Motherboard Clock Generator for SIS540/630 with 133MHz FSB

FEATURES

- Generates all clock frequencies for SIS540, SIS630 Pentium II and K6 chip sets, requiring multiple CPU clocks and high speed SDRAM buffers.
- Support 3 CPU clocks, 7PCI and 14 high-speed SDRAM buffers for 3-DIMM applications.
- One I2C selectable 24 or 48MHz clock output (default 24 MHz).
- One 48 MHz USB clock output.
- Two14.318MHz reference clocks.
- Support 2-wire I2C serial bus interface with built-in Vendor ID, Device ID and Revision ID.
- Single byte micro-step linear Frequency Programming via I2C with Glitch free smooth switching.
- Built-in programmable watch dog timer up to 63 seconds with 1-second interval. It will generate a LOW reset output when timer expired.
- Spread Spectrum ±0.25% center or -0.5% down.
- 50% duty cycle with low jitter.
- Available in 300 mil 48 pin SSOP.

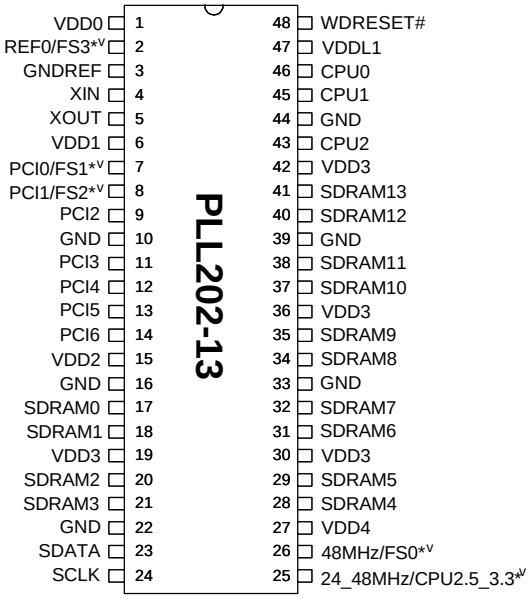
PIN CONFIGURATION



Note: v: Pull down, #: Active low *: Bi-directional latched at power-up

POWER GROUP

- VDD0: PLL CORE
- VDD1: REF0, XIN, XOUT
- VDD2: PCI(0:6)
- VDD3: SDRAM(0:13)
- VDD4: 48MHz, 24_48MHz
- VDDL1: CPU(0:2)

KEY SPECIFICATIONS

- CPU Cycle to Cycle jitter: 250ps.
- PCI to PCI output skew: 500ps.
- CPU to SDRAM output skew: 500ps.
- CPU to CPU output skew: 250ps.
- SDRAM to SDRAM output skew: 250ps.
- CPU to PCI skew (CPU leads): 1 ~ 4 ns.

PIN DESCRIPTIONS

Name	Number	Type	Description
VDD0	1	P	Power supply for PLL Core.
VDD1	6	P	Power supply for REF0, REF1, and crystal oscillator.
VDD2	15	P	Power supply for PCI (0:6).
VDD3	19,30,36,42	P	Power supply for SDRAM (0:13).
VDD4	27	P	Power supply for 24_48MHz and 48MHz.
VDDL1	47	P	Power supply for CPU (0:2) 2.5V.
GND	3,10,16,22, 33,39,44	P	Ground.
XIN	4	I	14.318MHz crystal input to be connected to one end of the crystal.
XOUT	5	O	14.318MHz crystal output.
REF0/FS3* PCI0/FS1* PCI1/FS2* 48MHz/FS0*	2,7,8,26	B	At power up, these pins are input pins and will determine the CPU clock frequency. After input sampling, these pins will generate output clocks. They have internal pull down (low by default).
PCI (0:6)	7,8,9,11,12, 13,14	O	PCI clocks with frequencies defined by Frequency Table.
CPU (0:2)	46,45,43	O	CPU clocks with frequencies defined by Frequency Table.
SDRAM (0:13)	17,18,20,21,28, 29,31,32,34,35, 37,38,40,41	O	SDRAM clocks with frequencies defined by Frequency Table.
SDATA	23	B	Serial data input for serial interface port.
SCLK	24	I	
48MHz	26	O	48MHz output for USB after input data latched during power-up.
24_48MHz/ CPU2.5_3.3*	25	B	Clock output for SUPER I/O after input data latched during power-up. It can be programmed by setting I2C byte1.bit7 to select either 24Mhz (default) or 48Mhz. CPU2.5_3.3 input will program internal CPU skew circuits based on CPU voltage. If high, it selects 2.5V. If Low, it selects 3.3V (default).
WDRESET#	48	O	This pin is an open drain output. It will be Low at watchdog timer expiration.
REF0	2	O	Buffered reference clock after input data latched during power-up.

I2C BUS CONFIGURATION SETTING

Address Assignment	A6	A5	A4	A3	A2	A1	A0	R/W
	1	1	0	1	0	0	1	_
Slave Receiver/Transmitter	Provides both slave write and readback functionality							
Data Transfer Rate	Standard mode at 100kbits/s							
Serial Bits Reading	The serial bits will be read or sent by the clock driver in the following order Byte 0 – Bits 7, 6, 5, 4, 3, 2, 1, 0 Byte 1 – Bits 7, 6, 5, 4, 3, 2, 1, 0 - Byte N – Bits 7, 6, 5, 4, 3, 2, 1, 0							
Data Protocol	This serial protocol is designed to allow both blocks write and read from the controller. The bytes must be accessed in sequential order from lowest to highest byte. Each byte transferred must be followed by 1 acknowledge bit. A byte transferred without acknowledged bit will terminate the transfer. The write or read block both begins with the master sending a slave address and a write condition (0xD2) or a read condition (0xD3). Following the acknowledge of this address byte, in **Write Mode:** the **Command Byte** and **Byte Count Byte must be sent by the master** but ignored by the slave, in **Read Mode:** the **Byte Count Byte** will be **read by the master** then all other **Data Byte**.

PROGRAMMING OF CPU FREQUENCY

To simplify traditional loop counter setting, the PLL202-13 device incorporates SMART-BYTE ™ technology with a single byte programming via I2C to better optimize clock jitter and spread spectrum performance. Detail of PLL202-13's dual mode frequency programming method is described below:

1. ROM-table Frequency Programming:

The pre-defined 32 frequencies found in Frequency table can be accessed either through 5 external jumpers or by setting internal I2C register in BYTE0.

2. Micro-step Linear Frequency Programming:

CPU Frequency can be programmed via I2C in fine and linear positive or negative stepping around selected CPU frequency in Frequency table. The highest step is either +127 or -127. Other bus frequencies will be changed proportionally with the rate that CPU frequency change. The formula is as follow:

$$F_{CPU} = F_{CPU.ROM\text{-}Table} \pm \alpha \text{ (=0.22, 0.15, 0.11 or 0.09)} * M$$

Where:
1. M is magnitude factor defined in I2C Byte 7.bit(0:6)
2. ± (sign bit) of M is defined in I2C Byte7.bit 7
3. α is a constant but related to CPU's seven Timing groups definition
   α = 0.22 (for Group A, B) or α = 0.15 (for Group C,D)
   or α = 0.11 (for Group E, F) or α = 0.09 (for Group G)

FREQUENCY PROGRAMMING EXAMPLE:

1. Procedures to program target CPU frequency to 139.0 Mhz in Group A timing:

A. Locate the closest CPU frequency from Frequency-ROM table: 133.6
B. α = 0.22 for Group A
C. Solve M (Linear Magnitude factor) in integer:

$$M = (F_{CPU} - F_{CPU\text{-}ROMTABLE}) / \alpha$$
$$= (139 - 133.6) / 0.22$$
$$= 25$$

D. Program I2C register:

7	6	5	4	3	2	1	0
0	1	1	1	**1**	1	0	0
FS3	FS2	FS1	FS0	CTR	FS4		

Setting of I2C.BYTE0

7	6	5	4	3	2	1	0
0	0	0	1	1	0	0	1
Sign	M6	M5	M4	M3	M2	M1	M0

Setting of M = +25 in I2C.BYTE7

F_{CPU} = 133.6 + (0.22) * 25 = 139.1 (% of frequency increased = 4.1 %)
F_{SDRAM} = 133.6 * (1+4.1%) = 139.1
F_{PCI} = 33.4 * (1+4.1%) = 34.7

BUILT-IN WATCHDOG TIMER (WDT)

Watchdog timer is used to perform safe recovery if frequency switching causes system to enter into "Hang-up" state within a reasonable period of time (or Watchdog time interval). The watchdog time interval can be programmed between 0 and 63 seconds with increment of 1 second by setting the value of I2C.Byte8.Bit(5:0). Once Enabled, WDT has to be disabled within a period that is shorter than the programmed watchdog interval; otherwise WDT will generate a 500ms low watchdog reset pulse to provoke a system reset. After system restarts, the PLL202-13 will start from predefined Fall-back Frequency (the value of I2C Byte6,bits(7:3)). If system for any reason fails again at Fall-back Frequency, the internal hardware will then generate a watchdog reset to restart the system from the value of external hardware jumper setting to ensure a safe recovery.

Example usage:

1. System power-up at CPU= 66.8MHz (Group A) where external jumpers are used.

2A. Switch to target CPU=100.0MHz frequency (Group C) with following I2C register setting:

7	6	5	4	3	2	1	0	
0	1	1	0	**1**	0	0	0	FSEL Setting in I2C.BYTE0
FS3	FS2	FS1	FS0	CTR	FS4			

7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	M =0 Setting in I2C.BYTE7
Sign	M6	M5	M4	M3	M2	M1	M0	

7	6	5	4	3	2	1	0	
1	0	0	0	1	1	1	1	WD-Timer = 15s Setting in I2C.BYTE8
ENB		T5	T4	T3	T2	T1	T0	

7	6	5	4	3	2	1	0	
0	0	1	1	0	0	0	0	FBSEL Setting in I2C.BYTE6
FB4	FB3	FB2	FB1	FB0				

The fall-back frequency is set to the same location as that of FSEL since frequency switching between different timing groups will cause system to hang up. After WD timer expired or 15 seconds, the system will restart properly at target 100.0MHz if CPU is capable; otherwise WDT will perform another reset action to restart the system from 66.8 Mhz

2B. Switch to target CPU=98Mhz within the same timing Group

The fall-back frequency is recommended to set at the most safe and comfortable level to ensure a successful reboot such as 95 or 96 if system is unable to switch to 98Mhz.

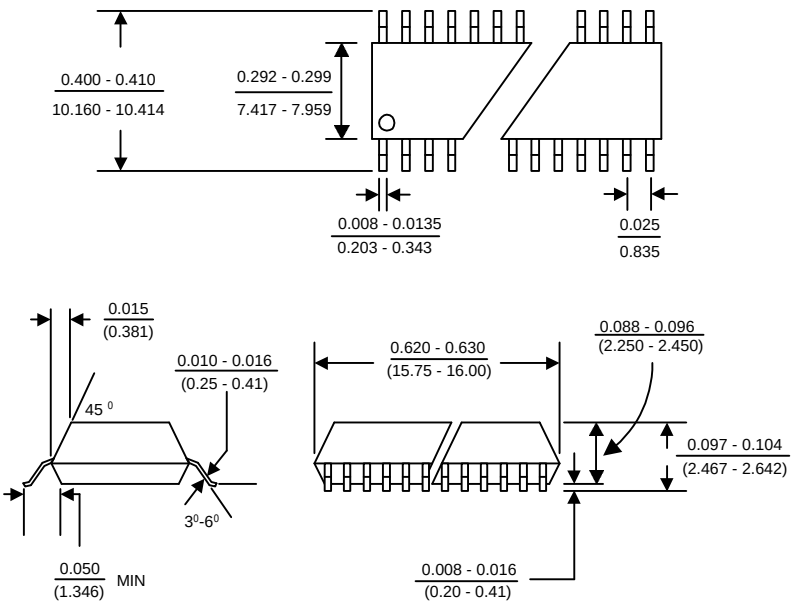
Motherboard Clock Generator for SIS540/630 with 133MHz FSB

PACKAGE INFORMATION



48PIN SSOP

ORDERING INFORMATION

For part ordering, please contact our Sales Department:

47745 Fremont Blvd., Fremont, CA 94538, USA
Tel: (510) 492-0990 Fax: (510) 492-0991

PART NUMBER

The order number for this device is a combination of the following:
Device number, Package type and Operating temperature range

PLL202-13 X C
