μ PD703031A, 703031AY, 703033A, 703033AY, 70F3033A, 70F3033AY

V850/SB1™

32-/16-BIT SINGLE-CHIP MICROCONTROLLERS

DESCRIPTION

The μ PD703031A, 703031AY, 703033A, 703033AY, 70F3033A, and 70F3033AY (V850/SB1) are 32-/16-bit single-chip microcontrollers of the V850 Family™ for AV equipment. 32-bit CPU, ROM, RAM, timer/counters, serial interfaces, A/D converter, DMA controller, and so on are integrated on a single chip.

The μ PD70F3033A and 70F3033AY have flash memory in place of the internal mask ROM of the μ PD703033A and 703033AY. Because flash memory allows the program to be written and erased electrically with the device mounted on the board, these products are ideal for the evaluation stages of system development, small-scale production, and rapid development of new products.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

V850/SB1, V850/SB2™ User's Manual Hardware: U13850E
V850 Family User's Manual Architecture: U10243E

FEATURES

- Number of instructions: 74
- Minimum instruction execution time: 50 ns (@ internal 20 MHz operation)
- General-purpose registers: 32 bits × 32 registers
- Instruction set: Signed multiplication, saturation operations, 32-bit shift instructions, bit manipulation instructions, load/store instructions
- Memory space: 16 MB linear address space
- Internal memory ROM: 128 KB (μ PD703031A, 703031AY: mask ROM)
 256 KB (μ PD703033A, 703033AY: mask ROM)
 256 KB (μ PD70F3033A, 70F3033AY: flash memory)
- RAM: 12 KB (μ PD703031A, 703031AY)
 16 KB (μ PD703033A, 703033AY, 70F3033A, 70F3033AY)
- Interrupt/exception: μ PD703031A, 703033A, 70F3033A (external: 8, internal: 30 sources, exception: 1 source)
 μ PD703031AY, 703033AY, 70F3033AY (external: 8, internal: 31 sources, exception: 1 source)
- I/O lines Total: 83
- Timer/counters: 16-bit timer (2 channels: TM0, TM1)
 8-bit timer (6 channels: TM2 to TM7)
- Watch timer: 1 channel
- Watchdog timer: 1 channel

- Serial interface
 - Asynchronous serial interface (UART0, UART1)
 - Clocked serial interface (CSI0 to CSI3)
 - 3-wire variable length serial interface (CSI4)
 - I²C bus interface (I²C0, I²C1) (μPD703031AY, 703033AY, 70F3033AY only)
- 10-bit resolution A/D converter: 12 channels
- DMA controller: 6 channels
- Real-time output port: 8 bits × 1 channel or 4 bits × 2 channels
- ROM correction: 4 places can be corrected
- Power-saving function: HALT/IDLE/STOP modes
- Packages: 100-pin plastic LQFP (fine pitch) (14 × 14)
100-pin plastic QFP (14 × 20)
- μPD70F3033A, 70F3033AY
 - Can be replaced with μPD703033A and 703033AY (internal mask ROM) in mass production

APPLICATIONS

- AV equipment (audio, car audio, VCR, TV, etc.)

1. DIFFERENCES AMONG PRODUCTS

1.1 Differences of μPD703031A, 703031AY, 703033A, 703033AY, 70F3033A, and 70F3033AY

Part Number / Item	μPD703031A	μPD703031AY	μPD703033A	μPD703033AY	μPD70F3033A	μPD70F3033AY
Internal ROM	128 KB (mask ROM)		256 KB (mask ROM)		256 KB (flash memory)

Flash memory programming mode	None				Provided (V _{PP} = 7.8 V)	
I ² C bus interface pins (SCL0, SCL1, SDA0, SDA1)	None	Provided	None	Provided	None	Provided
Electrical specifications	Current consumption, etc. differs.					
Others	Noise immunity and noise radiation differ because circuit scale and mask layout differ.					

- Cautions 1. There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing an application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations for the commercial samples (not engineering samples) of the mask ROM version.**
- 2. When replacing the flash memory versions with mask ROM versions, write the same code in the empty area of the internal ROM.**

Caution Three power supply systems are available to supply power to the I/O buffers of the V850/SB1's pins: EV_{DD}, BV_{DD}, and AV_{DD}. The voltage ranges that can be used for these I/O buffer power supplies are shown below.

EV_{DD}, BV_{DD}: 3.0 V to 5.5 V

AV_{DD}: 4.5 V to 5.5 V

The electrical specifications differ depending on whether the power supply voltage range is 3.0 V to under 4.0 V, or 4.0 V to 5.5 V.

Figure 2-1. Pin Input/Output Circuits (1/2)

Caution V_{DD} in the circuit diagrams can be read as EV_{DD}, BV_{DD}, or AV_{DD}, as appropriate.

Figure 2-1. Pin Input/Output Circuits (2/2)

Caution V_{DD} in the circuit diagrams can be read as EV_{DD} , BV_{DD} , or AV_{DD} , as appropriate.

3. PROGRAMMING FLASH MEMORY (μPD70F3033A, 70F3033AY ONLY)

There are the following two methods for writing a program to the flash memory.

(1) On-board programming

Write a program to the flash memory using a dedicated flash programmer after the μPD70F3033A and 70F3033AY have been mounted on the target board. Also mount a connector, etc. on the target board to communicate with the dedicated flash programmer.

(2) Off-board programming

Write a program using a dedicated adapter before the μPD70F3033A and 70F3033AY have been mounted on the target board.

3.1 Selecting Communication Mode

To write the flash memory, use a dedicated flash programmer and serial communication. Select a serial communication mode from those listed in Table 3-1 in the format shown in Figure 3-1. Each communication mode is selected by the number of V_{PP} pulses shown in Table 3-1.

Table 3-1. Communication Modes

Communication Mode	Pins Used	Number of V _{PP} Pulses
CSI0	SO0 (serial data output) SI0 (serial data input) SCK0 (serial clock input)	0
CSI0 + HS	SO0 (serial data output) SI0 (serial data input) SCK0 (serial clock input) P15 (3-wire + handshake signal output of handshake communication)	3
UART0	TXD0 (serial data output) RXD0 (serial data input)	8

Figure 3-1. Communication Mode Selecting Format

3.2 Function of Flash Memory Programming

Operations such as writing to flash memory are performed by various command/data transmission and reception operations according to the selected communication mode. The major functions are shown below.

Table 3-2. Major Functions of Flash Memory Programming

Function		Description
Category	Command	
Verify	Batch verify	Compares the contents of the entire memory and the input data.
Erase	Batch erase	Erases the contents of the entire memory.
	Write back	Writes back the contents which is overerased.
Blank check	Batch blank check	Checks the erase state of the entire memory.
Data write	High-speed write	Writes data by the specification of the write start address and the number of bytes to be written, and executes verify check.
	Continuous write	Writes data from the address following the high-speed write command executed immediately before, and executes verify check.
System setting/control	Status read out	Reads out the status of operations.
	Oscillation frequency setting	Sets the oscillation frequency.
	Erase time setting	Sets the erase time of batch erase.
	Write time setting	Sets the write time of data write.
	Write back time setting	Sets the write back time.
	Baud rate setting	Sets the baud rate when using UART0.
	Silicon signature	Reads out the silicon signature information.
	Reset	Restarts the system of flash programmer.

3.3 Connecting Dedicated Flash Programmer

The connection of the dedicated flash programmer and the μPD70F3033A and 70F3033AY differs according to the communication mode. The connections for each communication mode are shown below.

- Notes 1.** Ports 4, 5, 6, 9, CLKOUT, and their alternate-function pins
- 2.** Ports 0, 1, 2, 3, 10, 11, $\overline{\text{RESET}}$, and their alternate-function pins
- 3.** Ports 7, 8, and their alternate-function pins
- 4.** Be sure not to exceed the absolute maximum ratings (MAX. value) of each supply voltage.

- Cautions**
1. Do not directly connect the output (or I/O) pins of IC products to each other, or to V_{DD}, V_{CC}, and GND. Open-drain pins or open-collector pins, however, can be directly connected to each other. Direct connection of the output pins between an IC product and an external circuit is possible, if the output pins can be set to the high-impedance state and the output timing of the external circuit is designed to avoid output conflict.
 2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.
The ratings and conditions indicated for DC characteristics and AC characteristics represent the quality assurance range during normal operation.

Oscillation frequency	f _{xx}		2		20	MHz
Oscillation stabilization time	–	Upon reset release		2 ¹⁹ /f _{xx}		s
	–	Upon STOP mode release		Note		s

Note The TYP. value differs depending on the setting of the oscillation stabilization time select register (OSTS).

- Cautions**
1. Main system clock oscillator operates on the output voltage of the on-chip regulator. External clock input is prohibited.
 2. When using the main system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figure to avoid an adverse effect from wiring capacitance.
 - Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
 3. Ensure that the duty of oscillation waveform is between 5.5 and 4.5.
 4. Sufficiently evaluate the matching between the μPD703031A, 703031AY, 703033A, 703033AY, 70F3033A, 70F3033AY and the resonator.

Capacitance load of each bus line		-	C _b	-	400	-	400	pF

Notes 1. At the start condition, the first clock pulse is generated after the hold time.

2. The system requires a minimum of 300 ns hold time internally for the SDAn signal (at V_{IHmin.} of SCLn signal) in order to occupy the undefined area at the falling edge of SCLn.

3. If the system does not extend the SCLn signal low hold time (t_{LOW}), only the maximum data hold time (t_{HD:DAT}) needs to be satisfied.

4. The high-speed mode I²C bus can be used in the normal-mode I²C bus system. In this case, set the high-speed mode I²C bus so that it meets the following conditions.

- If the system does not extend the SCLn signal's low state hold time:

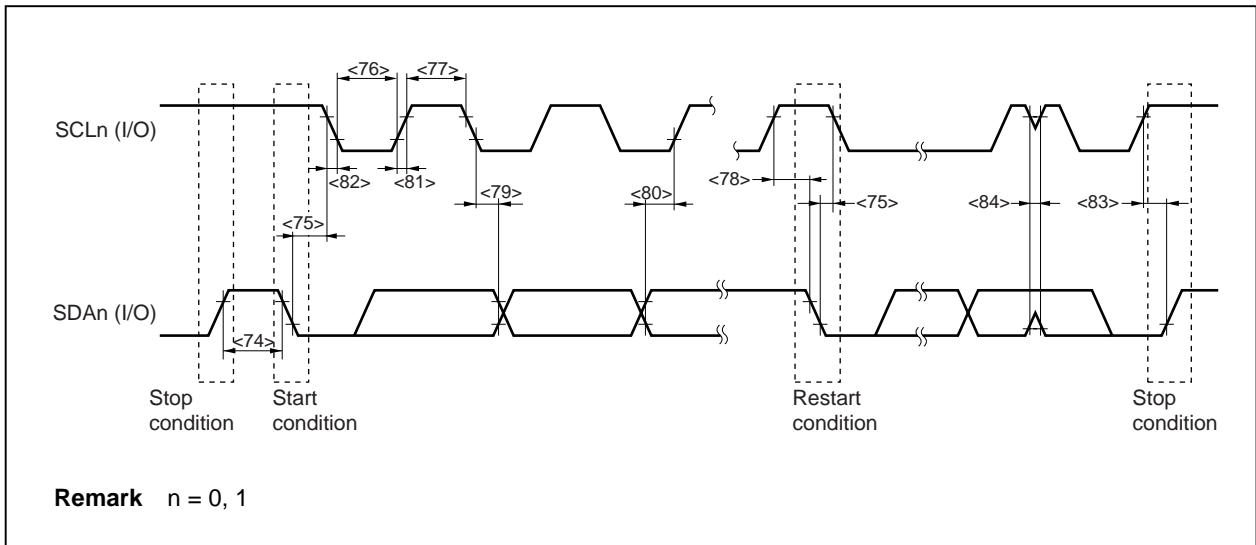

$$t_{HD:DAT} \geq 250 \text{ ns}$$

- If the system extends the SCLn signal's low state hold time:

Transmit the following data bit to the SDAn line prior to the SCLn line release (t_{Rmax.} + t_{SU:DAT} = 1000 + 250 = 1250 ns: Normal mode I²C bus specification).

5. C_b: Total capacitance of one bus line (unit: pF)

Regulator ($T_A = -40$ to $+85^\circ\text{C}$, $V_{DD} = 4.0$ to 5.5 V, $V_{SS} = 0$ V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Output stabilization time	<85> t_{REG}	Stabilization capacitance $C = 1 \mu\text{F}$ (Connected to REGC pin)	1			ms

- Cautions**
1. Be sure to start inputting supply voltage (V_{DD}) when $\overline{\text{RESET}} = V_{SS} = EV_{SS} = BV_{SS} = 0$ V (the above state), and make $\overline{\text{RESET}}$ high level after the t_{REG} period has elapsed.
 2. If supply voltage (BV_{DD} or EV_{DD}) is input before the t_{REG} period has elapsed following the input of supply voltage (V_{DD}), data may be driven from the pins until the t_{REG} period has elapsed because the I/O buffers' power supply was turned on while the circuit was in an undefined state. To avoid this situation, it is recommended to input supply voltage (BV_{DD} or EV_{DD}) after the t_{REG} period has elapsed following the input of supply voltage (V_{DD}).

6. RECOMMENDED SOLDERING CONDITIONS

The μPD703031A, 703031AY, 703033A, 703033AY, 70F3033A, and 70F3033AY should be soldered and mounted under the following recommended conditions.

For the details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

Table 6-1. Surface Mounting Type Soldering Conditions (1/2)

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Caution Purchase of NEC I²C components conveys a license under the Philips I²C Patent Rights to use these components in an I²C system, provided that the system conforms to the I²C Standard Specification as defined by Philips.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.
- NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.
- Descriptions of circuits, software, and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software, and information in the design of the customer's equipment shall be done under the full responsibility of the customer. NEC Corporation assumes no responsibility for any losses incurred by the customer or third parties arising from the use of these circuits, software, and information.
- While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.
- NEC devices are classified into the following three quality grades:
"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.
