

# Automotive Temperature Range Spread-Spectrum Econoscillator

DS1091L

## General Description

The DS1091L is a low-cost clock generator that is factory-trimmed to output frequencies from 130kHz to 66.6MHz with a nominal accuracy of  $\pm 0.25\%$ . The device can also produce a center- or down-dithered spread-spectrum output with pin-selectable dither magnitude and rate. Assembled in an 8-pin  $\mu$ MAX package, the DS1091L is designed to operate with a 3.0V to 3.6V power supply over the automotive temperature range ( $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ ).

## Applications

Automotive Infotainment  
POS Terminals  
LCD Displays  
Printers  
Industrial Control

## Features

- ◆ Spread-Spectrum Clock Output from 130kHz to 66.6MHz
- ◆ Operating Temperature Range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- ◆ Accuracy of  $\pm 1.75\%$  Across Temperature and Voltage
- ◆ Factory Trimmed
- ◆ Center-Dithered (DS1091LA) or Down-Dithered (DS1091LB) Spread-Spectrum Output
- ◆ Pin-Selectable Center-Dither Magnitude of 0%,  $\pm 1\%$ ,  $\pm 2\%$ , or  $\pm 4\%$
- ◆ Pin-Selectable Down-Dither Magnitude of 0%,  $-2\%$ ,  $-4\%$ , or  $-8\%$
- ◆ Pin-Selectable Dither Rate
- ◆ 3.0V to 3.6V Supply Operation
- ◆ Lead-Free 8-Pin  $\mu$ MAX Package

## Block Diagram

DS1091L

## Detailed Description

The DS1091L is a clock generator that is capable of output frequencies from 130kHz to 66.6MHz over the full automotive temperature range (-40°C to +125°C). The device also is capable of producing a spread-spectrum (dithered) square-wave output using four pin-selectable dither percentages. Both center (DS1091LA) and down (DS1091LB) dithering options are available. The device also features two selectable dither rates.

The DS1091L is shipped from the factory programmed to a customer-specified frequency.

## Spread Spectrum

The DS1091L has the ability to reduce radiated emission peaks. The dither percentage is controlled by the state of the SEL0 and SEL1 pins. The output frequency can be dithered at 0%, ±1%, ±2%, and ±4%, centered around the programmed frequency (for the DS1091LB this can be down dithered by 0%, -2%, -4%, and -8%).

The two select pins SEL0 and SEL1 provide a means of selecting the dither magnitudes as follows:

A triangle wave generator injects a control signal into the master oscillator to dither its output. The dither rate is a function of the output frequency,  $f_{OUT}$  as well as the setting of the DR pin (see the equation below). Figure 1 shows a plot of the output frequency versus time.

$$\text{DITHER RATE} = \frac{f_{OUT}}{2^n}$$

where  $n$  is defined in Table 2 as a function of output frequency. For example, for an output frequency of 27.0MHz, the dither rate would be 13.2kHz for DR = 0 and 6.6kHz for DR = 1.

### Power-Up

Upon the application of power, the DS1091L output is held in the low state until  $t_{PU}$  has elapsed. This removes any possibility of erroneous output transitions during initial power-up.

## Application Information

### Power-Supply Decoupling

To achieve best results, it is highly recommended that decoupling capacitors are used on the IC power-supply pins. Typical values of decoupling capacitors are 0.01 $\mu$ F and 0.1 $\mu$ F. Use a high-quality, ceramic, surface-mount capacitor, and mount it as close as possible to the VCC and GND pins of the IC to minimize lead inductance.
