

Description

The μPD75P54 and μPD75P64 are 1024 x 8-bit on-chip, one-time programmable (OTP) ROM versions of the mask ROMs, μPD7554 and μPD7564. They have the same functions as, and are pin-compatible with, their mask ROMs. Because of their programming capabilities, the μPD75P54/P64 are suitable for evaluation and small lot production for system development. Their unique features will be described in this data sheet. For information about the base part μPD7554/64, please refer to its data sheet.

Features

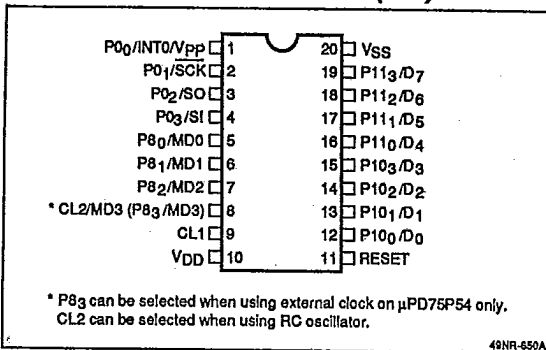

- 47 instructions (subset of μPD7500 set B)
- Instruction cycle:
 - External clock (μPD75P54): 2.86 μs/700 kHz, 5 V
 - RC oscillator (μPD75P54): 4 μs/500 kHz, 5 V
 - Ceramic oscillator (μPD75P64): 2.86 μs/700 kHz, 5 V
- Program memory (ROM) of 1024 x 8 bits
- Data memory (RAM) of 64 x 4 bits
- 8-bit timer/event counter
- 8-bit serial interface
- I/O lines: 16-μPD75P54; 15-μPD75P64
- Data memory retention at low supply voltage
- CMOS technology
- Low-power consumption
- Single power supply:
 - 4.5 to 6.0 V normal operation
 - 6.0 V OTP
- STOP, HALT standby functions
- 20-pin plastic shrink DIP or SOP (OTP)

Ordering Information

Part Number	Package Type
μPD75P54CS	20-pin plastic shrink DIP (OTP)
μPD75P64CS	
μPD75P54G	20-pin plastic SOP (OTP)
μPD75P64G	

Pin Configuration

20-Pin Plastic Shrink DIP or SOP (OTP)

Pin Identification

Symbol	Function
P0 ₀ /INT0/V _{PP}	4-bit Input port 0/count clock input/serial interface. Programming voltage supply pin for program memory write/verify.
P0 ₁ /SCK	
P0 ₂ /SO	
P0 ₃ /SI	
P8 ₀ -P8 ₂ /MD0-MD2 CL2/MD3 (P8 ₃ /MD3)	4-bit output port 8/OTP operation mode. Connection for ceramic resonator or RC (No P8 ₃ on μ PD75P64) (Note 1)
CL1	Connection for ceramic resonator or RC
V _{DD}	4.5 to 6.0 V power supply, normal operation. 6.0 V for OTP.
RESET	Reset input pin
P10 ₁ -P10 ₃ /D ₀ -D ₃	4-bit I/O port 10 and D ₀ -D ₃ during programming write/verify.
P11 ₀ -P11 ₃ /D ₄ -D ₇	4-bit I/O port 11 and D ₄ -D ₇ during programming write/verify.
V _{SS}	Ground

Note:

(1) MD0-MD3 are used as mode select pins during programming.

PIN FUNCTIONS

P0₀/INT0/V_{PP}, P0₁/SCKP0₂/SO, P0₃/SI

(Port 0/Count Clock Input/Programming/Serial Interface)

4-bit Input port 0/count clock input/serial I/O interface. This port can be configured as a 4-bit parallel input port or as the 8-bit serial I/O interface, under control of the serial mode select register. The serial input SI (active high), serial output SO (active low), as the serial clock SCK (active low—synchronizes data transfer) comprise the 8-bit serial I/O interface. If P0₀/INT0 is unused, connect it to ground. If any of P0₁-P0₃ are unused, connect them to ground. The port is in the input state at reset.

P8₀-P8₂/MD0-MD2, P8₃/MD3 (CL2/MD3)
(Port 8/Clock Input/Mode Selection for OTP)

4-bit output port 8. This port can sink 15 mA and interface 12 V. P8₃ is an output port on the μ PD75P64. On the μ PD75P54, CL2 is one of the pins to which a resistor for RC oscillation is connected. On the μ PD75P64, CL2 is one of the pins to which a ceramic resonator is connected. If any of P8₀-P8₂ pins are unused, leave them open. The port is in the high impedance state at reset. MD0-MD3 are used for OTP program memory write and read mode selection. There is no P8₃ on the μ PD75P64.

CL1 (Clock Input 1)

On the μ PD75P54, CL1 is one of the two pins to which a resistor for RC oscillation is connected. On the μ PD75P64, CL1 is one of the two pins to which a ceramic resonator is connected.

V_{DD} (Power Supply)

Positive power supply. 4.5 to 6.0 V for normal operation. 6.0 V for program memory write/verify.

RESET (Reset)

System reset input pin (active high). This pin is not internally connected to a pull-down resistor.

P10₀-P10₃/D₀-D₃ (Port 10/Data I/O)

4-bit I/O port. This port can sink 10 mA and interface 12 V. If any of these pins are unused, connect them to ground or V_{DD} in the input state, or leave open in the output state. The port is in the high impedance or high-level output state at reset. D₀-D₃ are 4-bit I/O pins for program memory write/verify.

P11₀-P11₃/D₄-D₇ (Port 11/Data I/O)

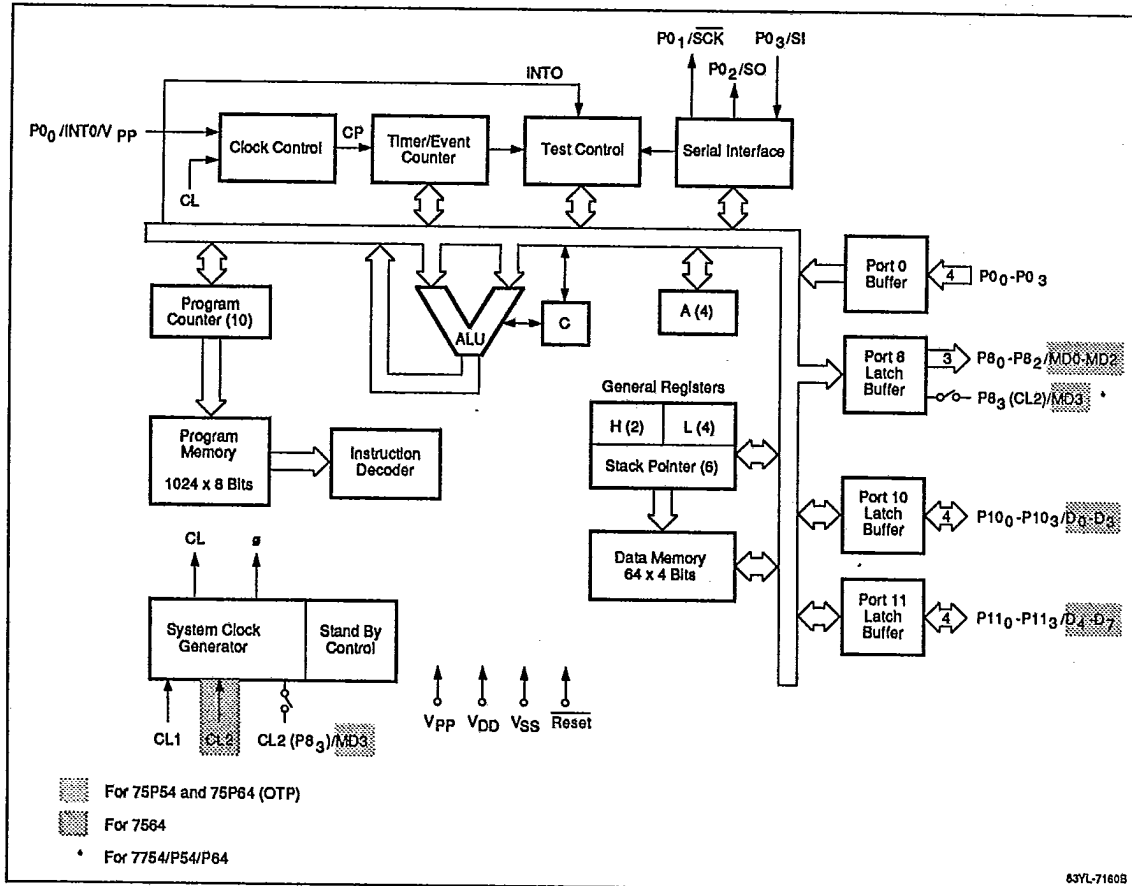

4-bit I/O port. This port can sink 10 mA and interface 12 V. If any of these pins are unused, connect them to ground or V_{DD} in the input state, or leave open in the output state. The port is in the high impedance or high-level output state at reset. D₄-D₇ are 4-bit I/O pins for program memory write/verify.

V_{SS} (Ground)

Ground.

μPD75P54/P64

T-49-19-59

OTP PROM (Program Memory Write and Verify)

The μPD75P54/P64 is a, one-time programmable (OTP) PROM version of the μPD7554/64. The OTP is programmed by the pins and their functions listed in table 2. During OTP programming, addresses are updated by inputting clocks, instead of addresses, from the CL1 pin.

Table 2. OTP Access

Pin	Function
V _{PP}	OTP programming voltage pin (normally V _{DD})
CL1	Address update clock input during programming
MD0-MD3	Mode selection during OTP programming
D ₀ -D ₇	8-bit data I/O pins during OTP programming
V _{DD}	Supply voltage pin; 4.5 to 6.0 V during normal operation; 6 V during OTP programming

Notes:

The μPD75P54/P64 has no erasure window. The program memory data cannot be erased with ultraviolet light.

OTP Operation Mode

The μPD75P54/P64 operates in the program memory write/verify mode when +6 V is applied to V_{DD} and 21 V to V_{PP}. Mode pins MD0-MD3 select the operation modes shown in Table 3.

Table 3. OTP Operation Mode SelectionV_{PP} = +21 V; V_{DD} = +6 V

MD0	MD1	MD2	MD3	Operating Mode
H	L	H	L	Program memory address clear (Note 2)
L	H	H	H	Program memory write (Note 3)
L	L	H	H	Program memory verify (Note 4)
H	X	H	H	Program Inhibit (Note 5)

Notes:

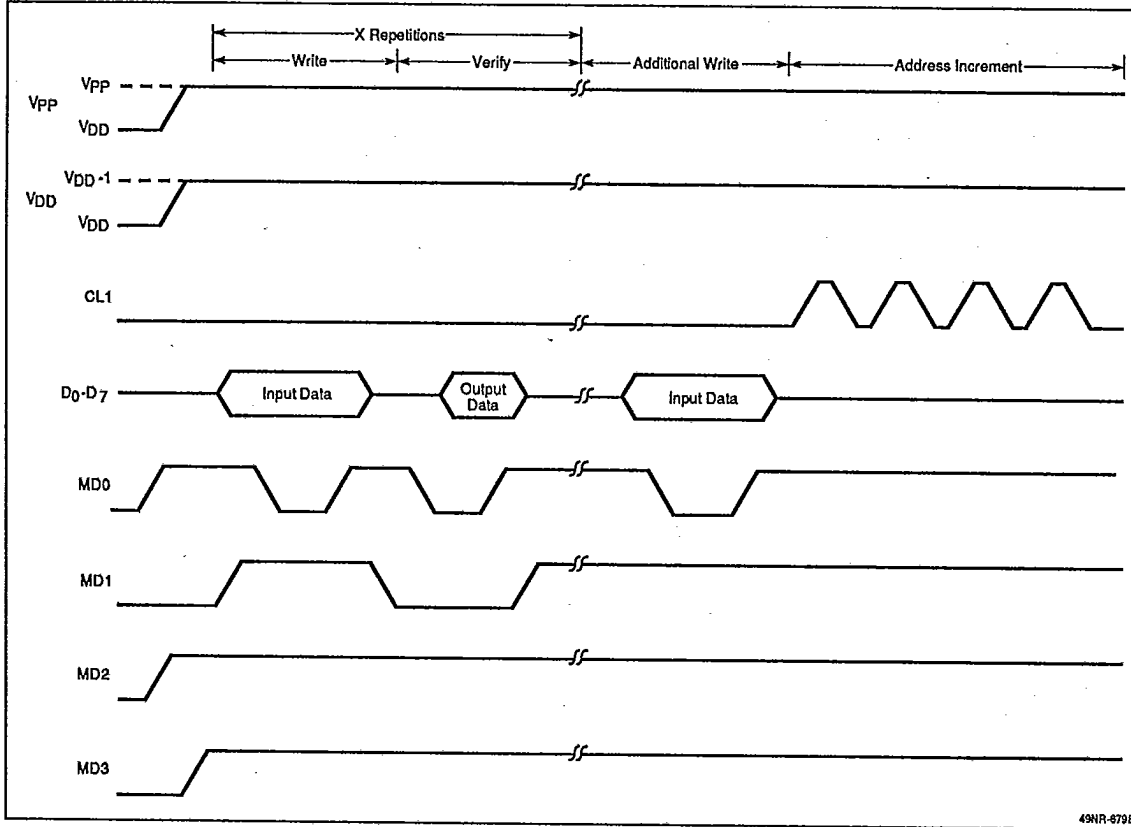

- (1) X = L or H.
- (2) While HLHL is being applied, the program counter continues to be cleared.
- (3) While LHHH is being applied, data applied to D0-D7 continue to be written to the OTP.
- (4) While LLHH is being applied, the OTP contents at the address that the program counter indicates continue to be output to P0-D7.
- (5) While HXHH is being applied, the OTP continues to be non-accessible, and D0-D7 remain at a high impedance level.

Program Memory Write Procedure. The program memory write procedure follows (high speed write is enabled):

- (1) Connect unused pins to V_{SS} through a pull-down resistor. RESET is pulled up to V_{DD} through a resistor. Hold CL1 low.
- (2) Supply 5 V to V_{DD} and V_{PP}.
- (3) Select the program memory address clear mode.
- (4) Change the voltage on V_{DD} to 6 V, and on V_{PP} to 21 V.
- (5) Select the program inhibit mode.
- (6) Write data in the 1 ms write mode.
- (7) Select the program inhibit mode.
- (8) Select the verify mode. If data is written correctly, proceed to step 9; if data is not written correctly, repeat steps 6-8.
- (9) Perform an additional write of X (number of times a write was performed in steps 6-8) x 1 ms.
- (10) Select the program inhibit mode.
- (11) Increment the program memory address by one, by inputting four pulses to CL1.
- (12) Repeat steps 6-11 until the end address occurs.
- (13) Select the program memory address clear mode.
- (14) Change the voltage on V_{DD} and V_{PP} to 5 V.
- (15) Turn off power.

The timing for steps 2-11 is shown in figure 3.

Figure 3. Timing Diagram for OTP Program Memory Write

Program Memory Read Procedure. The program memory read procedure follows:

- (1) Connect unused pins to V_{SS} through a pull-down resistor. RESET is pulled up to V_{DD} through a resistor. Hold CL1 low.
- (2) Supply 5 V to V_{DD} and V_{PP} .
- (3) Select the program memory address clear mode.
- (4) Change the voltage on V_{DD} to 6 V, and on V_{PP} to 21 V.
- (5) Select the program inhibit mode.

- (6) Select the verify mode. Data is read from "000H." Upon entry of a clock pulse to CL1, data is sequentially output by one address in a cycle of four pulses.
- (7) Pulse input to the CL1. Program memory address is updated at the rising edge of the third pulse. Address after updated one (+1) is updated every four pulses. Repeat update to last address.
- (8) Select the program memory address clear mode.
- (9) Change the voltage on V_{DD} and V_{PP} to 5 V.
- (10) Turn off power.

The timing for steps 2-9 is shown in figure 4.
