## 1.5A / 3-TERMINAL ADJUSTABLE REGULATOR

DESCRIPTION	FEATURES
<p>The AMC317 series is a 3-terminal adjustable regulator featuring output current of typical 1.5A over a wide output range from 1.2V to 37V. Only two external resistors are required to set the output voltage. This feature provides better line and load regulation than fixed regulators.</p> <p>Also, the AMC317 series offers full overload protection, current limit, and thermal protection features. In most applications, no capacitor is required for the AMC317. However, if the device is located far from the input filter capacitor, then an input bypass will be required. Also, in order to improve the transient response, an output capacitor is recommended.</p>	<ul style="list-style-type: none"> <li>■ <b>Output current capability of 1.5A</b></li> <li>■ <b>Wide output voltage range – adjustable from 1.2V to 37V</b></li> <li>■ <b>Ripple rejection typically 80 dB</b></li> <li>□ Typically 0.1% load regulation</li> <li>□ Built-in over current, over temperature and overload protection.</li> <li>□ Internal thermal overload protection</li> <li>□ Available in 3-Lead TO-220, and surface mount 3-Lead TO-263.</li> <li>□ Identical pin assignment to earlier LM317 series.</li> </ul>

**TYPICAL APPLICATION**

**Note 1:**  $C_{IN}$  is required if the regulator is far from the filter capacitor.

**Note 2:**  $C_{OUT}$  is recommended to improve the transient response.

**Note 3:**  $V_{OUT} = 1.25V \left( 1 + \frac{R2}{R1} \right) + I_{ADJ}(R2)$

**ABSOLUTE MAXIMUM RATINGS (Note 1)**

Input-Output Differential Voltage $V_D$ .....	40V
Operating Junction temperature	
Plastic (T, ST Package) .....	150°C
Storage Temperature Range .....	-65°C to 150°C
Lead temperature (Soldering, 10 seconds) .....	300°C
Note 1: Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground. Currents are positive into, negative out of the specified terminal.	

**THERMAL DATA**

<b>T, ST PACKAGE:</b>	
Thermal Resistance-Junction to Tab, $\theta_{JT}$	3.0°C/W
Thermal Resistance-Junction to Ambient, $\theta_{JA}$	45°C/W
Junction Temperature Calculation: $T_J = T_A + (P_D \times \theta_{JA})$ . The $\theta_{JA}$ numbers are guidelines for the thermal performance of the device/pc-board system. All of the above assume no ambient airflow.	

**Maximum Power Calculation:**

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_{A(MAX)}}{\theta_{JA}}$$

$T_J(^{\circ}C)$ : Maximum recommended junction temperature

$T_A(^{\circ}C)$ : Ambient temperature of the application

$\theta_{JA}(^{\circ}C/W)$ : Junction-to-junction temperature thermal resistance of the package, and other heat dissipating materials.

**The maximum power dissipation for a single-output regulator is :**

$$P_{D(MAX)} = [(V_{IN(MAX)} - V_{OUT(NOM)}) \times I_{OUT(NOM)} + V_{IN(MAX)} \times I_Q]$$

Where:  $V_{OUT(NOM)}$  = the nominal output voltage

$I_{OUT(NOM)}$  = the nominal output current, and

$I_Q$  = the quiescent current the regulator consumes at  $I_{OUT(MAX)}$

$V_{IN(MAX)}$  = the maximum input voltage

Then  $\theta_{JA} = (150^{\circ}C - T_A) / P_D$

ELECTRICAL CHARACTERISTICS						
Unless otherwise specified, these specifications in <b>bold type</b> apply over the operating ambient temperature of 0°C to +70°C, $V_{IN} - V_{OUT} = 5V$ , $I_{OUT} = 10mA$ , $C_{IN} = 0.1\mu F$ , $C_{OUT} = 1.0\mu F$ , and are for DC characteristics only. (Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.)
