

# *Gain and Attenuation Volume Controller IC*

## *One Set of Stereo Input, Low voltage*

### *Gain and Attenuation 15~-79dB*

#### FEATURES

- Operation range: 2.7V~5.5V
- Low power consumption
- Gain / Attenuation: 15 to -79dB
- +1dB/step, -1dB/step and -10dB/step are controlled independently
- I<sup>2</sup>C interface
- Housed in 8 pin SOP package

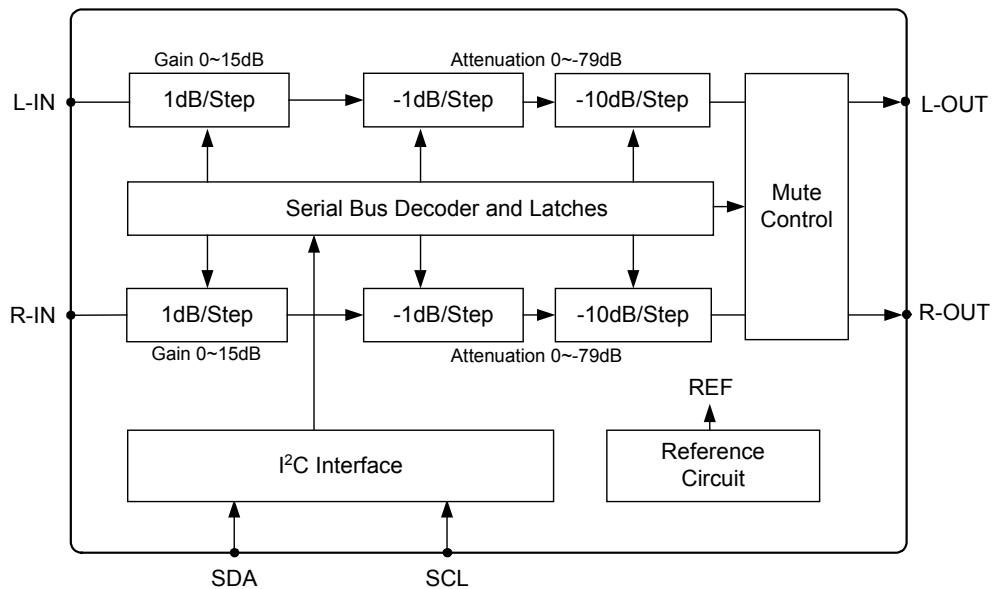

#### APPLICATIONS

- Multimedia system
- Hi-Fi audio system
- MP3, PDA
- Cross-reference PT2257, PT2259

#### DESCRIPTION

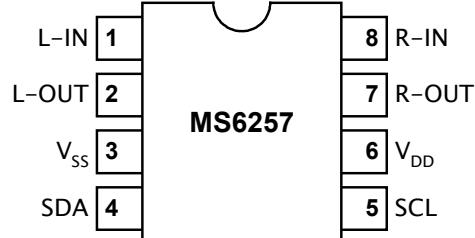

The MS6257 is the stereo audio volume controller IC. It uses CMOS technology specially for the low voltage application with low noise, rail-to-rail output. The MS6257 provide an I<sup>2</sup>C control interface with gain / attenuation range of 15dB to -79dB. The gain and attenuation, +1dB/step, -1dB/step and -10dB/step are controlled independently. The initial condition is set to be maximum attenuation -79dB (-70dB + -9dB), gain 0dB and mute on mode when the power is up.

## I<sup>2</sup>C BUS DESCRIPTION

### Start and stop conditions

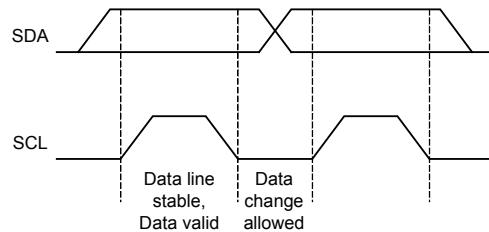

A start condition is activated when the SCL is set to HIGH and SDA shifts from HIGH to LOW state. The stop condition is activated when SCL is set to HIGH and SDA shifts from LOW to HIGH state. Please refer to the timing diagram below.

SCL : Serial Clock Line, SDA : Serial Data Line

### Data validity

A data on the SDA line is considered valid and stable only when the SCL signal is in HIGH state. The HIGH and LOW states of the SDA line can only change when the SCL signal is LOW. Please refer to the figure below.

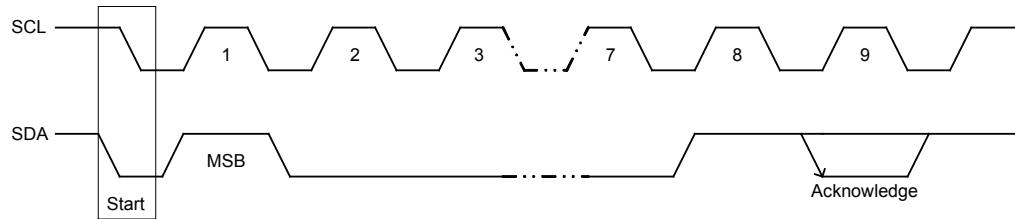

### Byte format

Every byte transmitted to the SDA line consists of 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transmitted first.

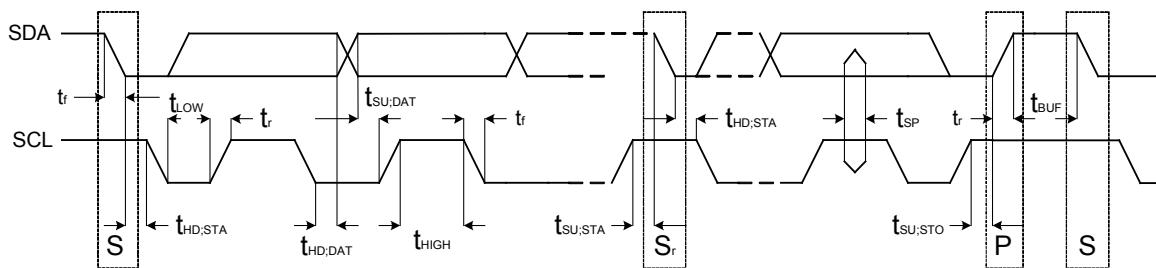

### Acknowledge

During the Acknowledge clock pulse, the master (up) put a resistive HIGH level on the SDA line. The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during the Acknowledge clock pulse so that the SDA line is in a stable LOW state during this clock pulse. Please refer to the diagram below.

The audio processor that has been addressed has to generate an Acknowledge after receiving each byte, otherwise, the SDA line will remain at the HIGH level during the ninth (9<sup>th</sup>) clock pulse. In this case, the master transmitter can generate the STOP information in order to abort the transfer.

$t_f$	Fall time of both SDA and SCL signals	-	300	ns
$t_{SU:STO}$	Set-up time for STOP condition	4.0	-	us
$t_{BUF}$	Bus free time between a STOP and START condition	4.7	-	us
$C_b$	Capacitive load for each bus line	-	400	pF
$V_{nL}$	Noise margin at the LOW level for each connected device (including hysteresis)	$0.1V_{DD}$	-	V
$V_{nH}$	Noise margin at the HIGH level for each connected device (including hysteresis)	$0.2V_{DD}$	-	V

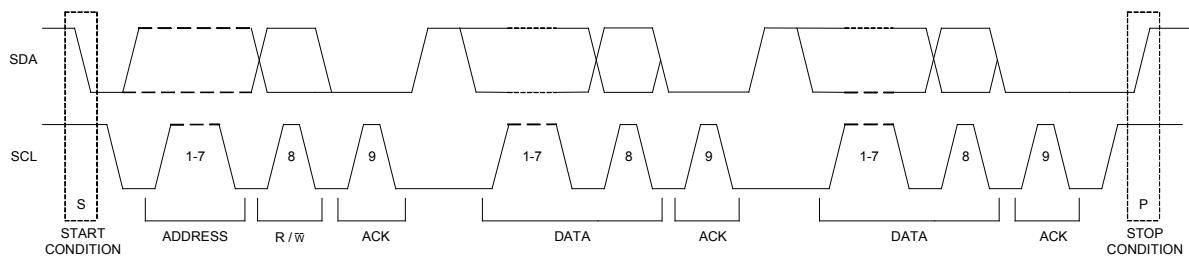

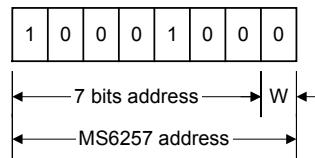

**BUS INTERFACE**

Data are transmitted to and from the MCU to the MS6257 via the SDA and SCL. The SDA and SCL make up the BUS interface. It should be noted that pull-up resistors must be connected to the positive supply voltage.

**Interface protocol**

The format consists of the following

- A START condition
- A chip address byte including the MS6257 address. (7bits)
- The 8<sup>th</sup> bit of the byte must be “0”.(write=0, read=1)
- MS6257 must always acknowledge the end of each transmitted byte.
- A data sequence (N-bytes + Acknowledge)
- A STOP condition

1. Attenuation bit, Ax = -1dB/step, Bx = -10dB/step
2. Gain bit, Cx = +1dB/step
3. Total gain / attenuation equal Ax + Bx + Cx.

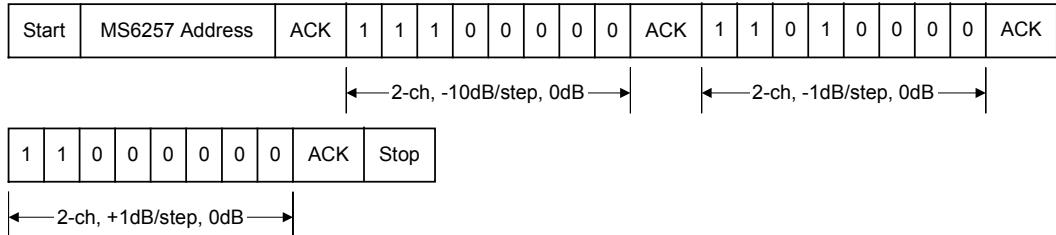

## Example

Mute off

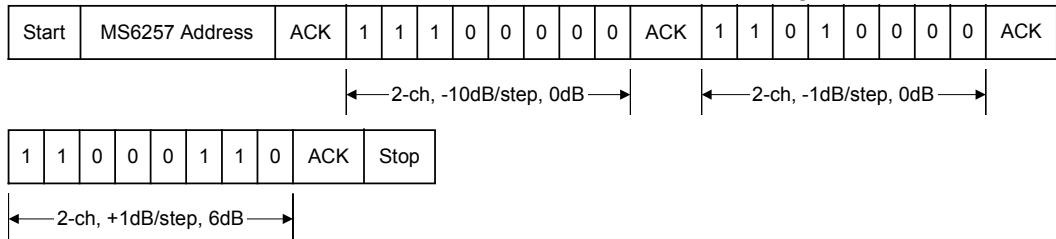

The initial condition is attenuation -79dB, gain 0dB and mute on when power up. The first command must disable the mute function.

Set gain of two channels at 0dB

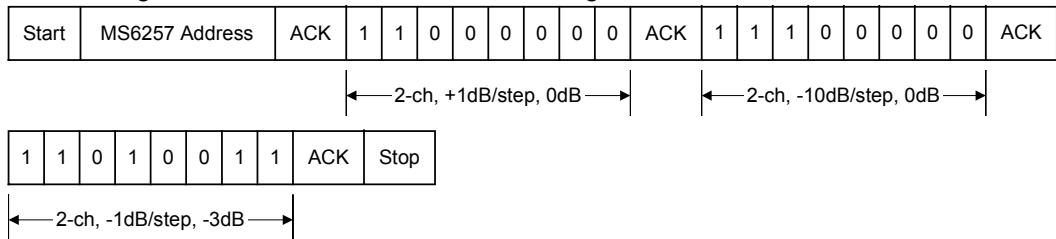

Set gain of two channels at 6dB

The value of attenuation must be set zero when the volume from attenuation to gain.

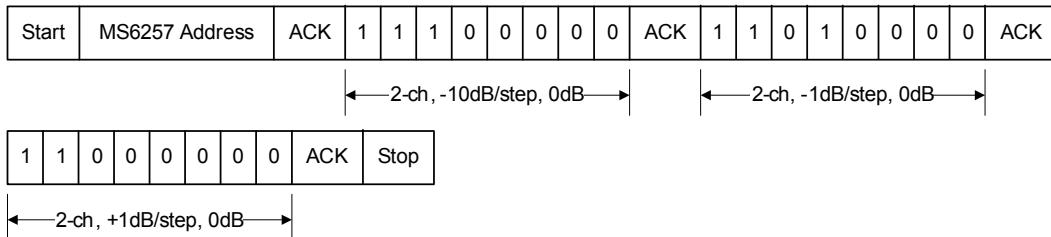

Set gain of two channels at -3dB

The value of gain must be set zero when the volume from gain to attenuation.

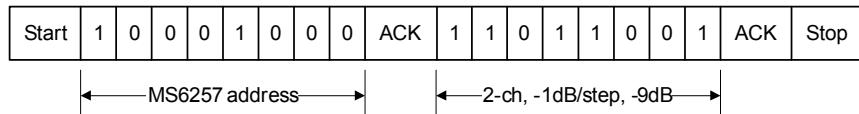

An example of the volume control. (Volume = Ax + Bx + Cx)

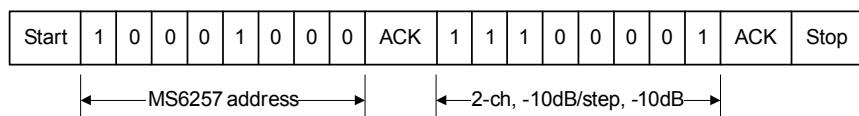

Set two channels at 0dB. (Ax + Bx + Cx = 0dB + 0dB + 0dB)

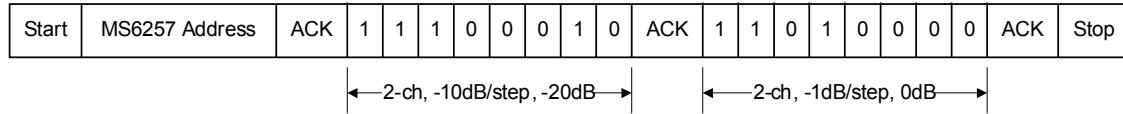

next, the volume changes from 0dB to -9dB. (Ax + Bx + Cx = -9dB + 0dB + 0dB)

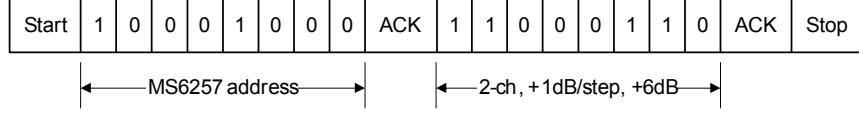

next, the volume changes from -9dB to -19dB. (Ax + Bx + Cx = -9dB + -10dB + 0dB)

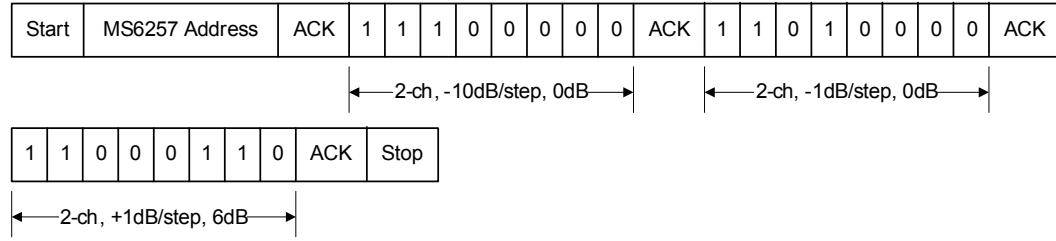

next, the volume changes from -19dB to -20dB. (Ax + Bx + Cx = 0dB + -20dB + 0dB)

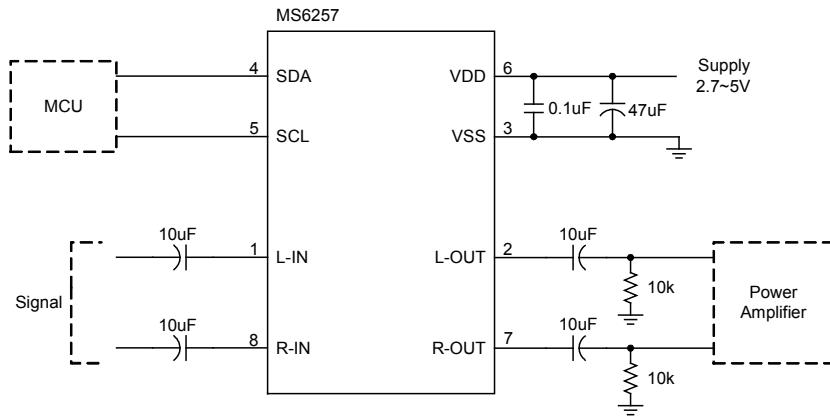

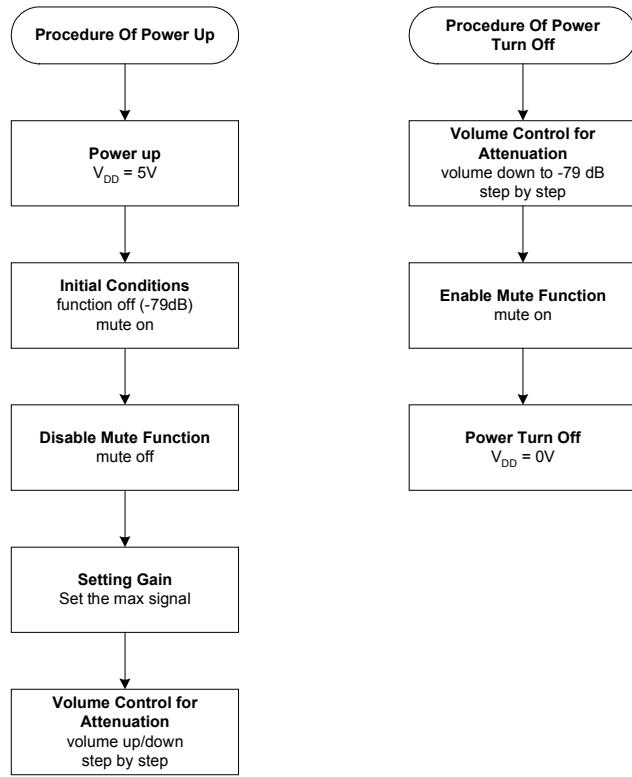

next, the volume changes from -20dB to -14dB. (Ax + Bx + Cx = 0dB + -20dB + 6dB)

next, the volume changes from -14dB to +6dB. (Ax + Bx + Cx = 0dB + 0dB + 6dB)

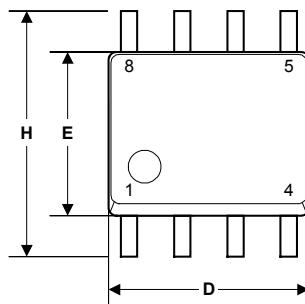

Note: We suggest the gain is set as the power is up. For example, set and fix the gain +10dB, the volume range will be controlled from +10dB to -69dB.

**APPLICATION INFORMATION****Basic application example****Basic application flow chart**

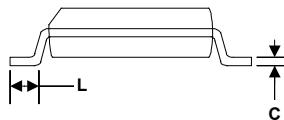

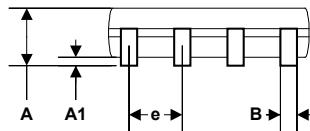

1. The initial condition is attenuation  $-79\text{dB}$ , gain  $0\text{dB}$  and mute on when power is up.

## TAPE AND REEL (Unit : mm)

**DEMO BOARD****Function description****Label 1: Supply Voltage**

The AVDD and DVDD should be the same supply voltage, the supply range is 2.7~5.5 VDC.

**Label 2: LED Indicator**

The LEDs indicate the chip status and IR received status. It keeps on a light state when the MS6257 is active. The other hand, keeps on a dark state when the MS6257 is power-off. It is red-dark blink once when the MCU has received the function code correctly.

**Label 3: Reset**

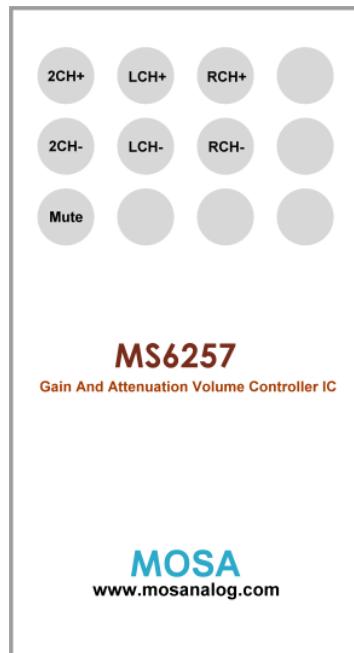

All I/O pins are reset to default values. Volume 0dB and Mute on.

**Label 4: Input section**

Please input stereo audio signal, as music or sine wave.

**Label 5: Output section**

Please connected to a post-power-amplifier, as stereo speaker.

**IR Controller****2-CH+ :** The volume-up switch for stereo channel

The volume increase by +1dB as the switch is pressed once, the maximum value is up to +15dB.

The default value is 0dB on initial status.

L-channel and R-channel are active synchronic.

**2-CH- :** The volume-down switch for stereo channel

The volume decrease by -1dB as the switch is pressed once, the minimum value is up to -79dB.

L-channel and R-channel are active synchronic.

**LCH+ :** The volume-up switch for left channel

The volume increase by +1dB as the switch is pressed once, the maximum value is up to +15dB.

**LCH- :** The volume-down switch for left channel

The volume decrease by -1dB as the switch is pressed once, the minimum value is up to -79dB.

**RCH+ :** The volume-up switch for right channel

The volume increase by +1dB as the switch is pressed once, the maximum value is up to +15dB.

**RCH- :** The volume-down switch for right channel

The volume decrease by -1dB as the switch is pressed once, the minimum value is up to -79dB.

**MUTE :** Press the switch once to enter mute-on or mute-off.

The default status is mute-off on initial status.
