN instruction, data can be written (programmed). Before executing a program instruction, the PEN instruction must be executed.

After changing CS from "L" to "H", this mode inputs the op code and address "00<sub>H</sub>" into DATA, synchronized with the rise of  $\overline{SK}$ . When instruction is received at the rise of the eighth  $\overline{SK}$  clock cycle, the S-2900A is in program enable mode.

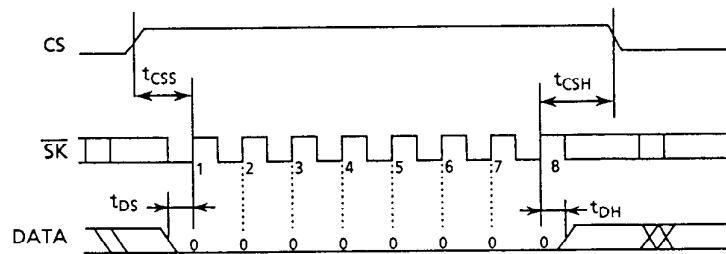

Figure 6

(4) Status read (STRD) mode

STRD confirms whether or not the write operation has been completed. During the write (Busy) operation, low level is output from DATA, and after completing the write operation (Ready status), high level is output.

After changing CS from "L" to "H", this mode inputs the op code and address "3F<sub>H</sub>" into DATA, synchronized with the rise of  $\overline{SK}$ . From the falling edge of the eighth  $\overline{SK}$  clock cycle, the S-2900A outputs the write operation status.
