  - Advanced Post-Processors including: 7.1 Bass Manager, Tone Control, 11- Band Parametric EQ, Delay, 2:1/4:1 Decimator, 1:2/1:4 Upsampler

High Definition Audio Decoder DSP Family with Dual 32-bit DSP Engine Technology

- Up to 12 Channels of 32-bit Serial Audio Input
- Customer Software Security Keys
- 16 Ch x 32-bit PCM Out with Dual 192 kHz SPDIF Tx
- Two SPI™/I²C™ ports
- One Parallel Port (144-pin LQFP package only)
- Large On-chip X, Y, and Program RAM & ROM
- SDRAM and Serial Flash Memory Support

The CS4970x4 DSP family is an enhanced version of the CS4953x DSP family with higher overall performance. In addition to all the mainstream audio processing codes in on-chip ROM that the CS4953x DSP offers, the CS4970x4 device family also supports the decoding of major high-definition audio formats. Additionally, the CS4970x4, a dual-core device, performs the high-definition audio decoding on the first core, leaving the second core available for audio post-processing and audio enhancement. The CS4970x4 device supports the most demanding audio post processing requirements. It provides an easy upgrade path to systems currently using the CS495xx or CS4953x device with minor hardware and software changes.

1. Documentation Strategy

The CS4970x4 data sheet describes the CS4970x4 family of multichannel audio decoders. This document should be used in conjunction with the following documents when evaluating or designing a system around the CS4970x4 family of processors.

Table 1. CS4970x4 Related Documentation

Document Name	Description
CS4970x4 Data Sheet	This document
CS4953x4/CS4970x4 System Designer's Guide	A new consolidated documentation set that includes: • Detailed system design information including Typical Connection Diagrams, Boot-Procedures, Pin Descriptions, Etc. Also describes use of DSP Condenser tool. • Detailed firmware design information including signal processing flow diagrams and control API information
AN288 - *CS4953xx/CS497xxx Firmware User's Manual*	Includes detailed firmware design information including signal processing flow diagrams and control API information

The scope of the *CS4970x4 Data Sheet* is primarily the hardware specifications of the CS4970x4 family of devices. This includes hardware functionality, characteristic data, pinout, and packaging information.

The intended audience for the *CS4970x4 Data Sheet* is the system PCB designer, MCU programmer, and the quality control engineer.

2. Overview

The CS4970x4 DSP Family, together with Cirrus Logic's comprehensive library of audio processing algorithms, enables the development of next-generation high-definition audio solutions. Cirrus Logic also provides a broad array of digital interface products and audio converters to meet your audio system-level design requirements.

The CS4970x4 is available in 144-pin and 128-pin LQFP packages. The audio processing features of the CS4970x4 product family are a superset of audio features available in the CS4953xx product family.

Please refer to Table 2 on page 5 for the speed and firmware features of CS4970x4 product family.

1. Processing may be restricted and dependent on firmware selected. Contact your Cirrus Logic FAE for concurrency matrix.
2. Downsampling and Upsampling functionality is located in the operating system. The Cirrus Decimator (Down-Sampler) is also available as a separate post-processing module that is described in the application note, AN288PPI.

2.1 Migrating from the CS495xx(2) to the CS4970x4

The CS4970x4 was designed to provide an easy upgrade path from the CS495xx & CS4953x. Although 144-pin versions of the two devices are virtually identical with respect to external system connection, there are some small differences the hardware designer should be aware of:

- The PLL supply voltage on the CS4970x4 is 3.3V vs. 1.8V on the CS495xx.
- The PLL filter topology is simpler when using the CS4970x4 rather than the CS495xx.
- The CS4970x4 adds support for 6-channel DSD input.
- The CS4970x4 adds support for TDM mode on both audio input and output ports.
- The CS4970x4 does not support external SRAM operation.
- The CS4970x4 external SDRAM bus speed is fixed at 150 MHz vs. the 120 MHz max bus speed for the CS495xx. Some firmware modules also support a 75 MHz CS4970x4 SDRAM bus speed. Please refer to AN304 for details.
- The CS4970x4 CLKOUT pin can output XTALI or XTALI/2. The CS495xx can only output XTALI.

2.2 Licensing

Licenses are required for all of the third party audio decoding/processing algorithms listed below, including the application notes. Please contact your local Cirrus Sales representative for more information.

3. Code Overlays

The suite of software available for the CS4970x4 family consists of operating systems (OS) and a library of overlays. The overlays have been divided into three main groups called Decoders, Matrix-processors, and Post-processors. All software components are defined in the following list:

- **OS/Kernel** - Encompasses all non-audio processing tasks, including loading data from external memory, processing host messages, calling audio-processing subroutines, auto-detection, error concealment, etc.
- **Decoders** - Any Module that initially writes data into the audio I/O buffers, e.g. AC-3™, DTS, PCM, etc. All the decoding/processing algorithms listed require delivery of PCM or IEC61937-packed, compressed data via I^2S- or LJ-formatted digital audio to the CS4970x4 from A/D converters, SPDIF Rx, HDMI Rx, etc.
- **Matrix-processors** - Any module that processes audio I/O buffer PCM data in-place before the Post-processors. Generally speaking, these modules alter the number of valid channels in the audio I/O buffer through processes like Virtualization (n⇨2 channels) or Matrix Decoding (2⇨n channels). Examples are Dolby ProLogic IIx and DTS Neo:6.
- **Virtualizer-processor -** Any module that encodes PCM data into fewer output channels than input channels (n⇨2 channels) with the effect of providing “phantom” speakers to represent the physical audio channels that were eliminated. Examples are Dolby Headphone® 2 and Dolby Virtual Speaker® 2. Generally speaking, these modules reduce the number of valid channels in the audio I/O buffer.
- **Post-processors** - Any module that processes audio I/O buffer PCM data in-place after the Matrix-Processors. Examples are Bass Management, Audio Manager, Tone Control, EQ, Delay, Customer-specific Effects, Dolby Headphone/Virtual Speaker, etc.

The overlay structure reduces the time required to reconfigure the DSP when a processing change is requested. Each overlay can be reloaded independently without disturbing the other overlays. For example, when a new decoder is selected, the OS, matrix-, and post-processors do not need to be reloaded — only the new decoder (the same is true for the other overlays).

4. Hardware Functional Description

4.1 Coyote DSP Core

The CS4970x4 is a dual-core Coyote DSP with separate X and Y data and P code memory spaces. Each core is a high-performance, 32-bit, user-programmable, fixed-point DSP that is capable of performing two multiply accumulate (MAC) operations per clock cycle. Each core has eight 72-bit accumulators, four X- and four Y-data registers, and 12 index registers.

Both DSP cores are coupled to a flexible DMA engine. The DMA engine can move data between peripherals such as the digital audio input (DAI) and digital audio output (DAO), external memory, or any DSP core memory, all without the intervention of the DSP. The DMA engine offloads data move instructions from the DSP core, leaving more MIPS available for signal processing instructions.

CS4970x4 functionality is controlled by application codes that are stored in on-board ROM or downloaded to the CS4970x4 from a host MCU or external FLASH/EEPROM. Users can choose to use standard audio decoder and post-processor modules which are available from Cirrus Logic.

The CS4970x4 is suitable for Audio Decoder, Audio Post-processor, Audio Encoder, DVD Audio/Video Player, and Digital Broadcast Decoder applications.

4.1.1 DSP Memory

Each DSP core has its own on-chip data and program RAM and ROM and does not require external memory for any of today's popular audio algorithms including Dolby Digital Surround EX, AAC Multichannel, DTS-ES 96/24, and THX Ultra2. However, if the end-system design requires support of the new high-definition audio formats, external SDRAM will be needed to support Dolby TrueHD and DTS-HD Master Audio.

The memory maps for the DSPs are as follows. All memory sizes are composed of 32-bit words.

Table 3. CS4970x4 DSP Memory Sizes

Memory Type	DSP A	DSP B
X	16k SRAM, 32k ROM	10k SRAM, 8k ROM
Y	24k SRAM, 32k ROM	16k SRAM, 16k ROM
P	8k SRAM, 32k ROM	8k SRAM, 24k ROM

4.1.2 DMA Controller

The powerful 12-channel DMA controller can move data between 8 on-chip resources. Each resource has its own arbiter: X, Y, and P RAM/ROMs on DSP A; X, Y, and P RAM/ROMs on DSP B; external memory; and the peripheral bus. Modulo and linear addressing modes are supported, with flexible start address and increment controls. The service interval for each DMA channel as well as up to 6 interrupt events, is programmable.

4.2 On-chip DSP Peripherals

4.2.1 Digital Audio Input Port (DAI)

The 12-channel (6 line) DAI port supports a wide variety of data input formats. The port is capable of accepting PCM, IEC61937, or DSD. Up to 32-bit word lengths are supported. Up to 6 channels of DSD are supported and internally converted to PCM before processing. Additionally support is provided for audio data input to the DSP via the DAI from an HDMI receiver.

The port has two independent slave-only clock domains. Each data input can be independently assigned to a clock domain. The sample rate of the input clock domains can be determined automatically by the DSP, which off-loads the task of monitoring the SPDIF receiver from the host. A time-stamping feature allows the input data to be sample-rate converted via software.

4.2.2 Digital Audio Output Port (DAO)

There are two DAO ports. Each port can output 8 channels of up to 32-bit PCM data. The port supports data rates from 32 kHz to 192 kHz. Each port can be configured as an independent clock domain in slave mode, or the ratio of the two clocks can be set to even multiples of each other in master mode. The two ports can also be ganged together into a single clock domain. Each port has one serial audio pin that can be configured as a 192 kHz SPDIF transmitter (data with embedded clock on a single line).

4.2.3 Serial Control Port 1 & 2 (I^2C™ or SPI™)

There are two on-chip serial control ports that are capable of operating as master or slave in either I^2C or SPI modes. SCP1 defaults to slave operation. It is dedicated for external host-control and supports an external clock up to 50 MHz in SPI mode. This high clock speed enables very fast code download, control or data delivery. SCP2 defaults to master mode and is dedicated for booting from external serial Flash memory or for audio sub-system control.

4.2.4 Parallel Control Port

The CS4970x4 parallel port supports both Motorola® and Intel® interfaces. It can be used for both control and data delivery. The parallel port pins are multiplexed with serial control port 2 and are available in the 144-pin package.

4.2.5 External Memory Interface

The external memory interface controller supports up to 128 Mbits of SDRAM, using a 16-bit data bus.

4.2.6 GPIO

Many of the CS4970x4 peripheral pins are multiplexed with GPIO. Each GPIO can be configured as an output, an input, or an input with interrupt. Each input-pin interrupt can be configured as rising edge, falling edge, active-low, or active-high.

4.2.7 PLL-based Clock Generator

The low-jitter PLL generates integer or fractional multiples of a reference frequency which are used to clock the DSP core and peripherals. Through a second PLL divider chain, a dependent clock domain can be output on the DAO port for driving audio converters. The CS4970x4 defaults to running from the external reference frequency and can be switched to use the PLL output after overlays have been loaded and configured, either through master boot from an external FLASH or through host control. A built-in crystal oscillator circuit with a buffered output is provided. The buffered output frequency ratio is selectable between 1:1 (default) or 2:1.

4.3 DSP I/O Description

4.3.1 Multiplexed Pins

Many of the CS4970x4 pins are multi-functional. For details on pin functionality please refer to the *CS4970x4 System Designer's Guide.*

4.3.2 Termination Requirements

Open-drain pins on the CS4970x4 must be pulled high for proper operation. Please refer to the *CS4970x4 System Designer's Guide* to identify which pins are open-drain and what value of pull-up resistor is required for proper operation.

Mode select pins on the CS4970x4 are used to select the boot mode upon the rising edge of reset. A detailed explanation of termination requirements for each communication mode select pin can be found in the *CS4970x4 System Designer's Guide*.

4.3.3 Pads

The CS4970x4 I/O operate from the 3.3 V supply and are 5 V tolerant.

4.4 Application Code Security

The external program code may be encrypted by the programmer to protect any intellectual property it may contain. A secret, customer-specific key is used to encrypt the program code that is to be stored external to the device.

5. Characteristics and Specifications

Note: All data sheet minimum and maximum timing parameters are guaranteed over the rated voltage and temperature. All data sheet typical parameters are measured under the following conditions: T = 25 °C, C_L = 20 pF, VDD = 1.8 V, VDDA = VDDIO = 3.3 V, GNDD = GNDIO = GNDA = 0 V.

5.1 Absolute Maximum Ratings

(GNDD = GNDIO = GNDA = 0 V; all voltages with respect to 0 V)

Parameter	Symbol	Min	Max	Unit
DC power supplies: Core supply	VDD	–0.3	2.0	V
PLL supply	VDDA	–0.3	3.6	V
I/O supply	VDDIO	–0.3	3.6	V

1. The specification f_{spisck} indicates the maximum speed of the hardware. The system designer should be aware that the actual maximum speed of the communication port may be limited by the firmware application. Flow control using the SCP_BSY# pin should be implemented to prevent overflow of the input data buffer.At boot the maximum speed is Fxtal/3.

Bus free time between active SCP_CS#	t_{spicsx}		3*DCLKP	-	ns
SCP_CLK falling to SCP_MOSI output high-Z	t_{spidz}	-		20	ns

1. The specification f_{spisck} indicates the maximum speed of the hardware. The system designer should be aware that the actual maximum speed of the communication port may be limited by the firmware application.
2. See Section 5.8.
3. SCP_CLK PERIOD refers to the period of SCP_CLK as being used in a given application. It does not refer to a tested parameter.

SCP_CLK rising to SCB_BSY# low	$t_{iicbsyl}$	-	3∗DCLKP + 20		ns

1. The specification f_{iicck} indicates the maximum speed of the hardware. The system designer should be aware that the actual maximum speed of the communication port may be limited by the firmware application. Flow control using the SCP_BSY# pin should be implemented to prevent overflow of the input data buffer.

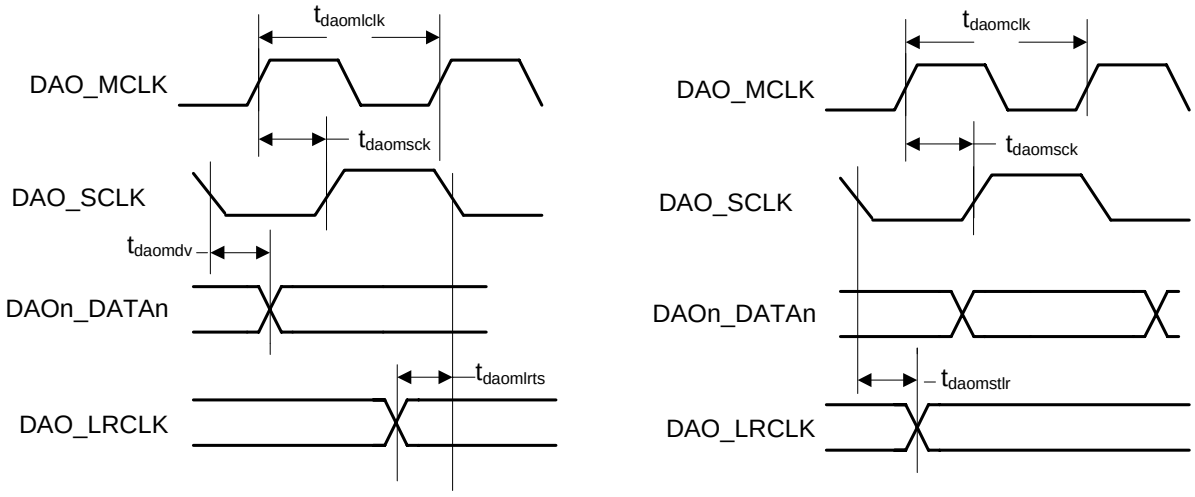
1. Master mode timing specifications are characterized, not production tested.
2. Master mode is defined as the CS4970x4 driving both DAO_SCLK, DAO_LRCLK. When MCLK is an input, it is divided to produce DAO_SCLK, DAO_LRCLK.
3. This timing parameter is defined from the non-active edge of DAO_SCLK. The active edge of DAO_SCLK is the point at which the data is valid.
4. Slave mode is defined as DAO_SCLK, DAO_LRCLK driven by an external source.



Note: In these diagrams, Falling edge is the inactive edge of DAO_SCLK

10. Revision History

Revision	Date	Changes
A1	FEB 2007	Advance Release.
PP1	MAY 2007	Removed Advanced Product watermark, corrected logo, and added “Preliminary Product Information” on first page and modified legal information to reflect Preliminary Product status.
PP2	JULY 2007	Added notice about status of DTS-HD license on page 1 and 7.
PP3	OCT 2007	Updated the Tspidsu, Tspickl, and Tspickh timing parameters for master mode SPI. This applies to both SPI ports. Removed DTS-HD license notice inserted in version PP2. The license for the DTS-HD decoder is now in place. Updated Pin Assignments in 144-Pin LQFP Pin-Out Diagram, removing EE_CS from Pin 7 and adding EE_CS to Pin 25.
PP4	December 20, 2007	Updated DAO timing specifications and timing diagrams. Changed product naming conventions in Table 4 and Table 5. Changed references to *CS4970x4 Hardware User’s Manual* to *CS4970x4 System Designer’s Guide.* Changed references to *CS4970x4 Firmware User’s Manual* to *CS4970x4 System Designer’s Guide*
PP5	May 28, 2008	Added 128-Pin LQFP Pin-Out and Package drawings. Changed part numbering in Section 6.and Section 7. Added device and firmware selection guide in Table 2.
PP6	August 4, 2008	Added typical crystal frequency values in Table Footnote 1 and the Max and Min values of F_{xtal} in Section 5.8. Removed DSD Phase Modulation Mode from Section 5.17. Removed reference to MCLK in Section 5.17. Redefined Master mode clock speed for SCP_CLK in Section 5.11. Redefined DC leakage characterization data in Section 5.3, correcting units of measurement. Modified Footnote 1 under Section 5.10. Changed product family numbering from CS497xx to CS4970x4. Corrected product listings in table under Section 5.9 “Switching Characteristics — Internal Clock” on page 13.
PP7	September 30, 2008	Removed references to External Parallel Flash / SRAM Interface.
PP8	November 6, 2009	Updated the feature descriptions on the first page of this data sheet. Removed references to UART port. Removed references to 11.2896, 18.432, and 27 MHz frequency clocks in Note 1 in Section 5.8 “Switching Characteristics — XTI” on page 12 and the Min and Max External Crystal Operating Frequency values in that same section. Added Section 5.6 “Thermal Data (128-pin LQFP)” on page 11. Updated Figure 9 and Figure 10. Updated Section 5.17 “Switching Characteristics — DSD“ Serial Input Port” on page 22. Updated Figure 15 and Figure 16. In Section 5.3, the parameter, “Input leakage current (all digital pins with internal pull-up resistors enabled, and XTI)”, Max value changes from 50 mA to 70 mA. In Section 5.13, the parameter SCP_CLK low to SCP_SDA out valid with symbol “tiicdov” Max value changes from 18 ns to 36 ns. Added CS497014 to Section 6. “Ordering Information” on page 28 and to Section 7. “Environmental, Manufacturing, and Handling Information” on page 28. Updated Table 2, “Device and Firmware Selection Guide,” on page 5.
