DESCRIPTION

The DS1135L series is a low-power, 3V high-speed version of the popular DS1013, DS1033, DS1035 series.

The DS1135L series of delay lines have three independent logic buffered delays in a single package. The device is Dallas Semiconductor's fastest 3-in-1 delay line. It is available in a standard 8-pin 118mil μ SOP and 150mil 8-pin Mini-SO.

The device features precise leading and trailing edge accuracy. It has the inherent reliability of an all-silicon delay line solution.

Standard delay values are indicated in Table 1. Customers may contact Dallas Semiconductor at (972) 371-4348 for further information on custom delay values.

1. Nominal conditions are +25°C and $V_{CC} = +3.3V$.
2. Voltage range of 2.7V to 3.6V.
3. Delay accuracies is for both leading and trailing edges.
4. X in Part number denotes package: U indicates μ SOP, Z indicates SO.

TEST SETUP DESCRIPTION

Figure 2 illustrates the hardware configuration used for measuring the timing parameters of the DS1135L. The input waveform is produced by a precision pulse generator under software control. Time delays are measured by a time interval counter (20 ps resolution) connected to the output. The DS1135L output taps are selected and connected to the interval counter by a VHF switch control unit. All measurements are fully automated with each instrument controlled by the computer over an IEEE 488 bus.
