

DESCRIPTION

The AMC393 series is designed containing two independent precision voltage comparators with low offset voltage of 2.0 mV typical. It can operate from a single power supply over a wide range from 5V to 30V.

Operation from split power supplies is also applicable and the low power supply current is independent of the magnitude of the power supply voltage.

The AMC393 series has the unique characteristic in that the input common-mode voltage range includes ground, even though it is operated from a single power supply voltage.

FEATURES

- **Wide supply voltage range**
- **Low supply current (typical 0.4 mA), independent of the magnitude of supply voltage**
- **Operated by either single supply or dual supplies**
- **Low input offset voltage (typical 2mV)**
- **Low input biasing current**
- **Input common-mode voltage range includes ground**
- **Pin assignment identical to earlier LM393 series.**

APPLICATIONS

- Limit Comparators
- Simple Analog to Digital Converters
- Pulse, Square Wave Generators
- Wide Range VCO
- MOS Clock Timers

SCHEMATIC DIAGRAM (each comparator)

ABSOLUTE MAXIMUM RATINGS (Note 1)

Input Supply Voltage	32V
Input Voltage	-0.3V to 30V
Differential Input Voltage	32V
Operating Junction Temperature Range, T_J	150°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (soldering, 10 seconds)	260°C
Note 1: Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground. Currents are positive into, negative out of the specified terminal.	

ELECTRICAL CHARACTERISTICS

Unless otherwise specified, these specifications apply the operating at specified free-air temperatures and $V_{CC} = 5V$.

		$T_A = 25^{\circ}C$ $0^{\circ}C \leq T_A \leq 70^{\circ}C$			700	
Low-level Output Current	I_{OL}	$V_{OUT} \leq 1.5V$, $V_{IN}^{+} - V_{IN}^{-} = -1V$ $T_A = 25^{\circ}C$	6			mA
High-level Output Current	I_{OH}	$V_{OUT} = 5V$, $V_{IN}^{+} - V_{IN}^{-} = 1V$		0.1		nA
		$T_A = 25^{\circ}C$ $0^{\circ}C \leq T_A \leq 70^{\circ}C$			1	μA
Large Signal Voltage Gain	A_{VD}	$V_{CC} = 15V$, $V_{OUT} = 1.4V$ to $11.4V$, $R_L \geq 15 k\Omega$ to V_{CC}	50	200		V/mV
Response Time (Note 4)		$R_L = 5.1K$ connected to $5V$ $T_A = 25^{\circ}C$		1.3		μs

Note 1: $V_{OUT} \cong 1.4V$, $R_S = 0\Omega$, with V_{CC} from $5V$ to $30V$; and over the full input common-mode range ($0V$ to $V_{CC} - 1.5V$) at $25^{\circ}C$.

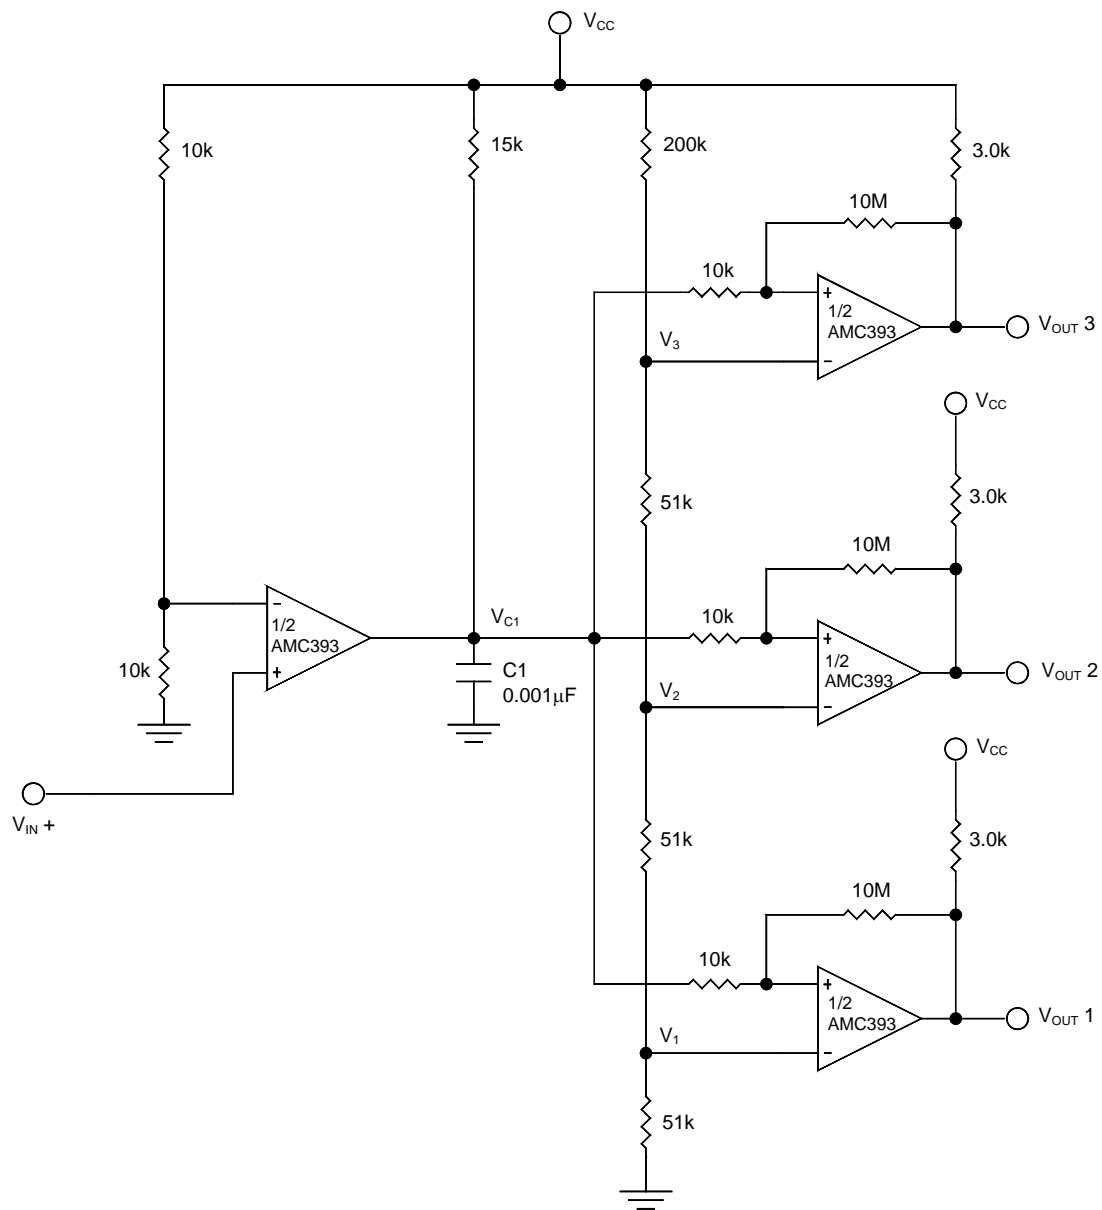

Note 2: Due to PNP input stage, the direction of the input current is out of the IC. It is essentially constant, independent of the state of the output, so no loading change exists on the input lines.

Note 3: The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than $0.3V$ (at $25^{\circ}C$). The upper limit of the common-mode voltage range is $V_{CC} - 1.5V$ (at $25^{\circ}C$), but either or both inputs can go to $32V$ without damage, independent of the magnitude of V_{CC} .

Note 4: The response time specified is for a $100 mV$ input step with $5 mV$ overdrive.
