# 8-BIT CMOS MICROCONTROLLERS USER'S MANUAL 

## Revision 1.4

ELECTRONICS

## Important Notice

The information in this publication has been carefully checked and is believed to be entirely accurate at the time of publication. Samsung assumes no responsibility, however, for possible errors or omissions, or for any consequences resulting from the use of the information contained herein.

Samsung reserves the right to make changes in its products or product specifications with the intent to improve function or design at any time and without notice and is not required to update this documentation to reflect such changes.
This publication does not convey to a purchaser of semiconductor devices described herein any license under the patent rights of Samsung or others.

Samsung makes no warranty, representation, or guarantee regarding the suitability of its products for any particular purpose, nor does Samsung assume any liability arising out of the application or use of any product or circuit and specifically disclaims any and all liability, including without limitation any consequential or incidental damages.
"Typical" parameters can and do vary in different applications. All operating parameters, including "Typicals" must be validated for each customer application by the customer's technical experts.

Samsung products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, for other applications intended to support or sustain life, or for any other application in which the failure of the Samsung product could create a situation where personal injury or death may occur.
Should the Buyer purchase or use a Samsung product for any such unintended or unauthorized application, the Buyer shall indemnify and hold Samsung and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, expenses, and reasonable attorney fees arising out of, either directly or indirectly, any claim of personal injury or death that may be associated with such unintended or unauthorized use, even if such claim alleges that Samsung was negligent regarding the design or manufacture of said product.

## NOTIFICATION OF REVISIONS

ORIGINATOR:

## PRODUCT NAME:

DOCUMENT NAME: S3C828B/F828B/C8289/F8289/C8285/F8285 User's Manual, Revision 1.4

DOCUMENT NUMBER: 21.4-S3-C828B/F828B/C8289/F8289/C8285/F8285-052006

## EFFECTIVE DATE: May, 2006

## SUMMARY: As a result of additional product testing and evaluation, some specifications

 published in S3C828B/F828B/C8289/F8289/C8285/F8285 User's Manual, Revision 1.4, have been changed. These changes for in S3C828B/F828B/ C8289/F8289/C8285/F8285 microcontroller, which are described in detail in the Revision Descriptions section below, are related to the followings:- Chapter 7. Clock Circuit
- Chapter 20. Electrical Data

## DIRECTIONS:

Please note the changes in your copy (copies) of the S3C828B/F828B/C8289 /F8289/C8285/F8285 User's Manual, Revision 1.4. Or, simply attach the Revision Descriptions of the next page to S3C828B/F828B/C8289/F8289/C8285/F8285 User's Manual, Revision 1.4.

## REVISION HISTORY

| Revision | Date | Remark |
| :---: | :--- | :--- |
| 0 | February, 2005 | Preliminary Spec for internal release only. |
| 1 | April, 2005 | First edition. |
| 1.1 | June, 2005 | Second edition. |
| 1.2 | July, 2005 | Third edition. |
| 1.3 | September, 2005 | Fourth edition. |
| 1.4 | May, 2006 | Fifth edition. |

## REVISION DESCRIPTIONS

## 1. Chapter 7. Clock Circuit

The contents of OSCCON. 7 should be changed " $0=$ Select normal circuit for sub oscillator" into " $0=$ Initial state" in the Page 4-19, Figure 7-8.

It is added "NOTE: The OSCCON. 7 should be maintained to " 1 ", during the sub oscillator operation." In the Page 4-19, Figure 7-8.

## 2. Chapter 20. Electrical Data

Table 20-10. UART Timing Characteristics in Mode 0 (11.1MHz)
$\left(\mathrm{T}_{\mathrm{A}}=-25^{\circ} \mathrm{C}\right.$ to $+85^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=2.0 \mathrm{~V}$ to 3.6 V , Load Capacitance $\left.=80 \mathrm{pF}\right)$

| Parameter | Symbol | Min | Typ | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Serial port clock cycle time | $\mathrm{t}_{\mathrm{SCK}}$ | 1,250 | $\mathrm{t}_{\mathrm{CPU}} \times 16$ | 1,650 | ns |
| Output data setup to clock rising edge | $\mathrm{t}_{\mathrm{S} 1}$ | 590 | $\mathrm{t}_{\mathrm{CPU}} \times 13$ | - |  |
| Clock rising edge to input data valid | $\mathrm{t}_{\mathrm{S} 2}$ | - | - | 590 |  |
| Output data hold after clock rising edge | $\mathrm{t}_{\mathrm{H} 1}$ | $\mathrm{t}_{\mathrm{CPU}}-50$ | $\mathrm{t}_{\mathrm{CPU}}$ | - |  |
| Input data hold after clock rising edge | $\mathrm{t}_{\mathrm{H} 2}$ | 0 | - | - |  |
| Serial port clock High, Low level width | $\mathrm{t}_{\mathrm{HIGH},} \mathrm{t}_{\mathrm{LOW}}$ | 470 | $\mathrm{t}_{\mathrm{CPU}} \times 8$ | 970 |  |

## Preface

The S3C828B/F828B/C8289/F8289/C8285/F8285 Microcontroller User's Manual is designed for application designers and programmers who are using the S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller for application development. It is organized in two main parts:
Part I Programming Model Part II Hardware Descriptions
Part I contains software-related information to familiarize you with the microcontroller's architecture, programming model, instruction set, and interrupt structure. It has six chapters:

| Chapter 1 | Product Overview | Chapter 4 | Control Registers |
| :--- | :--- | :--- | :--- |
| Chapter 2 | Address Spaces | Chapter 5 | Interrupt Structure |
| Chapter 3 | Addressing Modes | Chapter 6 | Instruction Set |

Chapter 1, "Product Overview," is a high-level introduction to S3C828B/F828B/C8289/F8289/C8285/F8285 with general product descriptions, as well as detailed information about individual pin characteristics and pin circuit types.
Chapter 2, "Address Spaces," describes program and data memory spaces, the internal register file, and register addressing. Chapter 2 also describes working register addressing, as well as system stack and user-defined stack operations.
Chapter 3, "Addressing Modes," contains detailed descriptions of the addressing modes that are supported by the S3C8-series CPU.

Chapter 4, "Control Registers," contains overview tables for all mapped system and peripheral control register values, as well as detailed one-page descriptions in a standardized format. You can use these easy-to-read, alphabetically organized, register descriptions as a quick-reference source when writing programs.
Chapter 5, "Interrupt Structure," describes the S3C828B/F828B/C8289/F8289/C8285/F8285 interrupt structure in detail and further prepares you for additional information presented in the individual hardware module descriptions in Part II.
Chapter 6, "Instruction Set," describes the features and conventions of the instruction set used for all S3C8-series microcontrollers. Several summary tables are presented for orientation and reference. Detailed descriptions of each instruction are presented in a standard format. Each instruction description includes one or more practical examples of how to use the instruction when writing an application program.
A basic familiarity with the information in Part I will help you to understand the hardware module descriptions in Part II. If you are not yet familiar with the S3C8-series microcontroller family and are reading this manual for the first time, we recommend that you first read Chapters 1-3 carefully. Then, briefly look over the detailed information in Chapters 4, 5, and 6. Later, you can reference the information in Part I as necessary.

Part II "hardware Descriptions," has detailed information about specific hardware components of the S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller. Also included in Part II are electrical, mechanical, Flash, and development tools data. It has 17 chapters:

| Chapter 7 | Clock Circuit | Chapter 16 | Serial I/O Interface |
| :--- | :--- | :--- | :--- |
| Chapter 8 | RESET and Power-Down | Chapter 17 | UART |
| Chapter 9 | I/O Ports | Chapter 18 | Battery Level Detector |
| Chapter 10 | Basic Timer | Chapter 19 | Embedded Flash Memory |
| Chapter 11 | 8-bit Timer A/B | Chapter 20 | Electrical Data |
| Chapter 12 | 16-bit Timer 0/1 | Chapter 21 | Mechanical Data |
| Chapter 13 | Watch Timer | Chapter 22 | S3F828B/F8289/F8285 Flash MCU |
| Chapter 14 | LCD Controller/Driver | Chapter 23 | Development Tools |
| Chapter 15 | 10-bit-to-Digital Converter |  |  |

Chapter 15 10-bit-to-Digital Converter

Chapter 16 Serial I/O Interface
Chapter 17 UART
Chapter 18 Battery Level Detector
Chapter 19 Embedded Flash Memory
Chapter 20 Electrical Data
Chapter 21 Mechanical Data
Chapter 23 Development Tools

Two order forms are included at the back of this manual to facilitate customer order for S3C828B/F828B/C8289/ F8289/C8285/F8285 microcontrollers: the Mask ROM Order Form, and the Mask Option Selection Form. You can photocopy these forms, fill them out, and then forward them to your local Samsung Sales Representative.

## Table of Contents

## Part I — Programming Model

Chapter 1 Product Overview
S3C8-Series Microcontrollers ..... 1-1
S3C828B/F828B/C8289/F8289/C8285/F8285 Microcontroller. ..... 1-1
Flash ..... 1-1
Features ..... 1-2
Block Diagram ..... 1-4
Pin Assignment ..... 1-5
Pin Descriptions ..... 1-7
Pin Circuits ..... 1-9
Chapter 2 Address Spaces
Overview ..... 2-1
Program Memory (ROM) ..... 2-2
Smart Option ..... 2-3
Register Architecture ..... 2-4
Register Page Pointer (PP) ..... 2-9
Register Set 1 ..... 2-11
Register Set 2 ..... 2-11
Prime Register Space ..... 2-12
Working Registers ..... 2-13
Using The Register Points ..... 2-14
Register Addressing ..... 2-16
Common Working Register Area (COH-CFH) ..... 2-18
4-Bit Working Register Addressing ..... 2-19
8-Bit Working Register Addressing ..... 2-21
System and User Stack ..... 2-23

## Table of Contents (Continued)

## Chapter 3 Addressing Modes

Overview ..... 3-1
Register Addressing Mode (R) ..... 3-2
Indirect Register Addressing Mode (IR) ..... 3-3
Indexed Addressing Mode (X) ..... 3-7
Direct Address Mode (DA) ..... 3-10
Indirect Address Mode (IA) ..... 3-12
Relative Address Mode (RA) ..... 3-13
Immediate Mode (IM) ..... 3-14
Chapter 4 Control Registers
Overview ..... 4-1
Chapter 5 Interrupt Structure
Overview ..... 5-1
Interrupt Types ..... 5-2
S3C828B/C8289/C8285 Interrupt Structure ..... 5-3
Interrupt Vector Addresses ..... 5-5
Enable/Disable Interrupt Instructions (EI, DI) ..... 5-7
System-Level Interrupt Control Registers ..... 5-7
Interrupt Processing Control Points ..... 5-8
Peripheral Interrupt Control Registers ..... 5-9
System Mode Register (SYM) ..... 5-10
Interrupt Mask Register (IMR) ..... 5-11
Interrupt Priority Register (IPR) ..... 5-12
Interrupt Request Register (IRQ) ..... 5-14
Interrupt Pending Function Types ..... 5-15
Interrupt Source Polling Sequence ..... 5-16
Interrupt Service Routines ..... 5-16
Generating Interrupt Vector Addresses ..... 5-17
Nesting Of Vectored Interrupts ..... 5-17
Instruction Pointer (IP) ..... 5-17
Fast Interrupt Processing ..... 5-17
Chapter 6 Instruction Set
Overview ..... 6-1
Data Types ..... 6-1
Register Addressing ..... 6-1
Addressing Modes ..... 6-1
Flags Register (FLAGS) ..... 6-6
Flag Descriptions ..... 6-7
Instruction Set Notation ..... 6-8
Condition Codes ..... 6-12
Instruction Descriptions ..... 6-13

## Table of Contents (Continued)

## Part II Hardware Descriptions

Chapter $7 \quad$ Clock Circuit
Overview ..... 7-1
System Clock Circuit ..... 7-1
Main Oscillator Circuits ..... 7-2
Sub Oscillator Circuits ..... 7-2
Clock Status During Power-Down Modes ..... 7-3
System Clock Control Register (CLKCON) ..... 7-4
Oscillator Control Register (OSCCON) ..... 7-5
Switching the CPU Clock ..... 7-6
Chapter 8 RESET and Power-Down
System RESET ..... 8-1
Overview ..... 8-1
Normal Mode RESET Operation ..... 8-1
Hardware RESET Values ..... 8-2
Power-Down Modes ..... 8-5
Stop Mode ..... 8-5
Idle Mode ..... 8-6
Chapter 9 I/O Ports
Overview ..... 9-1
Port Data Registers ..... 9-2
Port 0 ..... 9-3
Port 1 ..... 9-7
Port 2 ..... 9-9
Port 3 ..... 9-11
Port 4 ..... 9-13
Port 5 ..... 9-15
Port 6 ..... 9-17
Port 7 ..... 9-19
Port 8 ..... 9-20
Chapter 10 Basic Timer
Overview ..... 10-1
Basic Timer (BT) ..... 10-1
Basic Timer Control Register (BTCON) ..... 10-1
Basic Timer Function Description ..... 10-3

## Table of Contents (Continued)

Chapter 11 8-bit Timer A/B
8-Bit Timer A ..... 11-1
Overview ..... 11-1
Timer A Control Register (TACON) ..... 11-2
Timer A Function Description ..... 11-3
Block Diagram ..... 11-6
8-Bit Timer B ..... 11-7
Overview ..... 11-7
Block Diagram ..... 11-8
Timer B Pulse Width Calculations ..... 11-9
Chapter 12 16-bit Timer 0/1
16-Bit Timer 0 ..... 12-1
Overview ..... 12-1
Function Description ..... 12-1
Timer 0 Control Register (TOCON) ..... 12-2
Block Diagram ..... 12-3
16-Bit Timer 1 ..... 12-4
Overview ..... 12-4
Timer 1 Control Register (T1CON) ..... 12-5
Timer 1 Function Description ..... 12-6
Block Diagram ..... 12-9
Chapter 13 Watch Timer
Overview ..... 13-1
Watch Timer Control Register (WTCON) ..... 13-2
Watch Timer Circuit Diagram ..... 13-3
Chapter 14 LCD Controller/Driver
Overview ..... 14-1
LCD Circuit Diagram ..... 14-2
LCD RAM Address Area ..... 14-3
LCD Control Register (LCON) ..... 14-4
LCD Voltage Dividing Resistor ..... 14-5
Common (COM) Signals ..... 14-6
Segment (SEG) Signals . ..... 14-6

## Table of Contents (Continued)

## Chapter 15 10-bit Analog-to-Digital Converter

Overview ..... 15-1
Function Description ..... 15-1
Conversion Timing ..... 15-2
A/D Converter Control Register (ADCON) ..... 15-2
Internal Reference Voltage Levels ..... 15-3
Block Diagram ..... 15-4
Chapter 16 Serial I/O Interface
Overview ..... 16-1
Programming Procedure ..... 16-1
SIO Control Register (SIOCON) ..... 16-2
SIO PRe-Scaler Register (SIOPS) ..... 16-3
Block Diagram ..... 16-3
Serial I/O Timing Diagram ..... 16-4
Chapter 17 UART
Overview ..... 17-1
Programming Procedure ..... 17-1
UART Control Register (UARTCON) ..... 17-2
UART Interrupt Pending Bits ..... 17-3
UART Data Register (UDATA) ..... 17-4
UART Baud Rate Data Register (BRDATA) ..... 17-4
BAUD Rate Calculations ..... 17-4
Block Diagram ..... 17-6
UART Mode 0 Function Description ..... 17-7
Serial Port Mode 1 Function Description ..... 17-8
Serial Port Mode 2 Function Description ..... 17-9
Serial Port Mode 3 Function Description ..... 17-10
Serial Communication for Multiprocessor Configurations ..... 17-11
Chapter 18 Battery Level Detector
Overview ..... 18-1
Battery Level Detector Control Register (BLDCON) ..... 18-2

## Table of Contents (Concluded)

## Chapter 19 Embedded Flash Memory Interface

Overview ..... 19-1
User Program Mode ..... 19-2
Flash Memory Control Registers (User Program Mode) ..... 19-3
Flash Memory Control Register ..... 19-3
Flash Memory User Programming Enable Register ..... 19-4
Flash Memory Sector Address Registers ..... 19-5
ISP ${ }^{\text {TM }}$ (On-Board Programming) Sector ..... 19-6
ISP Reset Vector and ISP Sector Size ..... 19-7
Sector Erase ..... 19-8
The Sector Program Procedure in User Program Mode ..... 19-9
Programming ..... 19-10
The Program Procedure in User Program Mode ..... 19-10
Reading ..... 19-11
The Program Procedure in User Program Mode ..... 19-11
Hard Lock Protection ..... 19-12
The Program Procedure in User Program Mode ..... 19-12
Chapter 20 Electrical Data
Overview ..... 20-1
Chapter 21 Mechanical Data
Overview ..... 21-1
Chapter 22 S3F828B/F8289/F8285 Flash MCU
Overview ..... 22-1
Operating Mode Characteristics ..... 22-5
Chapter 23 Development Tools
Overview ..... 23-1
SHINE ..... 23-1
SAMA Assembler ..... 23-1
SASM88 ..... 23-1
HEX2ROM ..... 23-1
Target Boards ..... 23-1
TB828B/9/5 Target Board ..... 23-3
SMDS2+ Selection (SAM8) ..... 23-5
Idle LED ..... 23-5
Stop LED ..... 23-5

PRODUCT OVERVIEW

## S3C8-SERIES MICROCONTROLLERS

Samsung's S3C8 series of 8-bit single-chip CMOS microcontrollers offers a fast and efficient CPU, a wide range of integrated peripherals, and various mask-programmable ROM sizes. Among the major CPU features are:

- Efficient register-oriented architecture
- Selectable CPU clock sources
- Idle and Stop power-down mode release by interrupts
- Built-in basic timer with watchdog function

A sophisticated interrupt structure recognizes up to eight interrupt levels. Each level can have one or more interrupt sources and vectors. Fast interrupt processing (within a minimum of four CPU clocks) can be assigned to specific interrupt levels.

## S3C828B/F828B/C8289/F8289/C8285/F8285 MICROCONTROLLER

The S3C828B/F828B/C8289/F8289/C8285/F8285 single-chip CMOS microcontroller are fabricated using the highly advanced CMOS process, based on Samsung's newest CPU architecture.

The S3C828B, S3C8289, S3C8285 are a microcontroller with a 64K-byte, 32K-byte, 16K-byte mask-programmable ROM embedded respectively.

The S3F828B is a microcontroller with a 64K-byte Flash ROM embedded.
The S3F8289 is a microcontroller with a 32K-byte Flash ROM embedded.
The S3F8285 is a microcontroller with a 16K-byte Flash ROM embedded.

Using a proven modular design approach, Samsung engineers have successfully developed the S3C828B/F828B/C8289/F8289/C8285/F8285 by integrating the following peripheral modules with the powerful SAM8 core:

- Nine programmable I/O ports, including six 8-bit ports, and one 7 -bit port, one 6-bit port, one 4-bit port, for a total of 65 pins.
- Eight bit-programmable pins for external interrupts.
- One 8-bit basic timer for oscillation stabilization and watchdog functions (system reset).
- Two 8-bit timer/counter and two 16-bit timer/counter with selectable operating modes.
- Watch timer for real time.
- LCD Controller/driver
- A/D converter with 8 selectable input pins
- Synchronous SIO modules

The S3C828B/F828B/C8289/F8289/C8285/F8285 is versatile microcontroller for camera, LCD and ADC application, etc. They are currently available in 80pin TQFP and 80-pin QFP package

## FLASH

The S3F828B/F8289/F8285 are FLASH version of the S3C828B/C8289/C8285 microcontroller. The S3F828B microcontroller has an on-chip FLASH ROM instead of a masked ROM. The S3F828B/F8289/F8285 is comparable to the S3C828B/C8289/C8285, both in function and in pin configuration. The S3F828B only is a full flash. The full flash means that data can be written into the program ROM by an instruction.

## FEATURES

## CPU

- SAM88 RC CPU core

## Memory

- Program Memory (ROM)
- $64 \mathrm{~K} \times 8$ bits program memory
(S3C828B/F828B)
- $32 \mathrm{~K} \times 8$ bits program memory (S3C8289/F8289)
$-16 \mathrm{~K} \times 8$ bits program memory (S3C8285/F8285)
- Internal flash memory (program memory)
$\sqrt{ }$ Sector size: 128 bytes
$\sqrt{ } 10$ years data retention
$\sqrt{ }$ Fast programming time:
+ chip erase: 50 ms
+ sector erase: 10 ms
+ byte program: $30 \mu \mathrm{~s}$
$\sqrt{ }$ User programmable by 'LDC' instruction
$\sqrt{ }$ Endurance: 10,000 erase/program cycles
$\sqrt{ }$ Sector (128 bytes) erase available
$\sqrt{ }$ Byte programmable
$\sqrt{ }$ External serial programming support
$\sqrt{ }$ Expandable OBPTM (on board program) sector
- Data Memory (RAM)
- Including LCD display data memory
$-2614 \times 8$ bits data memory (S3C828B/F828B)
$-1078 \times 8$ bits data memory (S3C8289/F8289)
$-566 \times 8$ bits data memory (S3C8285/F8285)

## Instruction Set

- 78 instructions
- Idle and stop instructions added for power-down modes

## 65 I/O Pins

- I/O: 25 pins
- I/O: 40 pins (Sharing with LCD signal outputs)

## Interrupts

- 8 interrupt levels and 18 interrupt sources
- Fast interrupt processing feature

## 8-Bit Basic Timer

- Watchdog timer function
- 4 kinds of clock source

## 8-Bit Timer/Counter A

- Programmable 8-bit internal timer
- External event counter function
- PWM and capture function

## 8-Bit Timer/Counter B

- Programmable 8-bit internal timer
- Carrier frequency generator

## 16-Bit Timer/Counter 0

- Programmable 16-bit internal timer

## 16-Bit Timer/Counter 1

- Programmable 16-bit internal timer
- External event counter function
- PWM and capture function

## Watch Timer

- Interval time: $3.91 \mathrm{mS}, 0.25 \mathrm{~S}, 0.5 \mathrm{~S}$, and 1 S at 32.768 kHz
- $0.5 / 1 / 2 / 4 \mathrm{kHz}$ Selectable buzzer output

## LCD Controller/Driver

- 32 segments and 8 common terminals
- $1 / 2,1 / 3,1 / 4$, and $1 / 8$ duty selectable
- Internal resistor circuit for LCD bias

## Analog to Digital Converter

- 8-channel analog input
- 10-bit conversion resolution
- 25uS conversion time

## UART

- Full-duplex serial I/O interface
- Four programmable operating modes

## 8-bit Serial I/O Interface

- 8-bit transmit/receive mode
- 8-bit receive mode
- LSB-first or MSB-first transmission selectable
- Internal or External clock source

## FEATURES (Continued)

## Battery Level Detector

- 3-creteria voltage selectable ( $2.2 \mathrm{~V}, 2.4 \mathrm{~V}, 2.8 \mathrm{~V}$ )
- En/Disable by software for current consumption

## Low Voltage Reset (LVR)

- Criteria voltage: 2.2 V
- En/Disable by smart option (ROM address: 3FH)

## Two Power-Down Modes

- Idle: only CPU clock stops
- Stop: selected system clock and CPU clock stop

## Oscillation Sources

- Crystal, ceramic, or RC for main clock
- Main clock frequency: $0.4 \mathrm{MHz}-11.1 \mathrm{MHz}$
- $\quad 32.768 \mathrm{kHz}$ crystal oscillation circuit for sub clock

## Instruction Execution Times

- 360 nS at 11.1 MHz fx (minimum)

## Operating Voltage Range

- 2.0 V to 3.6 V at $0.4-4.2 \mathrm{MHz}$
- 2.7 V to 3.6 V at $0.4-10.0 \mathrm{MHz}$
- 3.0 V to 3.6 V at $0.4-11.1 \mathrm{MHz}$

## Operating Temperature Range

- $-25^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

## Package Type

- 80-QFP-1420C, 80-TQFP-1212

## Smart Option

- Low Voltage Reset (LVR) level and enable/disable are at your hardwired option (ROM address 3FH)
- ISP related option selectable (ROM address 3EH)

## BLOCK DIAGRAM

Figure 1-1. Block Diagram

## PIN ASSIGNMENT

Figure 1-2. S3C828B/F828B/C8289/F8289/C8285/F8285 Pin Assignments (80-QFP-1420C)

NOTE: The sequence of pins in TQFP package is disagreement with that in QFP package.

Figure 1-3. S3C828B/F828B/C8289/F8289/C8285/F8285 Pin Assignments (80-TQFP-1212)

## ADDRESS SPACES

## OVERVIEW

The S3C828B/C8289/C8285 microcontroller has two types of address space:

- Internal program memory (ROM)
- Internal register file

A 16-bit address bus supports program memory operations. A separate 8-bit register bus carries addresses and data between the CPU and the register file.

The S3C828B has an internal 64-Kbyte mask-programmable ROM. The S3C8289 has an internal 32-Kbyte mask-programmable ROM. The S3C8285 has an internal 16-Kbyte mask-programmable ROM.

The 256-byte physical register space is expanded into an addressable area of 320 bytes using addressing modes.

A 38-byte LCD display register file is implemented.

## PROGRAM MEMORY (ROM)

Program memory (ROM) stores program codes or table data. The S3C828B/F828B has 64K bytes internal maskprogrammable program memory, the S3C8289/F8289 has 32K bytes and the S3C8285/F8285 has 16K bytes.

The first 256 bytes of the ROM ( $0 \mathrm{H}-0 \mathrm{FFH}$ ) are reserved for interrupt vector addresses. Unused locations in this address range can be used as normal program memory. If you use the vector address area to store a program code, be careful not to overwrite the vector addresses stored in these locations.

The ROM address at which a program execution starts after a reset is 0100H in the S3C828B/C8289/C8285.
The reset address of ROM can be changed by a smart option only in the S3F828B(Full-Flash Device). Refer to the chapter 19. Embedded Flash Memory Interface for more detail contents.

Figure 2-1. Program Memory Address Space

## SMART OPTION

Figure 2-2. Smart Option

## REGISTER ARCHITECTURE

In the S3C828B/F828B/C8289/F8289/C8285/F8285 implementation, the upper 64-byte area of register files is expanded two 64-byte areas, called set 1 and set 2 . The upper 32-byte area of set 1 is further expanded two 32byte register banks (bank 0 and bank 1), and the lower 32-byte area is a single 32-byte common area.

In case of S3C828B/F828B the total number of addressable 8 -bit registers is 2,695. Of these 2,695 registers, 13 bytes are for CPU and system control registers, 38 bytes are for LCD data registers, 68 bytes are for peripheral control and data registers, 16 bytes are used as a shared working registers, and 2,560 registers are for generalpurpose use, page 0-page 9 (in case of S3C8289/F8289, page 0-page 3 and S3C8285/F8285, page0-page1).

You can always address set 1 register locations, regardless of which of the ten register pages is currently selected. Set 1 locations, however, can only be addressed using register addressing modes.

The extension of register space into separately addressable areas (sets, banks, and pages) is supported by various addressing mode restrictions, the select bank instructions, SB0 and SB1, and the register page pointer (PP).

Specific register types and the area (in bytes) that they occupy in the register file are summarized in Table 2-1.

Table 2-1. S3C828B/F828B Register Type Summary

| Register Type | Number of Bytes |
| :--- | :---: |
| General-purpose registers (including the 16-byte | 2,576 |
| common working register area, ten 192-byte prime |  |
| register area, and ten 64-byte set 2 area) | 38 |
| LCD data registers | 13 |
| CPU and system control registers | 68 |
| Mapped clock, peripheral, I/O control, and data registers | 2,695 |
| Total Addressable Bytes |  |

Table 2-2. S3C8289/F8289 Register Type Summary

| Register Type | Number of Bytes |
| :--- | :---: |
| General-purpose registers (including the 16-byte | 1,040 |
| common working register area, four 192-byte prime |  |
| register area, and four 64-byte set 2 area) | 38 |
| LCD data registers | 13 |
| CPU and system control registers | 68 |
| Mapped clock, peripheral, I/O control, and data registers | 1,159 |
| Total Addressable Bytes |  |

Table 2-3. S3C8285/F8285 Register Type Summary

| Register Type | Number of Bytes |
| :--- | :---: |
| General-purpose registers (including the 16-byte | 528 |
| common working register area, two 192-byte prime |  |
| register area, and two 64-byte set 2 area) | 38 |
| LCD data registers | 13 |
| CPU and system control registers | 68 |
| Mapped clock, peripheral, I/O control, and data registers | 647 |
| Total Addressable Bytes |  |

Figure 2-4. Internal Register File Organization (S3C8289/F8289)

Figure 2-5. Internal Register File Organization (S3C8285/F8285)

## REGISTER PAGE POINTER (PP)

The S3C8-series architecture supports the logical expansion of the physical 256-byte internal register file (using an 8 -bit data bus) into as many as 16 separately addressable register pages. Page addressing is controlled by the register page pointer (PP, DFH). In the S3C828B/C8289/C8285 microcontroller, a paged register file expansion is implemented for LCD data registers, and the register page pointer must be changed to address other pages.

After a reset, the page pointer's source value (lower nibble) and the destination value (upper nibble) are always "0000", automatically selecting page 0 as the source and destination page for register addressing.

Figure 2-6. Register Page Pointer (PP)

```

\hline & CLR & @R0 & \(\mathrm{RO}=00 \mathrm{H}\) & \\
\hline
\end{tabular}
```

NOTE: You should refer to page 6-39 and use DJNZ instruction properly when DJNZ instruction is used in your program.

## REGISTER SET 1

The term set 1 refers to the upper 64 bytes of the register file, locations $\mathrm{COH}-\mathrm{FFH}$.
The upper 32-byte area of this 64-byte space (EOH-FFH) is expanded two 32-byte register banks, bank 0 and bank 1. The set register bank instructions, SB0 or SB1, are used to address one bank or the other. A hardware reset operation always selects bank 0 addressing.

The upper two 32-byte areas (bank 0 and bank 1) of set 1 (EOH-FFH) contains 68 mapped system and peripheral control registers. The lower 32-byte area contains 16 system registers ( $\mathrm{DOH}-\mathrm{DFH}$ ) and a 16-byte common working register area ( $\mathrm{COH}-\mathrm{CFH}$ ). You can use the common working register area as a "scratch" area for data operations being performed in other areas of the register file.

Registers in set 1 locations are directly accessible at all times using Register addressing mode. The 16-byte working register area can only be accessed using working register addressing (For more information about working register addressing, please refer to Chapter 3, "Addressing Modes.")

## REGISTER SET 2

The same 64-byte physical space that is used for set 1 locations COH-FFH is logically duplicated to add another 64 bytes of register space. This expanded area of the register file is called set 2. For the S3C828B, the set 2 address range ( $\mathrm{COH}-\mathrm{FFH}$ ) is accessible on pages 0-9.
S3C8289, the set 2 address range (COH-FFH) is accessible on pages 0-3.
S3C8285, the set 2 address range ( $\mathrm{COH}-\mathrm{FFH}$ ) is accessible on pages 0-1.
The logical division of set 1 and set 2 is maintained by means of addressing mode restrictions. You can use only Register addressing mode to access set 1 location. In order to access registers in set 2, you must use Register Indirect addressing mode or Indexed addressing mode.

The set 2 register area is commonly used for stack operations.

## PRIME REGISTER SPACE

The lower 192 bytes (00H-BFH) of the S3C828B/C8289/C8285's ten or four or two 256-byte register pages is called prime register area. Prime registers can be accessed using any of the seven addressing modes (see Chapter 3, "Addressing Modes.")

The prime register area on page 0 is immediately addressable following a reset. In order to address prime registers on pages $0,1,2,3,4,5,6,7,8,9$, or 15 you must set the register page pointer (PP) to the appropriate source and destination values.

Figure 2-7. Set 1, Set 2, Prime Area Register, and LCD Data Register Map

## WORKING REGISTERS

Instructions can access specific 8-bit registers or 16-bit register pairs using either 4-bit or 8-bit address fields. When 4 -bit working register addressing is used, the 256 -byte register file can be seen by the programmer as one that consists of 328 -byte register groups or "slices." Each slice comprises of eight 8-bit registers.

Using the two 8-bit register pointers, RP1 and RP0, two working register slices can be selected at any one time to form a 16-byte working register block. Using the register pointers, you can move this 16-byte register block anywhere in the addressable register file, except the set 2 area.

The terms slice and block are used in this manual to help you visualize the size and relative locations of selected working register spaces:

- One working register slice is 8 bytes (eight 8 -bit working registers, R0-R7 or R8-R15)
- One working register block is 16 bytes (sixteen 8-bit working registers, R0-R15)

All the registers in an 8-byte working register slice have the same binary value for their five most significant address bits. This makes it possible for each register pointer to point to one of the 24 slices in the register file. The base addresses for the two selected 8-byte register slices are contained in register pointers RP0 and RP1.

After a reset, RP0 and RP1 always point to the 16-byte common area in set 1 ( $\mathrm{COH}-\mathrm{CFH}$ ).

Figure 2-8. 8-Byte Working Register Areas (Slices)

## USING THE REGISTER POINTS

Register pointers RP0 and RP1, mapped to addresses D6H and D7H in set 1, are used to select two movable 8 -byte working register slices in the register file. After a reset, they point to the working register common area: RP0 points to addresses $\mathrm{COH}-\mathrm{C} 7 \mathrm{H}$, and RP 1 points to addresses $\mathrm{C} 8 \mathrm{H}-\mathrm{CFH}$.

To change a register pointer value, you load a new value to RP0 and/or RP1 using an SRP or LD instruction. (see Figures 2-9 and 2-10).

With working register addressing, you can only access those two 8-bit slices of the register file that are currently pointed to by RP0 and RP1. You cannot, however, use the register pointers to select a working register space in set 2, COH-FFH, because these locations can be accessed only using the Indirect Register or Indexed addressing modes.

The selected 16 -byte working register block usually consists of two contiguous 8 -byte slices. As a general programming guideline, it is recommended that RP0 point to the "lower" slice and RP1 point to the "upper" slice (see Figure 2-9). In some cases, it may be necessary to define working register areas in different (noncontiguous) areas of the register file. In Figure 2-10, RP0 points to the "upper" slice and RP1 to the "lower" slice.

Because a register pointer can point to either of the two 8-byte slices in the working register block, you can flexibly define the working register area to support program requirements.

## PROGRAMMING TIP - Setting the Register Pointers

| SRP | \#70H | $; R P 0 \leftarrow 70 \mathrm{H}, \mathrm{RP} 1 \leftarrow 78 \mathrm{H}$ |
| :--- | :--- | :--- |
| SRP1 | \#48H | $; R P 0 \leftarrow$ no change, RP1 $\leftarrow 48 \mathrm{H}$, |
| SRP0 | \#0A0H | $; R P 0 \leftarrow$ A0H, RP1 $\leftarrow$ no change |
| CLR | RP0 | $; R P 0 \leftarrow 00 \mathrm{H}, \mathrm{RP} 1 \leftarrow$ no change |
| LD | RP1,\#0F8H | $; R P 0 \leftarrow$ no change, RP1 $\leftarrow 0$ F8H |

Figure 2-9. Contiguous 16-Byte Working Register Block

Figure 2-10. Non-Contiguous 16-Byte Working Register Block

## PROGRAMMING TIP — Using the RPs to Calculate the Sum of a Series of Registers

Calculate the sum of registers $80 \mathrm{H}-85 \mathrm{H}$ using the register pointer. The register addresses from 80 H through 85 H contain the values $10 \mathrm{H}, 11 \mathrm{H}, 12 \mathrm{H}, 13 \mathrm{H}, 14 \mathrm{H}$, and 15 H , respectively:

| SRP0 | \#80H | RP0 | $\leftarrow$ | 80H |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADD | R0,R1 | R0 | $\leftarrow$ | R0 | + | R1 |
| ADC | R0,R2 | R0 | $\leftarrow$ | R0 | + | $\mathrm{R} 2+\mathrm{C}$ |
| ADC | R0,R3 | R0 | $\leftarrow$ | R0 | + | R3 + C |
| ADC | R0,R4 | R0 | $\leftarrow$ | R0 | + | R4 + C |
| ADC | R0,R5 | R0 | $\leftarrow$ | R0 | $+$ | R5 + C |

The sum of these six registers, 6 FH , is located in the register $\mathrm{RO}(80 \mathrm{H})$. The instruction string used in this example takes 12 bytes of instruction code and its execution time is 36 cycles. If the register pointer is not used to calculate the sum of these registers, the following instruction sequence would have to be used:

| ADD | $80 \mathrm{H}, 81 \mathrm{H}$ | $; 80 \mathrm{H} \leftarrow(80 \mathrm{H})+(81 \mathrm{H})$ |
| :--- | :--- | :--- | :--- |
| ADC | $80 \mathrm{H}, 82 \mathrm{H}$ | $; 80 \mathrm{H} \leftarrow(80 \mathrm{H})+(82 \mathrm{H})+\mathrm{C}$ |
| ADC | $80 \mathrm{H}, 83 \mathrm{H}$ | $; 80 \mathrm{H} \leftarrow(80 \mathrm{H})+(83 \mathrm{H})+\mathrm{C}$ |
| ADC | $80 \mathrm{H}, 84 \mathrm{H}$ | $; 80 \mathrm{H} \leftarrow(80 \mathrm{H})+(84 \mathrm{H})+\mathrm{C}$ |
| ADC | $80 \mathrm{H}, 85 \mathrm{H}$ | $; 80 \mathrm{H} \leftarrow(80 \mathrm{H})+(85 \mathrm{H})+\mathrm{C}$ |

Now, the sum of the six registers is also located in register 80 H . However, this instruction string takes 15 bytes of instruction code rather than 12 bytes, and its execution time is 50 cycles rather than 36 cycles.

## REGISTER ADDRESSING

The S3C8-series register architecture provides an efficient method of working register addressing that takes full advantage of shorter instruction formats to reduce execution time.

With Register $(\mathrm{R})$ addressing mode, in which the operand value is the content of a specific register or register pair, you can access any location in the register file except for set 2 . With working register addressing, you use a register pointer to specify an 8-byte working register space in the register file and an 8-bit register within that space.

Registers are addressed either as a single 8-bit register or as a paired 16-bit register space. In a 16-bit register pair, the address of the first 8-bit register is always an even number and the address of the next register is always an odd number. The most significant byte of the 16 -bit data is always stored in the even-numbered register, and the least significant byte is always stored in the next (+1) odd-numbered register.

Working register addressing differs from Register addressing as it uses a register pointer to identify a specific 8 -byte working register space in the internal register file and a specific 8-bit register within that space.

Figure 2-11. 16-Bit Register Pair

Figure 2-12. Register File Addressing

## COMMON WORKING REGISTER AREA (COH-CFH)

After a reset, register pointers RP0 and RP1 automatically select two 8-byte register slices in set 1, locations $\mathrm{COH}-\mathrm{CFH}$, as the active 16 -byte working register block:

$$
\begin{aligned}
& \mathrm{RPO} \rightarrow \mathrm{COH}-\mathrm{C} 7 \mathrm{H} \\
& \mathrm{RP} 1 \rightarrow \mathrm{C} 8 \mathrm{H}-\mathrm{CFH}
\end{aligned}
$$

This 16-byte address range is called common area. That is, locations in this area can be used as working registers by operations that address any location on any page in the register file. Typically, these working registers serve as temporary buffers for data operations between different pages.

Figure 2-13. Common Working Register Area

## PROGRAMMING TIP - Addressing the Common Working Register Area

As the following examples show, you should access working registers in the common area, locations $\mathrm{COH}-\mathrm{CFH}$, using working register addressing mode only.
Examples 1. LD $0 \mathrm{C} 2 \mathrm{H}, 40 \mathrm{H}$; Invalid addressing mode!

Use working register addressing instead:
SRP \#OCOH
LD $\quad \mathrm{R} 2,40 \mathrm{H} \quad ; \quad \mathrm{R} 2(\mathrm{C} 2 \mathrm{H}) \rightarrow \quad$ the value in location 40 H
2. ADD $0 \mathrm{C} 3 \mathrm{H}, \# 45 \mathrm{H}$; Invalid addressing mode!

Use working register addressing instead:

| SRP | $\# 0 \mathrm{COH}$ |  |
| :--- | :--- | :--- | :--- |
| ADD | $\mathrm{R} 3, \# 45 \mathrm{H}$ | $; \mathrm{R} 3(\mathrm{C} 3 \mathrm{H}) \rightarrow \mathrm{R} 3+45 \mathrm{H}$ |

## 4-BIT WORKING REGISTER ADDRESSING

Each register pointer defines a movable 8-byte slice of working register space. The address information stored in a register pointer serves as an addressing "window" that makes it possible for instructions to access working registers very efficiently using short 4-bit addresses. When an instruction addresses a location in the selected working register area, the address bits are concatenated in the following way to form a complete 8-bit address:
— The high-order bit of the 4-bit address selects one of the register pointers ("0" selects RP0, "1" selects RP1).

- The five high-order bits in the register pointer select an 8-byte slice of the register space.
- The three low-order bits of the 4-bit address select one of the eight registers in the slice.

As shown in Figure 2-14, the result of this operation is that the five high-order bits from the register pointer are concatenated with the three low-order bits from the instruction address to form the complete address. As long as the address stored in the register pointer remains unchanged, the three bits from the address will always point to an address in the same 8-byte register slice.

Figure 2-15 shows a typical example of 4-bit working register addressing. The high-order bit of the instruction "INC R6" is "0", which selects RP0. The five high-order bits stored in RP0 (01110B) are concatenated with the three low-order bits of the instruction's 4-bit address (110B) to produce the register address 76 H (01110110B).

Together they create an 8 -bit register address

Figure 2-14. 4-Bit Working Register Addressing

Figure 2-15. 4-Bit Working Register Addressing Example

## 8-BIT WORKING REGISTER ADDRESSING

You can also use 8-bit working register addressing to access registers in a selected working register area. To initiate 8 -bit working register addressing, the upper four bits of the instruction address must contain the value "1100B." This 4-bit value (1100B) indicates that the remaining four bits have the same effect as 4-bit working register addressing.

As shown in Figure 2-16, the lower nibble of the 8-bit address is concatenated in much the same way as for 4-bit addressing: Bit 3 selects either RP0 or RP1, which then supplies the five high-order bits of the final address; the three low-order bits of the complete address are provided by the original instruction.

Figure 2-17 shows an example of 8-bit working register addressing. The four high-order bits of the instruction address (1100B) specify 8 -bit working register addressing. Bit 4 ("1") selects RP1 and the five high-order bits in RP1 (10101B) become the five high-order bits of the register address. The three low-order bits of the register address (011) are provided by the three low-order bits of the 8 -bit instruction address. The five address bits from RP1 and the three address bits from the instruction are concatenated to form the complete register address, 0ABH (10101011B).

Figure 2-16. 8-Bit Working Register Addressing

Specifies working
register addressing

Figure 2-17. 8-Bit Working Register Addressing Example

## SYSTEM AND USER STACK

The S3C8-series microcontrollers use the system stack for data storage, subroutine calls and returns. The PUSH and POP instructions are used to control system stack operations. The S3C828B/C8289/C8285 architecture supports stack operations in the internal register file.

## Stack Operations

Return addresses for procedure calls, interrupts, and data are stored on the stack. The contents of the PC are saved to stack by a CALL instruction and restored by the RET instruction. When an interrupt occurs, the contents of the PC and the FLAGS register are pushed to the stack. The IRET instruction then pops these values back to their original locations. The stack address value is always decreased by one before a push operation and increased by one after a pop operation. The stack pointer (SP) always points to the stack frame stored on the top of the stack, as shown in Figure 2-18.

Figure 2-18. Stack Operations

## User-Defined Stacks

You can freely define stacks in the internal register file as data storage locations. The instructions PUSHUI, PUSHUD, POPUI, and POPUD support user-defined stack operations.

## Stack Pointers (SPL, SPH)

Register locations D8H and D9H contain the 16-bit stack pointer (SP) that is used for system stack operations. The most significant byte of the SP address, SP15-SP8, is stored in the SPH register (D8H), and the least significant byte, SP7-SP0, is stored in the SPL register (D9H). After a reset, the SP value is undetermined.

Because only internal memory space is implemented in the S3C828B/C8289/C8285, the SPL must be initialized to an 8 -bit value in the range $00 \mathrm{H}-\mathrm{FFH}$. The SPH register is not needed and can be used as a general-purpose register, if necessary.

When the SPL register contains the only stack pointer value (that is, when it points to a system stack in the register file), you can use the SPH register as a general-purpose data register. However, if an overflow or underflow condition occurs as a result of increasing or decreasing the stack address value in the SPL register during normal stack operations, the value in the SPL register will overflow (or underflow) to the SPH register, overwriting any other data that is currently stored there. To avoid overwriting data in the SPH register, you can initialize the SPL value to "FFH" instead of "00H".

## PROGRAMMING TIP — Standard Stack Operations Using PUSH and POP

The following example shows you how to perform stack operations in the internal register file using PUSH and POP instructions:

```
LD SPL,#OFFH ; SPL }\leftarrow\mathrm{ FFH
    ; (Normally, the SPL is set to 0FFH by the initialization
    ; routine)
•
•
\begin{tabular}{llll} 
PUSH & PP & \(;\) Stack address 0FEH & \(\leftarrow P P\) \\
PUSH & RP0 & \(;\) Stack address 0FDH & \(\leftarrow\) RP0 \\
PUSH & RP1 & \(;\) Stack address 0FCH & \(\leftarrow\) RP1 \\
PUSH & R3 & \(;\) Stack address 0FBH \(\leftarrow R 3\)
\end{tabular}
•
-
.
\begin{tabular}{lll} 
POP & R3 & \(; \mathrm{R} 3 \leftarrow\) Stack address 0FBH \\
POP & RP1 & \(; \mathrm{RP} 1 \leftarrow\) Stack address 0FCH \\
POP & \(\mathrm{RP0}\) & \(; \mathrm{RP0} \leftarrow\) Stack address 0FDH \\
POP & PP & \(; \mathrm{PP} \leftarrow\) Stack address 0FEH
\end{tabular}
```

## ADDRESSING MODES

## OVERVIEW

Instructions that are stored in program memory are fetched for execution using the program counter. Instructions indicate the operation to be performed and the data to be operated on. Addressing mode is the method used to determine the location of the data operand. The operands specified in SAM88RC instructions may be condition codes, immediate data, or a location in the register file, program memory, or data memory.

The S3C8-series instruction set supports seven explicit addressing modes. Not all of these addressing modes are available for each instruction. The seven addressing modes and their symbols are:

- Register (R)
- Indirect Register (IR)
- Indexed (X)
- Direct Address (DA)
- Indirect Address (IA)
- Relative Address (RA)
- Immediate (IM)

## REGISTER ADDRESSING MODE (R)

In Register addressing mode (R), the operand value is the content of a specified register or register pair (see Figure 3-1).

Working register addressing differs from Register addressing in that it uses a register pointer to specify an 8-byte working register space in the register file and an 8-bit register within that space (see Figure 3-2).

Figure 3-1. Register Addressing

Figure 3-2. Working Register Addressing

## INDIRECT REGISTER ADDRESSING MODE (IR)

In Indirect Register (IR) addressing mode, the content of the specified register or register pair is the address of the operand. Depending on the instruction used, the actual address may point to a register in the register file, to program memory (ROM), or to an external memory space (see Figures 3-3 through 3-6).

You can use any 8-bit register to indirectly address another register. Any 16-bit register pair can be used to indirectly address another memory location. Please note, however, that you cannot access locations COH-FFH in set 1 using the Indirect Register addressing mode.

Figure 3-3. Indirect Register Addressing to Register File

## INDIRECT REGISTER ADDRESSING MODE (Continued)

Figure 3-5. Indirect Working Register Addressing to Register File

## INDIRECT REGISTER ADDRESSING MODE (Concluded)

Figure 3-6. Indirect Working Register Addressing to Program or Data Memory

## INDEXED ADDRESSING MODE (X)

Indexed ( X ) addressing mode adds an offset value to a base address during instruction execution in order to calculate the effective operand address (see Figure 3-7). You can use Indexed addressing mode to access locations in the internal register file or in external memory. Please note, however, that you cannot access locations $\mathrm{COH}-\mathrm{FFH}$ in set 1 using Indexed addressing mode.

In short offset Indexed addressing mode, the 8-bit displacement is treated as a signed integer in the range -128 to +127 . This applies to external memory accesses only (see Figure 3-8.)

For register file addressing, an 8-bit base address provided by the instruction is added to an 8-bit offset contained in a working register. For external memory accesses, the base address is stored in the working register pair designated in the instruction. The 8 -bit or 16 -bit offset given in the instruction is then added to that base address (see Figure 3-9).

The only instruction that supports Indexed addressing mode for the internal register file is the Load instruction (LD). The LDC and LDE instructions support Indexed addressing mode for internal program memory and for external data memory, when implemented.

Figure 3-7. Indexed Addressing to Register File

## INDEXED ADDRESSING MODE (Continued)

Figure 3-8. Indexed Addressing to Program or Data Memory with Short Offset

## INDEXED ADDRESSING MODE (Concluded)

Figure 3-9. Indexed Addressing to Program or Data Memory

## DIRECT ADDRESS MODE (DA)

In Direct Address (DA) mode, the instruction provides the operand's 16-bit memory address. Jump (JP) and Call (CALL) instructions use this addressing mode to specify the 16-bit destination address that is loaded into the PC whenever a JP or CALL instruction is executed.

The LDC and LDE instructions can use Direct Address mode to specify the source or destination address for Load operations to program memory (LDC) or to external data memory (LDE), if implemented.

Figure 3-10. Direct Addressing for Load Instructions

## DIRECT ADDRESS MODE (Continued)

Figure 3-11. Direct Addressing for Call and Jump Instructions

## INDIRECT ADDRESS MODE (IA)

In Indirect Address (IA) mode, the instruction specifies an address located in the lowest 256 bytes of the program memory. The selected pair of memory locations contains the actual address of the next instruction to be executed. Only the CALL instruction can use the Indirect Address mode.

Because the Indirect Address mode assumes that the operand is located in the lowest 256 bytes of program memory, only an 8-bit address is supplied in the instruction; the upper bytes of the destination address are assumed to be all zeros.

Sample Instruction:
CALL \#40H ; The 16-bit value in program memory addresses 40H and 41 H is the subroutine start address.

Figure 3-12. Indirect Addressing

## RELATIVE ADDRESS MODE (RA)

In Relative Address (RA) mode, a twos-complement signed displacement between -128 and +127 is specified in the instruction. The displacement value is then added to the current PC value. The result is the address of the next instruction to be executed. Before this addition occurs, the PC contains the address of the instruction immediately following the current instruction.

Several program control instructions use the Relative Address mode to perform conditional jumps. The instructions that support RA addressing are BTJRF, BTJRT, DJNZ, CPIJE, CPIJNE, and JR.

Figure 3-13. Relative Addressing

## IMMEDIATE MODE (IM)

In Immediate (IM) addressing mode, the operand value used in the instruction is the value supplied in the operand field itself. The operand may be one byte or one word in length, depending on the instruction used. Immediate addressing mode is useful for loading constant values into registers.

Figure 3-14. Immediate Addressing

CONTROL REGISTERS

## OVERVIEW

In this chapter, detailed descriptions of the S3C828B/C8289/C8285 control registers are presented in an easy-toread format. You can use this chapter as a quick-reference source when writing application programs. Figure 4-1 illustrates the important features of the standard register description format.

Control register descriptions are arranged in alphabetical order according to register mnemonic. More detailed information about control registers is presented in the context of the specific peripheral hardware descriptions in Part II of this manual.

Data and counter registers are not described in detail in this reference chapter. More information about all of the registers used by a specific peripheral is presented in the corresponding peripheral descriptions in Part II of this manual.

The locations and read/write characteristics of all mapped registers in the S3C828B/C8289/C8285 register file are listed in Table 4-1. The hardware reset value for each mapped register is described in Chapter 8, "RESET and Power-Down."

Table 4-1. Set 1 Registers

| Register Name | Mnemonic | Decimal | Hex | R/W |
| :--- | :---: | :---: | :---: | :---: |
| Basic Timer Control Register | BTCON | 211 | D3H | R/W |

| 1 | Clear both clock frequency dividers |

## NOTES

1. When you write a " 1 " to BTCON.1, the basic timer counter value is cleared to " 00 H ". Immediately following the write operation, the BTCON. 1 value is automatically cleared to " 0 ".
2. When you write a "1" to BTCON.0, the corresponding frequency divider is cleared to " 00 H ". Immediately following the write operation, the BTCON. 0 value is automatically cleared to " 0 ".
3. The fxx is selected clock for system (main OSC. or sub OSC.).

## NOTES:

1. In the S3C828B microcontroller, the internal register file is configured as eleven pages (pages 0-9,15). The pages 0-9 are used for general purpose register file.
2. In the S3C8289 microcontroller, the internal register file is configured as eleven pages (pages 0-3,15). The pages 0-3 are used for general purpose register file.
3. In the S3C8285 microcontroller, the internal register file is configured as eleven pages (pages $0-1,15$ ). The pages 0-1 are used for general purpose register file.
4. The page 15 of S3C828B/C8289/C8285 is used for LCD data register or general purpose register.

## 5

## INTERRUPT STRUCTURE

## OVERVIEW

The S3C8-series interrupt structure has three basic components: levels, vectors, and sources. The SAM8 CPU recognizes up to eight interrupt levels and supports up to 128 interrupt vectors. When a specific interrupt level has more than one vector address, the vector priorities are established in hardware. A vector address can be assigned to one or more sources.

## Levels

Interrupt levels are the main unit for interrupt priority assignment and recognition. All peripherals and I/O blocks can issue interrupt requests. In other words, peripheral and I/O operations are interrupt-driven. There are eight possible interrupt levels: IRQ0-IRQ7, also called level 0-level 7. Each interrupt level directly corresponds to an interrupt request number (IRQn). The total number of interrupt levels used in the interrupt structure varies from device to device. The S3C828B/C8289/C8285 interrupt structure recognizes eight interrupt levels.

The interrupt level numbers 0 through 7 do not necessarily indicate the relative priority of the levels. They are just identifiers for the interrupt levels that are recognized by the CPU. The relative priority of different interrupt levels is determined by settings in the interrupt priority register, IPR. Interrupt group and subgroup logic controlled by IPR settings lets you define more complex priority relationships between different levels.

## Vectors

Each interrupt level can have one or more interrupt vectors, or it may have no vector address assigned at all. The maximum number of vectors that can be supported for a given level is 128 (The actual number of vectors used for S3C8-series devices is always much smaller). If an interrupt level has more than one vector address, the vector priorities are set in hardware. S3C828B/C8289/C8285 uses eighteen vectors.

## Sources

A source is any peripheral that generates an interrupt. A source can be an external pin or a counter overflow. Each vector can have several interrupt sources. In the S3C828B/C8289/C8285 interrupt structure, there are eighteen possible interrupt sources.

When a service routine starts, the respective pending bit should be either cleared automatically by hardware or cleared "manually" by program software. The characteristics of the source's pending mechanism determine which method would be used to clear its respective pending bit.

## INTERRUPT TYPES

The three components of the S3C8 interrupt structure described before - levels, vectors, and sources - are combined to determine the interrupt structure of an individual device and to make full use of its available interrupt logic. There are three possible combinations of interrupt structure components, called interrupt types 1, 2, and 3. The types differ in the number of vectors and interrupt sources assigned to each level (see Figure 5-1):

Type 1: $\quad$ One level (IRQn) + one vector $\left(V_{1}\right)+$ one source $\left(S_{1}\right)$
Type 2: $\quad$ One level (IRQn) + one vector $\left(V_{1}\right)+$ multiple sources $\left(S_{1}-S_{n}\right)$
Type 3: One level (IRQn) + multiple vectors $\left(V_{1}-V_{n}\right)+$ multiple sources $\left(S_{1}-S_{n}, S_{n+1}-S_{n+m}\right)$

In the S3C828B/C8289/C8285 microcontroller, two interrupt types are implemented.

Figure 5-1. S3C8-Series Interrupt Types

## S3C828B/C8289/C8285 INTERRUPT STRUCTURE

The S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller supports nineteen interrupt sources. All nineteen of the interrupt sources have a corresponding interrupt vector address. Eight interrupt levels are recognized by the CPU in this device-specific interrupt structure, as shown in Figure 5-2.

When multiple interrupt levels are active, the interrupt priority register (IPR) determines the order in which contending interrupts are to be serviced. If multiple interrupts occur within the same interrupt level, the interrupt with the lowest vector address is usually processed first (The relative priorities of multiple interrupts within a single level are fixed in hardware).

When the CPU grants an interrupt request, interrupt processing starts. All other interrupts are disabled and the program counter value and status flags are pushed to stack. The starting address of the service routine is fetched from the appropriate vector address (plus the next 8 -bit value to concatenate the full 16 -bit address) and the service routine is executed.

| Levels | Vectors | Sources | Reset/Clear |
| :---: | :---: | :---: | :---: |
| RESET | 100H | Basic Timer Overflow | H/W |
|  | DCH | Timer A match/capture | S/W |
|  | DEH | Timer A overflow | H/W,S/W |
| IRQ1 | EOH | Timer B match | H/W |
| IRQ2 | E2H | Timer 0 match | S/W |
|  | E4H | Timer 1 match/capture | S/W |
|  | E6H | Timer 1 overflow | H/W,S/W |
| IRQ4 | E8H | SIO interrupt | S/W |
|  | EAH | UART data transmit | S/W |
| IRQ5 | ECH | UART data receive | S/W |
|  | EEH | Watch timer overflow | S/W |
|  | FOH | P0.0 External interrupt | S/W |
|  | F2H | P0.1 External interrupt | S/W |
| IRQ | F4H | P0.2 External interrupt | S/W |
|  | F6H | P0.3 External interrupt | S/W |
| IRQ7 | F8H | P0.4 External interrupt | S/W |
|  | FAH | P0.5 External interrupt | S/W |
|  | FCH | P0.6 External interrupt | S/W |
|  | FEH | P0.7 External interrupt | S/W |

## NOTES:

1. Within a given interrupt level, the low vector address has high priority. For example, DCH has higher priority than DEH within the level IRQ0 the priorities within each level are set at the factory.
2. External interrupts are triggered by a rising or falling edge, depending on the corresponding control register setting.

Figure 5-2. S3C828B/C8289/C8285 Interrupt Structure

## INTERRUPT VECTOR ADDRESSES

All interrupt vector addresses for the S3C828B/F828B/C8289/F8289/C8285/F8285 interrupt structure are stored in the vector address area of the internal 64-Kbyte ROM, 0H-FFFFH, or 16,32-Kbyte (see Figure 5-3).

You can allocate unused locations in the vector address area as normal program memory. If you do so, please be careful not to overwrite any of the stored vector addresses (Table 5-1 lists all vector addresses).

The program reset address in the ROM is 0100 H .

Figure 5-3. ROM Vector Address Area

Table 5-1. Interrupt Vectors

| Vector Address |  | Interrupt Source | Request |  | Reset/Clear |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Decimal Value | Hex <br> Value |  | Interrupt Level | Priority in Level | H/W | S/W |
| 256 | 100H | Basic timer overflow | Reset | - | $\checkmark$ |  |
| 220 | DCH | Timer A match/capture | IRQ0 | 0 |  | $\checkmark$ |
| 222 | DEH | Timer A overflow |  | 1 | $\checkmark$ | $\sqrt{ }$ |
| 224 | EOH | Timer B match | IRQ1 | - | $\checkmark$ |  |
| 226 | E2H | Timer 0 match | IRQ2 | - |  | $\checkmark$ |
| 228 | E4H | Timer 1 match/capture | IRQ3 | 0 |  | $\checkmark$ |
| 230 | E6H | Timer 1 overflow |  | 1 | $\checkmark$ | $\checkmark$ |
| 232 | E8H | SIO interrupt | IRQ4 | - |  | $\checkmark$ |
| 234 | EAH | UART data transmit | IRQ5 | 0 |  | $\checkmark$ |
| 236 | ECH | UART data receive |  | 1 |  | $\checkmark$ |
| 238 | EEH | Watch timer overflow |  | 2 |  | $\sqrt{ }$ |
| 240 | FOH | P0.0 external interrupt | IRQ6 | 0 |  | $\checkmark$ |
| 242 | F2H | P0.1 external interrupt |  | 1 |  | $\checkmark$ |
| 244 | F4H | P0.2 external interrupt |  | 2 |  | $\checkmark$ |
| 246 | F6H | P0.3 external interrupt |  | 3 |  | $\checkmark$ |
| 248 | F8H | P0.4 external interrupt | IRQ7 | 0 |  | $\checkmark$ |
| 250 | FAH | P0.5 external interrupt |  | 1 |  | $\checkmark$ |
| 252 | FCH | P0.6 external interrupt |  | 2 |  | $\checkmark$ |
| 254 | FEH | P0.7 external interrupt |  | 3 |  | $\checkmark$ |

## NOTES:

1. Interrupt priorities are identified in inverse order: " 0 " is the highest priority, " 1 " is the next highest, and so on.
2. If two or more interrupts within the same level contend, the interrupt with the lowest vector address usually has priority over one with a higher vector address. The priorities within a given level are fixed in hardware.
3. Timer A or Timer 1 can not service two interrupt sources simultaneously, then only one interrupt source have to be used.

## ENABLEIDISABLE INTERRUPT INSTRUCTIONS (EI, DI)

Executing the Enable Interrupts (EI) instruction globally enables the interrupt structure. All interrupts are then serviced as they occur according to the established priorities.

## NOTE

The system initialization routine executed after a reset must always contain an El instruction to globally enable the interrupt structure.

During the normal operation, you can execute the DI (Disable Interrupt) instruction at any time to globally disable interrupt processing. The EI and DI instructions change the value of bit 0 in the SYM register.

## SYSTEM-LEVEL INTERRUPT CONTROL REGISTERS

In addition to the control registers for specific interrupt sources, four system-level registers control interrupt processing:

- The interrupt mask register, IMR, enables (un-masks) or disables (masks) interrupt levels.
- The interrupt priority register, IPR, controls the relative priorities of interrupt levels.
- The interrupt request register, IRQ, contains interrupt pending flags for each interrupt level (as opposed to each interrupt source).
- The system mode register, SYM, enables or disables global interrupt processing (SYM settings also enable fast interrupts and control the activity of external interface, if implemented).

Table 5-2. Interrupt Control Register Overview

| Control Register | ID | R/W | Function Description |
| :---: | :---: | :---: | :--- |
| Interrupt mask register | IMR | R/W | Bit settings in the IMR register enable or disable interrupt <br> processing for each of the eight interrupt levels: IRQ0-IRQ7. |
| Interrupt priority register | IPR | R/W | Controls the relative processing priorities of the interrupt levels. <br> The seven levels of S3C828B/F828B/C8289/F8289/C8285/ <br> F8285 are organized into three groups: A, B, and C. Group A <br> is IRQ0 and IRQ1, group B is IRQ2, IRQ3 and IRQ4, and <br> group C is IRQ5, IRQ6, and IRQ7. |
| Interrupt request register | IRQ | R | This register contains a request pending bit for each interrupt <br> level. |
| System mode register | SYM | R/W | This register enables/disables fast interrupt processing, <br> dynamic global interrupt processing, and external interface <br> control (An external memory interface is implemented in the <br> S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller). |

## INTERRUPT PROCESSING CONTROL POINTS

Interrupt processing can therefore be controlled in two ways: globally or by specific interrupt level and source. The system-level control points in the interrupt structure are:

- Global interrupt enable and disable (by El and DI instructions or by direct manipulation of SYM.0 )
- Interrupt level enable/disable settings (IMR register)
— Interrupt level priority settings (IPR register)
- Interrupt source enable/disable settings in the corresponding peripheral control registers

NOTE
When writing an application program that handles interrupt processing, be sure to include the necessary register file address (register pointer) information.

Figure 5-4. Interrupt Function Diagram

## PERIPHERAL INTERRUPT CONTROL REGISTERS

For each interrupt source there is one or more corresponding peripheral control registers that let you control the interrupt generated by the related peripheral (see Table 5-3).

Table 5-3. Interrupt Source Control and Data Registers

| Interrupt Source | Interrupt Level | Register(s) | Location(s) in Set 1 |
| :---: | :---: | :---: | :---: |

NOTE: If a interrupt is un-mask(Enable interrupt level) in the IMR register, the pending bit and enable bit of the interrupt should be written after a DI instruction is executed.

## SYSTEM MODE REGISTER (SYM)

The system mode register, SYM (set 1, DEH), is used to globally enable and disable interrupt processing and to control fast interrupt processing (see Figure 5-5).

A reset clears SYM.1, and SYM. 0 to " 0 ". The 3-bit value for fast interrupt level selection, SYM.4-SYM.2, is undetermined.

The instructions EI and DI enable and disable global interrupt processing, respectively, by modifying the bit 0 value of the SYM register. In order to enable interrupt processing an Enable Interrupt (EI) instruction must be included in the initialization routine, which follows a reset operation. Although you can manipulate SYM. 0 directly to enable and disable interrupts during the normal operation, it is recommended to use the EI and DI instructions for this purpose.

NOTES:

1. You can select only one interrupt level at a time for fast interrupt processing.
2. Setting SYM. 1 to "1" enables fast interrupt processing for the interrupt processing for the interrupt level currently selected by SYM.2-SYM.4.
3. Following a reset, you must enable global interrupt processing by executing El instruction (not by writing a "1" to SYM.0)

Figure 5-5. System Mode Register (SYM)

## INTERRUPT MASK REGISTER (IMR)

The interrupt mask register, IMR (set 1, DDH) is used to enable or disable interrupt processing for individual interrupt levels. After a reset, all IMR bit values are undetermined and must therefore be written to their required settings by the initialization routine.

Each IMR bit corresponds to a specific interrupt level: bit 1 to IRQ1, bit 2 to IRQ2, and so on. When the IMR bit of an interrupt level is cleared to " 0 ", interrupt processing for that level is disabled (masked). When you set a level's IMR bit to " 1 ", interrupt processing for the level is enabled (not masked).

The IMR register is mapped to register location DDH in set 1 . Bit values can be read and written by instructions using the Register addressing mode.

Figure 5-6. Interrupt Mask Register (IMR)

## INTERRUPT PRIORITY REGISTER (IPR)

The interrupt priority register, IPR (set 1, bank 0, FFH), is used to set the relative priorities of the interrupt levels in the microcontroller's interrupt structure. After a reset, all IPR bit values are undetermined and must therefore be written to their required settings by the initialization routine.

When more than one interrupt sources are active, the source with the highest priority level is serviced first. If two sources belong to the same interrupt level, the source with the lower vector address usually has the priority (This priority is fixed in hardware).

To support programming of the relative interrupt level priorities, they are organized into groups and subgroups by the interrupt logic. Please note that these groups (and subgroups) are used only by IPR logic for the IPR register priority definitions (see Figure 5-7):

Group A IRQ0, IRQ1
Group B IRQ2, IRQ3, IRQ4
Group C IRQ5, IRQ6, IRQ7

Figure 5-7. Interrupt Request Priority Groups

As you can see in Figure 5-8, IPR.7, IPR.4, and IPR. 1 control the relative priority of interrupt groups A, B, and C. For example, the setting "001B" for these bits would select the group relationship B > C > A. The setting "101B" would select the relationship $C>B>A$.

The functions of the other IPR bit settings are as follows:

- IPR. 5 controls the relative priorities of group C interrupts.
- Interrupt group C includes a subgroup that has an additional priority relationship among the interrupt levels 5, 6 , and 7. IPR. 6 defines the subgroup C relationship. IPR. 5 controls the interrupt group C.
- IPR. 0 controls the relative priority setting of IRQ0 and IRQ1 interrupts.

Figure 5-8. Interrupt Priority Register (IPR)

## INTERRUPT REQUEST REGISTER (IRQ)

You can poll bit values in the interrupt request register, IRQ (set 1, DCH), to monitor interrupt request status for all levels in the microcontroller's interrupt structure. Each bit corresponds to the interrupt level of the same number: bit 0 to IRQ0, bit 1 to IRQ1, and so on. A "0" indicates that no interrupt request is currently being issued for that level. A "1" indicates that an interrupt request has been generated for that level.

IRQ bit values are read-only addressable using Register addressing mode. You can read (test) the contents of the IRQ register at any time using bit or byte addressing to determine the current interrupt request status of specific interrupt levels. After a reset, all IRQ status bits are cleared to "0".

You can poll IRQ register values even if a DI instruction has been executed (that is, if global interrupt processing is disabled). If an interrupt occurs while the interrupt structure is disabled, the CPU will not service it. You can, however, still detect the interrupt request by polling the IRQ register. In this way, you can determine which events occurred while the interrupt structure was globally disabled.

Figure 5-9. Interrupt Request Register (IRQ)

## INTERRUPT PENDING FUNCTION TYPES

## Overview

There are two types of interrupt pending bits: one type that is automatically cleared by hardware after the interrupt service routine is acknowledged and executed; the other that must be cleared in the interrupt service routine.

## Pending Bits Cleared Automatically by Hardware

For interrupt pending bits that are cleared automatically by hardware, interrupt logic sets the corresponding pending bit to "1" when a request occurs. It then issues an IRQ pulse to inform the CPU that an interrupt is waiting to be serviced. The CPU acknowledges the interrupt source by sending an IACK, executes the service routine, and clears the pending bit to " 0 ". This type of pending bit is not mapped and cannot, therefore, be read or written by application software.

In the S3C828B/C8289/C8285 interrupt structure, the timer A overflow interrupt (IRQ0) belongs to this category of interrupts in which pending condition is cleared automatically by hardware.

## Pending Bits Cleared by the Service Routine

The second type of pending bit is the one that should be cleared by program software. The service routine must clear the appropriate pending bit before a return-from-interrupt subroutine (IRET) occurs. To do this, a "0" must be written to the corresponding pending bit location in the source's mode or control register.

## INTERRUPT SOURCE POLLING SEQUENCE

The interrupt request polling and servicing sequence is as follows:

1. A source generates an interrupt request by setting the interrupt request bit to "1".
2. The CPU polling procedure identifies a pending condition for that source.
3. The CPU checks the sources interrupt level.
4. The CPU generates an interrupt acknowledge signal.
5. Interrupt logic determines the interrupt's vector address.
6. The service routine starts and the source's pending bit is cleared to " 0 " (by hardware or by software).
7. The CPU continues polling for interrupt requests.

## INTERRUPT SERVICE ROUTINES

Before an interrupt request is serviced, the following conditions must be met:
— Interrupt processing must be globally enabled (EI, SYM. $0=$ " 1 ")

- The interrupt level must be enabled (IMR register)
- The interrupt level must have the highest priority if more than one levels are currently requesting service
- The interrupt must be enabled at the interrupt's source (peripheral control register)

When all the above conditions are met, the interrupt request is acknowledged at the end of the instruction cycle. The CPU then initiates an interrupt machine cycle that completes the following processing sequence:

1. Reset (clear to "0") the interrupt enable bit in the SYM register (SYM.0) to disable all subsequent interrupts.
2. Save the program counter (PC) and status flags to the system stack.
3. Branch to the interrupt vector to fetch the address of the service routine.
4. Pass control to the interrupt service routine.

When the interrupt service routine is completed, the CPU issues an Interrupt Return (IRET). The IRET restores the PC and status flags, setting SYM. 0 to "1". It allows the CPU to process the next interrupt request.

## GENERATING INTERRUPT VECTOR ADDRESSES

The interrupt vector area in the ROM ( $00 \mathrm{H}-\mathrm{FFH}$ ) contains the addresses of interrupt service routines that correspond to each level in the interrupt structure. Vectored interrupt processing follows this sequence:

1. Push the program counter's low-byte value to the stack.
2. Push the program counter's high-byte value to the stack.
3. Push the FLAG register values to the stack.
4. Fetch the service routine's high-byte address from the vector location.
5. Fetch the service routine's low-byte address from the vector location.
6. Branch to the service routine specified by the concatenated 16 -bit vector address.

## NOTE

A 16-bit vector address always begins at an even-numbered ROM address within the range of $00 \mathrm{H}-\mathrm{FFH}$.

## NESTING OF VECTORED INTERRUPTS

It is possible to nest a higher-priority interrupt request while a lower-priority request is being serviced. To do this, you must follow these steps:

1. Push the current 8-bit interrupt mask register (IMR) value to the stack (PUSH IMR).
2. Load the IMR register with a new mask value that enables only the higher priority interrupt.
3. Execute an El instruction to enable interrupt processing (a higher priority interrupt will be processed if it occurs).
4. When the lower-priority interrupt service routine ends, restore the IMR to its original value by returning the previous mask value from the stack (POP IMR).
5. Execute an IRET.

Depending on the application, you may be able to simplify the procedure above to some extent.

## INSTRUCTION POINTER (IP)

The instruction pointer (IP) is adopted by all the S3C8-series microcontrollers to control the optional high-speed interrupt processing feature called fast interrupts. The IP consists of register pair DAH and DBH. The names of IP registers are IPH (high byte, IP15-IP8) and IPL (low byte, IP7-IP0).

## FAST INTERRUPT PROCESSING

The feature called fast interrupt processing allows an interrupt within a given level to be completed in approximately 6 clock cycles rather than the usual 16 clock cycles. To select a specific interrupt level for fast interrupt processing, you write the appropriate 3-bit value to SYM.4-SYM.2. Then, to enable fast interrupt processing for the selected level, you set SYM. 1 to "1".

## FAST INTERRUPT PROCESSING (Continued)

Two other system registers support fast interrupt processing:

- The instruction pointer (IP) contains the starting address of the service routine (and is later used to swap the program counter values), and
- When a fast interrupt occurs, the contents of the FLAGS register is stored in an unmapped, dedicated register called FLAGS' ("FLAGS prime").

## NOTE

For the S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller, the service routine for any one of the eight interrupt levels: IRQ0-IRQ7, can be selected for fast interrupt processing.

## Procedure for Initiating Fast Interrupts

To initiate fast interrupt processing, follow these steps:

1. Load the start address of the service routine into the instruction pointer (IP).
2. Load the interrupt level number (IRQn) into the fast interrupt selection field (SYM.4-SYM.2)
3. Write a "1" to the fast interrupt enable bit in the SYM register.

## Fast Interrupt Service Routine

When an interrupt occurs in the level selected for fast interrupt processing, the following events occur:

1. The contents of the instruction pointer and the PC are swapped.
2. The FLAG register values are written to the FLAGS' ("FLAGS prime") register.
3. The fast interrupt status bit in the FLAGS register is set.
4. The interrupt is serviced.
5. Assuming that the fast interrupt status bit is set, when the fast interrupt service routine ends, the instruction pointer and PC values are swapped back.
6. The content of FLAGS' ("FLAGS prime") is copied automatically back to the FLAGS register.
7. The fast interrupt status bit in FLAGS is cleared automatically.

## Relationship to Interrupt Pending Bit Types

As described previously, there are two types of interrupt pending bits: One type that is automatically cleared by hardware after the interrupt service routine is acknowledged and executed; the other that must be cleared by the application program's interrupt service routine. You can select fast interrupt processing for interrupts with either type of pending condition clear function - by hardware or by software.

## Programming Guidelines

Remember that the only way to enable/disable a fast interrupt is to set/clear the fast interrupt enable bit in the SYM register, SYM.1. Executing an El or DI instruction globally enables or disables all interrupt processing, including fast interrupts. If you use fast interrupts, remember to load the IP with a new start address when the fast interrupt service routine ends.

## (8) INSTRUCTION SET

## OVERVIEW

The SAM8 instruction set is specifically designed to support the large register files that are typical of most SAM8 microcontrollers. There are 78 instructions. The powerful data manipulation capabilities and features of the instruction set include:

- A full complement of 8-bit arithmetic and logic operations, including multiply and divide
- No special I/O instructions (I/O control/data registers are mapped directly into the register file)
- Decimal adjustment included in binary-coded decimal (BCD) operations
- 16-bit (word) data can be incremented and decremented
- Flexible instructions for bit addressing, rotate, and shift operations

## DATA TYPES

The SAM8 CPU performs operations on bits, bytes, BCD digits, and two-byte words. Bits in the register file can be set, cleared, complemented, and tested. Bits within a byte are numbered from 7 to 0 , where bit 0 is the least significant (right-most) bit.

## REGISTER ADDRESSING

To access an individual register, an 8 -bit address in the range $0-255$ or the 4 -bit address of a working register is specified. Paired registers can be used to construct 16-bit data or 16-bit program memory or data memory addresses. For detailed information about register addressing, please refer to Section 2, "Address Spaces."

## ADDRESSING MODES

There are seven explicit addressing modes: Register (R), Indirect Register (IR), Indexed (X), Direct (DA), Relative (RA), Immediate (IM), and Indirect (IA). For detailed descriptions of these addressing modes, please refer to Section 3, "Addressing Modes."

Table 6-1. Instruction Group Summary

| Mnemonic | Operands |  |
| :--- | :--- | :--- |
|  |  |  |
| Load Instructions |  |  |
| CLR | dst | Clear |
| LD | $d s t, s r c$ | Load |
| LDB | $d s t, s r c$ | Load bit |
| LDE | $d s t, s r c$ | Load external data memory |
| LDC | $d s t, s r c$ | Load program memory |
| LDED | $d s t, s r c$ | Load external data memory and decrement |
| LDCD | $d s t, s r c$ | Load program memory and decrement |
| LDEI | $d s t, s r c$ | Load external data memory and increment |
| LDCI | $d s t, s r c$ | Load program memory and increment |
| LDEPD | $d s t, s r c$ | Load external data memory with pre-decrement |
| LDCPD | $d s t, s r c$ | Load program memory with pre-decrement |
| LDEPI | $d s t, s r c$ | Load external data memory with pre-increment |
| LDCPI | $d s t, s r c$ | Load program memory with pre-increment |
| LDW | $d s t, s r c$ | Load word |
| POP | $d s t$ | Pop from stack |
| POPUD | $d s t, s r c$ | Pop user stack (decrementing) |
| POPUI | $d s t, s r c$ | Pop user stack (incrementing) |
| PUSH | $s r c$ | Push to stack |
| PUSHUD | $d s t, s r c$ | Push user stack (decrementing) |
| PUSHUI | $d s t, s r c$ | Push user stack (incrementing) |

Table 6-1. Instruction Group Summary (Continued)

| Mnemonic | Operands | Instruction |

| SCF |  | Set carry flag |
| SRP |  | Set register pointers |
| SRP0 |  | Set register pointer 0 |
| SRP1 |  | Enter Stop mode |
| STOP |  |  |

## FLAGS REGISTER (FLAGS)

The flags register FLAGS contains eight bits that describe the current status of CPU operations. Four of these bits, FLAGS.7-FLAGS.4, can be tested and used with conditional jump instructions; two others FLAGS. 3 and FLAGS. 2 are used for BCD arithmetic.

The FLAGS register also contains a bit to indicate the status of fast interrupt processing (FLAGS.1) and a bank address status bit (FLAGS.0) to indicate whether bank 0 or bank 1 is currently being addressed. FLAGS register can be set or reset by instructions as long as its outcome does not affect the flags, such as, Load instruction.

Logical and Arithmetic instructions such as, AND, OR, XOR, ADD, and SUB can affect the Flags register. For example, the AND instruction updates the Zero, Sign and Overflow flags based on the outcome of the AND instruction. If the AND instruction uses the Flags register as the destination, then simultaneously, two write will occur to the Flags register producing an unpredictable result.

Figure 6-1. System Flags Register (FLAGS)

## FLAG DESCRIPTIONS

## C Carry Flag (FLAGS.7)

The C flag is set to " 1 " if the result from an arithmetic operation generates a carry-out from or a borrow to the bit 7 position (MSB). After rotate and shift operations, it contains the last value shifted out of the specified register. Program instructions can set, clear, or complement the carry flag.

## Z Zero Flag (FLAGS.6)

For arithmetic and logic operations, the Z flag is set to "1" if the result of the operation is zero. For operations that test register bits, and for shift and rotate operations, the Z flag is set to " 1 " if the result is logic zero.

## S Sign Flag (FLAGS.5)

Following arithmetic, logic, rotate, or shift operations, the sign bit identifies the state of the MSB of the result. A logic zero indicates a positive number and a logic one indicates a negative number.

## V Overflow Flag (FLAGS.4)

The $V$ flag is set to " 1 " when the result of a two's-complement operation is greater than +127 or less than - 128. It is also cleared to " 0 " following logic operations.

D Decimal Adjust Flag (FLAGS.3)
The DA bit is used to specify what type of instruction was executed last during BCD operations, so that a subsequent decimal adjust operation can execute correctly. The DA bit is not usually accessed by programmers, and cannot be used as a test condition.

## H Half-Carry Flag (FLAGS.2)

The H bit is set to "1" whenever an addition generates a carry-out of bit 3 , or when a subtraction borrows out of bit 4. It is used by the Decimal Adjust (DA) instruction to convert the binary result of a previous addition or subtraction into the correct decimal (BCD) result. The H flag is seldom accessed directly by a program.

## FIS Fast Interrupt Status Flag (FLAGS.1)

The FIS bit is set during a fast interrupt cycle and reset during the IRET following interrupt servicing. When set, it inhibits all interrupts and causes the fast interrupt return to be executed when the IRET instruction is executed.

## BA Bank Address Flag (Flags.0)

The BA flag indicates which register bank in the set 1 area of the internal register file is currently selected, bank 0 or bank 1. The BA flag is cleared to " 0 " (select bank 0 ) when you execute the SB0 instruction and is set to "1" (select bank 1) when you execute the SB1 instruction.

## INSTRUCTION SET NOTATION

Table 6-2. Flag Notation Conventions

| Flag |  |
| :---: | :--- |
| C | Carry flag |
| Z | Zero flag |
| S | Sign flag |
| V | Overflow flag |
| D | Decimal-adjust flag |
| H | Half-carry flag |
| 0 | Cleared to logic zero |
| 1 | Set to logic one |
| * | Set or cleared according to operation |
| - | Value is unaffected |
| x | Value is undefined |

Table 6-3. Instruction Set Symbols

| Symbol | Description |
| :---: | :--- |
| dst | Destination operand |
| src | Source operand |
| @ | Indirect register address prefix |
| PC | Program counter |
| IP | Instruction pointer |
| FLAGS | Flags register (D5H) |
| RP | Register pointer |
| \# | Immediate operand or register address prefix |
| H | Hexadecimal number suffix |
| D | Decimal number suffix |
| B | Binary number suffix |
| opc | Opcode |

Table 6-4. Instruction Notation Conventions

| Notation | Description | Actual Operand Range |
| :---: | :---: | :---: |
| CC | Condition code | See list of condition codes in Table 6-6. |
| $r$ | Working register only | Rn ( $\mathrm{n}=0-15$ ) |
| rb | Bit (b) of working register | Rn.b ( $\mathrm{n}=0-15, \mathrm{~b}=0-7$ ) |
| r0 | Bit 0 (LSB) of working register | $\mathrm{Rn}(\mathrm{n}=0-15)$ |
| rr | Working register pair | $\operatorname{RRp}(\mathrm{p}=0,2,4, \ldots, 14)$ |
| R | Register or working register | reg or Rn (reg = 0-255, $\mathrm{n}=0-15$ ) |
| Rb | Bit 'b' of register or working register | reg.b (reg = 0-255, b=0-7) |
| RR | Register pair or working register pair | reg or RRp (reg = 0-254, even number only, where $p=0,2, \ldots, 14)$ |
| IA | Indirect addressing mode | addr (addr = 0-254, even number only) |
| Ir | Indirect working register only | @Rn ( $\mathrm{n}=0-15$ ) |
| IR | Indirect register or indirect working register | @Rn or @reg (reg = 0-255, n=0-15) |
| Irr | Indirect working register pair only | @RRp (p = 0, 2, ..., 14) |
| IRR | Indirect register pair or indirect working register pair | @RRp or @reg (reg = 0-254, even only, where $p=0,2, \ldots, 14)$ |
| X | Indexed addressing mode | \#reg [Rn] (reg = 0-255, $\mathrm{n}=0-15$ ) |
| XS | Indexed (short offset) addressing mode | \#addr [RRp] (addr = range -128 to +127 , where $p=0,2, \ldots, 14)$ |
| x | Indexed (long offset) addressing mode | \#addr [RRp] (addr = range 0-65535, where $p=0,2, \ldots, 14)$ |
| da | Direct addressing mode | addr (addr = range 0-65535) |
| ra | Relative addressing mode | addr (addr $=$ number in the range +127 to -128 that is an offset relative to the address of the next instruction) |
| im | Immediate addressing mode | \#data (data $=0-255$ ) |
| iml | Immediate (long) addressing mode | \#data (data = range 0-65535) |

## CONDITION CODES

The opcode of a conditional jump always contains a 4-bit field called the condition code (cc). This specifies under which conditions it is to execute the jump. For example, a conditional jump with the condition code for "equal" after a compare operation only jumps if the two operands are equal. Condition codes are listed in Table 6-6.

The carry (C), zero (Z), sign (S), and overflow (V) flags are used to control the operation of conditional jump instructions.

Table 6-6. Condition Codes

| Binary | Mnemonic | Description | Flags Set |
| :---: | :---: | :---: | :---: |
| 0000 | F | Always false | - |
| 1000 | T | Always true | - |
| 0111 (note) | C | Carry | $C=1$ |
| 1111 (note) | NC | No carry | $C=0$ |
| 0110 (note) | Z | Zero | $Z=1$ |
| 1110 (note) | NZ | Not zero | $Z=0$ |
| 1101 | PL | Plus | $S=0$ |
| 0101 | MI | Minus | $S=1$ |
| 0100 | OV | Overflow | $V=1$ |
| 1100 | NOV | No overflow | $V=0$ |
| 0110 (note) | EQ | Equal | $Z=1$ |
| 1110 (note) | NE | Not equal | $\mathrm{Z}=0$ |
| 1001 | GE | Greater than or equal | $\left(\begin{array}{lll}\text { S XOR }\end{array}\right.$ |
| 0001 | LT | Less than | $(\mathrm{S}$ XOR V) $=1$ |
| 1010 | GT | Greater than | $(Z \quad$ OR $(S$ XOR V $)$ ) $=0$ |
| 0010 | LE | Less than or equal | $(Z \quad$ OR $(S$ XOR V $)$ ) $=1$ |
| 1111 (note) | UGE | Unsigned greater than or equal | $C=0$ |
| 0111 (note) | ULT | Unsigned less than | $C=1$ |
| 1011 | UGT | Unsigned greater than | $(\mathrm{C}=0 \quad$ AND $\quad Z=0)=1$ |
| 0011 | ULE | Unsigned less than or equal | $\left(\begin{array}{lll}\text { C OR }\end{array}\right)=1$ |

## NOTES:

1. It indicates condition codes that are related to two different mnemonics but which test the same flag. For example, $Z$ and $E Q$ are both true if the zero flag $(Z)$ is set, but after an ADD instruction, $Z$ would probably be used; after a CP instruction, however, EQ would probably be used.
2. For operations involving unsigned numbers, the special condition codes UGE, ULT, UGT, and ULE must be used.

## INSTRUCTION DESCRIPTIONS

This section contains detailed information and programming examples for each instruction in the SAM8 instruction set. Information is arranged in a consistent format for improved readability and for fast referencing. The following information is included in each instruction description:

- Instruction name (mnemonic)
- Full instruction name
- Source/destination format of the instruction operand
- Shorthand notation of the instruction's operation
- Textual description of the instruction's effect
- Specific flag settings affected by the instruction
- Detailed description of the instruction's format, execution time, and addressing mode(s)
- Programming example(s) explaining how to use the instruction

## ADC - Add with carry

ADC dst,src
Operation: dst $\leftarrow$ dst + src +c
The source operand, along with the setting of the carry flag, is added to the destination operand and the sum is stored in the destination. The contents of the source are unaffected. Two'scomplement addition is performed. In multiple precision arithmetic, this instruction permits the carry from the addition of low-order operands to be carried into the addition of high-order operands.

Flags: $\quad$ C: Set if there is a carry from the most significant bit of the result; cleared otherwise.
Z: Set if the result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurs, that is, if both operands are of the same sign and the result is of the opposite sign; cleared otherwise.
D: Always cleared to " 0 ".
H: Set if there is a carry from the most significant bit of the low-order four bits of the result; cleared otherwise.
Format:

Examples: Given: R1 $=10 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}, \mathrm{C}$ flag $=$ " 1 ", register $01 \mathrm{H}=20 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$, and register $03 \mathrm{H}=0 \mathrm{AH}$ :

| ADC | $\mathrm{R} 1, \mathrm{R} 2$ | $\rightarrow$ | $\mathrm{R} 1=14 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$ |
| :--- | :--- | :--- | :--- |
| ADC | $\mathrm{R} 1, @ \mathrm{R} 2$ | $\rightarrow$ | $\mathrm{R} 1=1 \mathrm{BH}, \mathrm{R} 2=03 \mathrm{H}$ |
| ADC | $01 \mathrm{H}, 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=24 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| ADC | $01 \mathrm{H}, @ 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=2 \mathrm{BH}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| ADC | $01 \mathrm{H}, \# 11 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=32 \mathrm{H}$ |

In the first example, destination register R1 contains the value 10 H , the carry flag is set to "1", and the source working register R2 contains the value 03H. The statement "ADC R1,R2" adds 03 H and the carry flag value ("1") to the destination value 10 H , leaving 14 H in register R1.

## ADD - Add

ADD dst,src
Operation: dst $\leftarrow$ dst + src
The source operand is added to the destination operand and the sum is stored in the destination. The contents of the source are unaffected. Two's-complement addition is performed.

Flags: C: Set if there is a carry from the most significant bit of the result; cleared otherwise.
Z: Set if the result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred, that is, if both operands are of the same sign and the result is of the opposite sign; cleared otherwise.
D: Always cleared to "0".
H: Set if a carry from the low-order nibble occurred.

## Format:

Examples: Given: R1 $=12 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$, register $01 \mathrm{H}=21 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$, register $03 \mathrm{H}=0 \mathrm{AH}$ :

| ADD | $\mathrm{R} 1, \mathrm{R} 2$ | $\rightarrow$ | $\mathrm{R} 1=15 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$ |
| :--- | :--- | :--- | :--- |
| ADD | $\mathrm{R} 1, @ \mathrm{R} 2$ | $\rightarrow$ | $\mathrm{R} 1=1 \mathrm{CH}, \mathrm{R} 2=03 \mathrm{H}$ |
| ADD | $01 \mathrm{H}, 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=24 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| ADD | $01 \mathrm{H}, @ 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=2 \mathrm{BH}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| ADD | $01 \mathrm{H}, \# 25 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=46 \mathrm{H}$ |

In the first example, destination working register R1 contains 12 H and the source working register R2 contains 03 H . The statement "ADD R1,R2" adds 03 H to 12 H , leaving the value 15 H in register R1.

## AND - Logical AND

## AND dst,src

Operation: dst $\leftarrow$ dst AND src
The source operand is logically ANDed with the destination operand. The result is stored in the destination. The AND operation results in a "1" bit being stored whenever the corresponding bits in the two operands are both logic ones; otherwise a " 0 " bit value is stored. The contents of the source are unaffected.

Flags: C: Unaffected.
Z: Set if the result is " 0 "; cleared otherwise.
$\mathbf{S}$ : Set if the result bit 7 is set; cleared otherwise.
V: Always cleared to "0".
D: Unaffected.
H: Unaffected.

## Format:

|  |  |  | Bytes | Cycles | Opcode (Hex) |  | ode $\underline{\text { srC }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst \| sr |  | 2 | 4 | 52 | $r$ | r |
|  |  |  |  | 6 | 53 | $r$ | Ir |
| opc | src | dst | 3 | 6 | 54 | R | R |
|  |  |  |  | 6 | 55 | R | IR |
| opc | dst | SrC | 3 | 6 | 56 | R | IM |

Examples: Given: R1 $=12 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$, register $01 \mathrm{H}=21 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$, register $03 \mathrm{H}=0 \mathrm{AH}$ :

| AND | $R 1, R 2$ | $\rightarrow$ | $R 1=02 H, R 2=03 H$ |
| :--- | :--- | :--- | :--- |
| AND | $R 1, @ R 2$ | $\rightarrow$ | $R 1=02 H, R 2=03 H$ |
| AND | $01 \mathrm{H}, 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=01 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| AND | $01 \mathrm{H}, @ 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=00 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| AND | $01 \mathrm{H}, \# 25 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=21 \mathrm{H}$ |

In the first example, destination working register R1 contains the value 12 H and the source working register R2 contains 03H. The statement "AND R1,R2" logically ANDs the source operand 03 H with the destination operand value 12 H , leaving the value 02 H in register R1.

## BAND - Bit AND

| BAND | $d s t, s r c . b$ |
| :--- | :--- |
| BAND | $d s t . b, s r c$ |

Operation: $\quad \operatorname{dst}(0) \leftarrow \operatorname{dst}(0)$ AND $\operatorname{src}(b)$
or
$\operatorname{dst}(\mathrm{b}) \leftarrow \operatorname{dst}(\mathrm{b})$ AND $\operatorname{src}(0)$
The specified bit of the source (or the destination) is logically ANDed with the zero bit (LSB) of the destination (or source). The resultant bit is stored in the specified bit of the destination. No other bits of the destination are affected. The source is unaffected.

Flags: $\quad \mathrm{C}$ : Unaffected.
Z: Set if the result is " 0 "; cleared otherwise.
S: Cleared to " 0 ".
V: Undefined.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | src |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst\|b|0 | src | 3 | 6 | 67 | rO | Rb |
| opc | src\|b|1 | dst | 3 | 6 | 67 | Rb | rO |

NOTE: In the second byte of the 3-byte instruction formats, the destination (or source) address is four bits, the bit address ' $b$ ' is three bits, and the LSB address value is one bit in length.

Examples: Given: R1 $=07 \mathrm{H}$ and register $01 \mathrm{H}=05 \mathrm{H}$ :
BAND R1,01H.1 $\rightarrow \quad \mathrm{R} 1=06 \mathrm{H}$, register $01 \mathrm{H}=05 \mathrm{H}$
BAND 01H.1,R1 $\rightarrow \quad$ Register 01H $=05 \mathrm{H}, \mathrm{R} 1=07 \mathrm{H}$
In the first example, source register 01 H contains the value 05 H (00000101B) and destination working register R1 contains 07H (00000111B). The statement "BAND R1,01H.1" ANDs the bit 1 value of the source register (" 0 ") with the bit 0 value of register R1 (destination), leaving the value 06H (00000110B) in register R1.

## BCP - Bit Compare

BCP dst,src.b
Operation: $\quad \operatorname{dst}(0)-\operatorname{src}(b)$
The specified bit of the source is compared to (subtracted from) bit zero (LSB) of the destination. The zero flag is set if the bits are the same; otherwise it is cleared. The contents of both operands are unaffected by the comparison.

Flags: C: Unaffected.
Z: Set if the two bits are the same; cleared otherwise.
S: Cleared to "0".
V: Undefined.
D: Unaffected.
H: Unaffected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | src |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | $\mathrm{dst}\|\mathrm{b}\| 0$ | src | 3 | 6 | 17 | rO | Rb |

NOTE: In the second byte of the instruction format, the destination address is four bits, the bit address ' b ' is three bits, and the LSB address value is one bit in length.

Example: Given: R1 $=07 \mathrm{H}$ and register $01 \mathrm{H}=01 \mathrm{H}$ :
BCP R1,01H. $1 \rightarrow$ R1 $=07 \mathrm{H}$, register $01 \mathrm{H}=01 \mathrm{H}$
If destination working register R1 contains the value 07 H (00000111B) and the source register 01 H contains the value $01 \mathrm{H}(00000001 \mathrm{~B})$, the statement "BCP R1,01H.1" compares bit one of the source register $(01 \mathrm{H})$ and bit zero of the destination register (R1). Because the bit values are not identical, the zero flag bit $(Z)$ is cleared in the FLAGS register (0D5H).

## BITC - Bit Complement

BITC dst.b
Operation: $\quad \operatorname{dst}(b) \leftarrow$ NOT dst(b)
This instruction complements the specified bit within the destination without affecting any other bits in the destination.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Cleared to "0".
V: Undefined.
D: Unaffected.
H: Unaffected.

## Format:

|  |  |  |  |  |  |  |  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | $\mathrm{dst}\|\mathrm{b}\| 0$ | 2 | 4 | 57 | rb |  |  |  |  |  |  |

NOTE: In the second byte of the instruction format, the destination address is four bits, the bit address 'b' is three bits, and the LSB address value is one bit in length.

Example: Given: R1 $=07 \mathrm{H}$
BITC R1.1 $\rightarrow \quad$ R1 $=05 \mathrm{H}$

If working register R1 contains the value 07H (00000111B), the statement "BITC R1.1" complements bit one of the destination and leaves the value 05H (00000101B) in register R1. Because the result of the complement is not " 0 ", the zero flag $(\mathrm{Z})$ in the FLAGS register (0D5H) is cleared.

## BITR — Bit Reset

## BITR dst.b

Operation: $\quad \operatorname{dst}(\mathrm{b}) \leftarrow 0$
The BITR instruction clears the specified bit within the destination without affecting any other bits in the destination.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | $\mathrm{dst}\|\mathrm{b}\| 0$ | 2 | 4 | 77 | rb |

NOTE: In the second byte of the instruction format, the destination address is four bits, the bit address 'b' is three bits, and the LSB address value is one bit in length.

Example: Given: R1 $=07 \mathrm{H}$ :
BITR R1.1 $\rightarrow \quad$ R1 $=05 \mathrm{H}$

If the value of working register R1 is $07 \mathrm{H}(00000111 \mathrm{~B})$, the statement "BITR R1.1" clears bit one of the destination register R1, leaving the value 05H (00000101B).

## BITS - Bit Set

BITS dst.b
Operation:
$\operatorname{dst}(\mathrm{b}) \leftarrow 1$
The BITS instruction sets the specified bit within the destination without affecting any other bits in the destination.

Flags: No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> opc $\mathrm{dst\|b\|1}$ | 2 |
| :---: | :---: | :---: | :---: | :---: | :---: |

NOTE: In the second byte of the instruction format, the destination address is four bits, the bit address ' b ' is three bits, and the LSB address value is one bit in length.

Example: Given: R1 $=07 \mathrm{H}:$
BITS R1.3 $\rightarrow \quad$ R1 $=0 F H$

If working register R1 contains the value 07H (00000111B), the statement "BITS R1.3" sets bit three of the destination register R1 to "1", leaving the value 0FH (00001111B).

## BOR - Bit OR

| BOR | dst,src.b |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| BOR | dst.b,src |  |  |  |  |
| Operation: | $\operatorname{dst}(0)$ | $\leftarrow$ | $\operatorname{dst}(0)$ | OR | $\operatorname{src}(b)$ |
|  |  | or |  |  |  |
|  |  | $\operatorname{dst}(b)$ | $\leftarrow$ | $\operatorname{dst}(b)$ | OR |$\quad \operatorname{src}(0)$

The specified bit of the source (or the destination) is logically ORed with bit zero (LSB) of the destination (or the source). The resulting bit value is stored in the specified bit of the destination. No other bits of the destination are affected. The source is unaffected.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Cleared to "0".
V: Undefined.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | src |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | $\mathrm{dst}\|\mathrm{b}\| 0$ | src |  | 3 | 6 | 07 | rO | Rb |
| opc | src\|b|1 | dst |  | 3 | 6 | 07 | Rb | rO |

NOTE: In the second byte of the 3-byte instruction formats, the destination (or source) address is four bits, the bit address ' b ' is three bits, and the LSB address value is one bit.

Examples: Given: R1 $=07 \mathrm{H}$ and register $01 \mathrm{H}=03 \mathrm{H}$ :
BOR R1, 01H. $1 \rightarrow \mathrm{R} 1=07 \mathrm{H}$, register $01 \mathrm{H}=03 \mathrm{H}$
BOR $01 \mathrm{H} .2, \mathrm{R} 1 \quad \rightarrow \quad$ Register $01 \mathrm{H}=07 \mathrm{H}, \mathrm{R} 1=07 \mathrm{H}$

In the first example, destination working register R1 contains the value 07H (00000111B) and source register 01 H the value 03 H ( 00000011 B ). The statement "BOR R1,01H.1" logically ORs bit one of register 01 H (source) with bit zero of R1 (destination). This leaves the same value (07H) in working register R1.

In the second example, destination register 01 H contains the value $03 \mathrm{H}(00000011 \mathrm{~B})$ and the source working register R1 the value 07H (00000111B). The statement "BOR 01H.2,R1" logically ORs bit two of register 01H (destination) with bit zero of R1 (source). This leaves the value 07H in register 01H.

## BTJRF - Bit Test, Jump Relative on False

BTJRF dst,src.b
Operation: If $\operatorname{src}(\mathrm{b})$ is a " 0 ", then $\mathrm{PC} \leftarrow \mathrm{PC}+\mathrm{dst}$
The specified bit within the source operand is tested. If it is a " 0 ", the relative address is added to the program counter and control passes to the statement whose address is now in the PC; otherwise, the instruction following the BTJRF instruction is executed.

Flags: $\quad$ No flags are affected.

## Format:

| $($ Note 1$)$ |  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

NOTE: In the second byte of the instruction format, the source address is four bits, the bit address 'b' is three bits, and the LSB address value is one bit in length.

Example: Given: R1 $=07 \mathrm{H}$ :
BTJRF SKIP,R1.3 $\quad \rightarrow \quad$ PC jumps to SKIP location
If working register R1 contains the value 07H (00000111B), the statement "BTJRF SKIP,R1.3" tests bit 3 . Because it is " 0 ", the relative address is added to the PC and the PC jumps to the memory location pointed to by the SKIP. (Remember that the memory location must be within the allowed range of +127 to -128 .)

## BTJRT — Bit Test, Jump Relative on True

BTJRT dst,src.b
Operation: If $\operatorname{src}(\mathrm{b})$ is a " 1 ", then $\mathrm{PC} \leftarrow \mathrm{PC}+\mathrm{dst}$
The specified bit within the source operand is tested. If it is a " 1 ", the relative address is added to the program counter and control passes to the statement whose address is now in the PC; otherwise, the instruction following the BTJRT instruction is executed.

Flags: No flags are affected.
Format:

|  | (Note 1) | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\frac{\text { src }}{}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

NOTE: In the second byte of the instruction format, the source address is four bits, the bit address 'b' is three bits, and the LSB address value is one bit in length.

Example: Given: R1 $=07 \mathrm{H}$ :
BTJRT SKIP,R1.1
If working register R1 contains the value 07H (00000111B), the statement "BTJRT SKIP,R1.1" tests bit one in the source register (R1). Because it is a "1", the relative address is added to the PC and the PC jumps to the memory location pointed to by the SKIP. (Remember that the memory location must be within the allowed range of +127 to -128 .)

## BXOR - Bit XOR

BXOR dst,src.b
BXOR dst.b,src

Operation: $\quad \operatorname{dst}(0) \leftarrow \operatorname{dst}(0) \quad$ XOR $\operatorname{src}(b)$
or
dst(b) $\leftarrow \operatorname{dst}(b) \quad$ XOR $\operatorname{src}(0)$
The specified bit of the source (or the destination) is logically exclusive-ORed with bit zero (LSB) of the destination (or source). The result bit is stored in the specified bit of the destination. No other bits of the destination are affected. The source is unaffected.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Cleared to " 0 ".
v: Undefined.
D: Unaffected.
H: Unaffected.

## Format:

|  |  |  | Bytes <br> 3 | Cycles <br> 6 | Opcode (Hex) | Addr Mode dst src |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst\|b|0 | src |  |  |  | r0 | Rb |
| opc | src\|b|1 | dst | 3 | 6 | 27 | Rb | ro |

NOTE: In the second byte of the 3-byte instruction formats, the destination (or source) address is four bits, the bit address ' b ' is three bits, and the LSB address value is one bit in length.

Examples: Given: R1 $=07 \mathrm{H}(00000111 \mathrm{~B})$ and register 01H $=03 \mathrm{H}(00000011 \mathrm{~B})$ :
BXOR R1,01H.1 $\rightarrow \quad$ R1 $=06 \mathrm{H}$, register 01H $=03 \mathrm{H}$
$\mathrm{BXOR} 01 \mathrm{H} .2, \mathrm{R} 1 \rightarrow$ Register $01 \mathrm{H}=07 \mathrm{H}, \mathrm{R} 1=07 \mathrm{H}$
In the first example, destination working register R1 has the value 07H (00000111B) and source register 01H has the value 03H (00000011B). The statement "BXOR R1,01H.1" exclusive-ORs bit one of register 01H (source) with bit zero of R1 (destination). The result bit value is stored in bit zero of R1, changing its value from 07 H to 06 H . The value of source register 01 H is unaffected.

## CALL - Call Procedure

| CALL | dst |  |  |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
| Operation: | SP | $\leftarrow$ | $\mathrm{SP}-1$ |
|  | $@ \mathrm{SP}$ | $\leftarrow$ | PCL |
|  | SP | $\leftarrow$ | $\mathrm{SP}-1$ |
|  | $@ \mathrm{SP}$ | $\leftarrow$ | PCH |
|  | PC | $\leftarrow$ | dst |

Flags: No flags are affected.
Format:
$\left.\begin{array}{|c|c|cccc} & \text { Bytes } & \text { Cycles } & \begin{array}{c}\text { Opcode } \\ \text { (Hex) } \\ \text { opc }\end{array} & \text { dst } & 3\end{array} \begin{array}{c}\text { Addr Mode } \\ \text { dst }\end{array}\right]$

Examples: Given: RO $=35 \mathrm{H}, \mathrm{R1}=21 \mathrm{H}, \mathrm{PC}=1 \mathrm{~A} 47 \mathrm{H}$, and $\mathrm{SP}=0002 \mathrm{H}$ :

```
CALL \(3521 \mathrm{H} \rightarrow \quad \mathrm{SP}=0000 \mathrm{H}\)
```

(Memory locations $0000 \mathrm{H}=1 \mathrm{AH}, 0001 \mathrm{H}=4 \mathrm{AH}$, where
4AH is the address that follows the instruction.)
CALL @RRO $\rightarrow \quad \mathrm{SP}=0000 \mathrm{H}(0000 \mathrm{H}=1 \mathrm{AH}, 0001 \mathrm{H}=49 \mathrm{H})$
CALL $\# 40 \mathrm{H} \rightarrow \mathrm{SP}=0000 \mathrm{H}(0000 \mathrm{H}=1 \mathrm{AH}, 0001 \mathrm{H}=49 \mathrm{H})$
In the first example, if the program counter value is 1 A 47 H and the stack pointer contains the value 0002 H , the statement "CALL 3521 H " pushes the current PC value onto the top of the stack. The stack pointer now points to memory location 0000H. The PC is then loaded with the value 3521 H , the address of the first instruction in the program sequence to be executed.

If the contents of the program counter and stack pointer are the same as in the first example, the statement "CALL @RR0" produces the same result except that the 49H is stored in stack location 0001 H (because the two-byte instruction format was used). The PC is then loaded with the value 3521 H , the address of the first instruction in the program sequence to be executed. Assuming that the contents of the program counter and stack pointer are the same as in the first example, if program address 0040 H contains 35 H and program address 0041 H contains 21 H , the statement "CALL \#40H" produces the same result as in the second example.

## CCF - Complement Carry Flag

## CCF

```
Operation: }\textrm{C}\leftarrow\textrm{NOT}
```

    The carry flag (C) is complemented. If \(C=" 1\) ", the value of the carry flag is changed to logic
    zero; if \(C=" 0\) ", the value of the carry flag is changed to logic one.
    Flags: C: Complemented.
No other flags are affected.

## Format:

| Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: |
| 1 | 4 | EF |

Example: Given: The carry flag $=$ " 0 ":
CCF
If the carry flag $=$ " 0 ", the CCF instruction complements it in the FLAGS register (0D5H), changing its value from logic zero to logic one.

## CLR-Clear

| CLR | dst |
| :--- | :--- |
| Operation: | dst $\leftarrow$ " $0 "$ |
|  | The destination location is cleared to "0". |
| Flags: | No flags are affected. |
| Format: |  |

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | BO | R |
|  |  | 4 | B 1 | IR |  |

Examples: Given: Register $00 \mathrm{H}=4 \mathrm{FH}$, register $01 \mathrm{H}=02 \mathrm{H}$, and register $02 \mathrm{H}=5 \mathrm{EH}$ :
$\begin{array}{lll}\text { CLR } 00 \mathrm{H} & \rightarrow & \text { Register } 00 \mathrm{H}=00 \mathrm{H} \\ \text { CLR } @ 01 \mathrm{H} & \rightarrow & \text { Register } 01 \mathrm{H}=02 \mathrm{H}, \text { register } 02 \mathrm{H}=00 \mathrm{H}\end{array}$

In Register (R) addressing mode, the statement "CLR 00 H " clears the destination register 00 H value to 00 H . In the second example, the statement "CLR @01H" uses Indirect Register (IR) addressing mode to clear the 02 H register value to 00 H .

## COM - Complement

## COM dst

Operation: dst $\leftarrow$ NOT dst
The contents of the destination location are complemented (one's complement); all "1s" are changed to " 0 s", and vice-versa.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Always reset to "0".
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | 60 | R |

Examples: Given: R1 $=07 \mathrm{H}$ and register $07 \mathrm{H}=0 \mathrm{~F} 1 \mathrm{H}$ :
$\mathrm{COM} \mathrm{R} 1 \rightarrow \mathrm{R} 1=0 \mathrm{~F} 8 \mathrm{H}$
COM @R1 $\rightarrow$ R1 $=07 \mathrm{H}$, register $07 \mathrm{H}=0 \mathrm{EH}$

In the first example, destination working register R1 contains the value 07H (00000111B). The statement "COM R1" complements all the bits in R1: all logic ones are changed to logic zeros, and vice-versa, leaving the value 0F8H (11111000B).

In the second example, Indirect Register (IR) addressing mode is used to complement the value of destination register 07H (11110001B), leaving the new value 0EH (00001110B).

## CP - Compare

## CP dst,src

Operation: dst - src
The source operand is compared to (subtracted from) the destination operand, and the appropriate flags are set accordingly. The contents of both operands are unaffected by the comparison.

Flags: $\quad$ C: Set if a "borrow" occurred (src > dst); cleared otherwise.
Z: Set if the result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred; cleared otherwise.
D: Unaffected.
H: Unaffected.
Format:

|  |  |  | Bytes | Cycles | Opcode (Hex) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst \| src |  | 2 | 4 | A2 | $r$ | $r$ |
|  |  |  |  | 6 | A3 | $r$ | Ir |
| opc | src | dst | 3 | 6 | A4 | R | R |
|  |  |  |  | 6 | A5 | R | IR |
| opc | dst | SrC | 3 | 6 | A6 | R | IM |

Examples: 1. Given: R1 $=02 \mathrm{H}$ and $\mathrm{R} 2=03 \mathrm{H}$ :

$$
\mathrm{CP} \quad \mathrm{R} 1, \mathrm{R} 2 \rightarrow \quad \text { Set the } \mathrm{C} \text { and } \mathrm{S} \text { flags }
$$

Destination working register R1 contains the value 02 H and source register R 2 contains the value 03H. The statement "CP R1,R2" subtracts the R2 value (source/subtrahend) from the R1 value (destination/minuend). Because a "borrow" occurs and the difference is negative, C and S are "1".
2. Given: R1 $=05 \mathrm{H}$ and $\mathrm{R} 2=0 \mathrm{AH}$ :

CP R1,R2
JP UGE,SKIP
INC R1
SKIP LD R3,R1

In this example, destination working register R1 contains the value 05 H which is less than the contents of the source working register R2 (OAH). The statement "CP R1,R2" generates C="1" and the JP instruction does not jump to the SKIP location. After the statement "LD R3,R1" executes, the value 06 H remains in working register R3.

## CPIJE - Compare, Increment, and Jump on Equal

## CPIJE dst,src,RA

Operation: If dst $-\mathrm{srC}=\mathrm{O} 0 \mathrm{D}, \mathrm{PC} \leftarrow \mathrm{PC}+\mathrm{RA}$
$\mathrm{Ir} \leftarrow \mathrm{Ir}+1$
The source operand is compared to (subtracted from) the destination operand. If the result is " 0 ", the relative address is added to the program counter and control passes to the statement whose address is now in the program counter. Otherwise, the instruction immediately following the CPIJE instruction is executed. In either case, the source pointer is incremented by one before the next instruction is executed.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

NOTE: Execution time is 18 cycles if the jump is taken or 16 cycles if it is not taken.

Example: Given: R1 $=02 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$, and register $03 \mathrm{H}=02 \mathrm{H}$ :
CPIJE R1,@R2,SKIP $\rightarrow$ R2 $=04 \mathrm{H}, \mathrm{PC}$ jumps to SKIP location

In this example, working register R1 contains the value 02 H , working register R2 the value 03 H , and register 03 contains 02 H . The statement "CPIJE R1,@R2,SKIP" compares the @R2 value $02 \mathrm{H}(00000010 \mathrm{~B})$ to $02 \mathrm{H}(00000010 \mathrm{~B})$. Because the result of the comparison is equal, the relative address is added to the PC and the PC then jumps to the memory location pointed to by SKIP. The source register (R2) is incremented by one, leaving a value of 04H. (Remember that the memory location must be within the allowed range of +127 to -128 .)

## CPIJNE - Compare, Increment, and Jump on Non-Equal

| CPIJNE | dst,src,RA |
| :--- | :--- |
| Operation: | If dst $-\operatorname{src} \quad$ "0", PC $\leftarrow \mathrm{PC}+\mathrm{RA}$ |
|  | Ir $\leftarrow$ Ir +1 |

The source operand is compared to (subtracted from) the destination operand. If the result is not " 0 ", the relative address is added to the program counter and control passes to the statement whose address is now in the program counter; otherwise the instruction following the CPIJNE instruction is executed. In either case the source pointer is incremented by one before the next instruction.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\frac{\text { src }}{}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

NOTE: Execution time is 18 cycles if the jump is taken or 16 cycles if it is not taken.

Example: Given: R1 $=02 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$, and register $03 \mathrm{H}=04 \mathrm{H}$ :
CPIJNER1,@R2,SKIP $\rightarrow$ R2 $=04 \mathrm{H}, \mathrm{PC}$ jumps to SKIP location

Working register R1 contains the value 02 H , working register R2 (the source pointer) the value 03 H , and general register 03 the value 04 H . The statement "CPIJNE R1,@R2,SKIP" subtracts $04 \mathrm{H}(00000100 \mathrm{~B})$ from $02 \mathrm{H}(00000010 \mathrm{~B})$. Because the result of the comparison is non-equal, the relative address is added to the PC and the PC then jumps to the memory location pointed to by SKIP. The source pointer register (R2) is also incremented by one, leaving a value of 04 H . (Remember that the memory location must be within the allowed range of +127 to -128 .)

## DA — Decimal Adjust

DA dst
Operation: dst $\leftarrow$ DA dst
The destination operand is adjusted to form two 4-bit BCD digits following an addition or subtraction operation. For addition (ADD, ADC) or subtraction (SUB, SBC), the following table indicates the operation performed. (The operation is undefined if the destination operand was not the result of a valid addition or subtraction of BCD digits):

| Instruction | Carry Before DA | Bits 4-7 <br> Value (Hex) | H Flag Before DA | Bits 0-3 <br> Value (Hex) | Number Added to Byte | Carry <br> After DA |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 0-9 | 0 | 0-9 | 00 | 0 |
|  | 0 | 0-8 | 0 | A-F | 06 | 0 |
|  | 0 | 0-9 | 1 | 0-3 | 06 | 0 |
| ADD | 0 | A-F | 0 | 0-9 | 60 | 1 |
| ADC | 0 | 9-F | 0 | A-F | 66 | 1 |
|  | 0 | A-F | 1 | 0-3 | 66 | 1 |
|  | 1 | 0-2 | 0 | 0-9 | 60 | 1 |
|  | 1 | 0-2 | 0 | A-F | 66 | 1 |
|  | 1 | 0-3 | 1 | 0-3 | 66 | 1 |
|  | 0 | 0-9 | 0 | 0-9 | $00=-00$ | 0 |
| SUB | 0 | 0-8 | 1 | 6-F | $\mathrm{FA}=-06$ | 0 |
| SBC | 1 | 7-F | 0 | 0-9 | A0 $=-60$ | 1 |
|  | 1 | 6-F | 1 | 6-F | $9 \mathrm{~A}=-66$ | 1 |

Flags: $\quad$ C: Set if there was a carry from the most significant bit; cleared otherwise (see table).
Z: Set if result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if result bit 7 is set; cleared otherwise.
V: Undefined.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | 40 | R |

## DA - Decimal Adjust

DA (Continued)
Example: Given: Working register R0 contains the value 15 (BCD), working register R1 contains 27 (BCD), and address 27 H contains 46 (BCD):
$\begin{array}{llll}\text { ADD } & \mathrm{R} 1, \mathrm{RO} & ; & \mathrm{C} \leftarrow " 0 ", \mathrm{H} \leftarrow " 0 ", \text { Bits } 4-7=3 \text {, bits } 0-3=\mathrm{C}, \mathrm{R} 1 \leftarrow 3 \mathrm{CH} \\ \text { DA } & \mathrm{R} 1 & ; & \mathrm{R} 1 \leftarrow 3 \mathrm{CH}+06\end{array}$

If addition is performed using the BCD values 15 and 27 , the result should be 42 . The sum is incorrect, however, when the binary representations are added in the destination location using standard binary arithmetic:

| 0001 | 0101 | 15 |
| ---: | :--- | :--- |
| +0010 | 0111 | 27 |
| 0011 | $1100=$ | 3 CH |

The DA instruction adjusts this result so that the correct BCD representation is obtained:

| 0011 |
| ---: |
| +0000 |
| 0100 |
| 0110010 |$=42$

Assuming the same values given above, the statements
SUB 27H,RO;
$\mathrm{C} \leftarrow$ " 0 ", $\mathrm{H} \leftarrow$ " 0 ", Bits $4-7=3$, bits $0-3=1$
DA @R1 ;
$@ R 1 \leftarrow 31-0$
leave the value 31 (BCD) in address 27H (@R1).

## DEC - Decrement

## DEC dst

Operation: dst $\leftarrow d s t-1$
The contents of the destination operand are decremented by one.
Flags: $\quad \mathrm{C}:$ Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Set if result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred; cleared otherwise.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | 00 | R |

Examples: Given: R1 $=03 \mathrm{H}$ and register $03 \mathrm{H}=10 \mathrm{H}$ :
DEC R1 $\rightarrow \quad \mathrm{R} 1=02 \mathrm{H}$
DEC @R1 $\rightarrow$ Register 03H $=0 \mathrm{FH}$

In the first example, if working register R1 contains the value 03H, the statement "DEC R1" decrements the hexadecimal value by one, leaving the value 02 H . In the second example, the statement "DEC @R1" decrements the value 10H contained in the destination register 03 H by one, leaving the value 0FH.

## DECW - Decrement Word

DECW dst
Operation: dst $\leftarrow$ dst - 1
The contents of the destination location (which must be an even address) and the operand following that location are treated as a single 16-bit value that is decremented by one.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred; cleared otherwise.
D: Unaffected.
H: Unaffected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 8 | 80 | RR |

Examples: Given: R0 $=12 \mathrm{H}, \mathrm{R} 1=34 \mathrm{H}, \mathrm{R} 2=30 \mathrm{H}$, register $30 \mathrm{H}=0 \mathrm{FH}$, and register $31 \mathrm{H}=21 \mathrm{H}$ :
DECW RRO $\rightarrow \quad$ R0 $=12 \mathrm{H}, \mathrm{R} 1=33 \mathrm{H}$
DECW @R2 $\rightarrow$ Register 30H $=0 \mathrm{FH}$, register 31H $=20 \mathrm{H}$

In the first example, destination register R0 contains the value 12H and register R1 the value 34H. The statement "DECW RRO" addresses R0 and the following operand R1 as a 16-bit word and decrements the value of R1 by one, leaving the value 33 H .

NOTE: A system malfunction may occur if you use a Zero flag (FLAGS.6) result together with a DECW instruction. To avoid this problem, we recommend that you use DECW as shown in the following example:

LOOP: DECW RRO
LD R2,R1
OR R2,R0
JR NZ,LOOP

## DI — Disable Interrupts

DI
Operation: $\quad \mathrm{SYM}(0) \leftarrow 0$
Bit zero of the system mode control register, SYM. 0 , is cleared to " 0 ", globally disabling all interrupt processing. Interrupt requests will continue to set their respective interrupt pending bits, but the CPU will not service them while interrupt processing is disabled.

Flags: $\quad$ No flags are affected.
Format:

| Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: |
| 1 | 4 | $8 F$ |

Example: Given: SYM $=01 \mathrm{H}$ :
DI
If the value of the SYM register is 01 H , the statement "DI" leaves the new value 00 H in the register and clears SYM. 0 to "0", disabling interrupt processing.

Before changing IMR, interrupt pending and interrupt source control register, be sure DI state.

## DIV — Divide (Unsigned)

## DIV dst,src

Operation: dst $\div$ src
dst (UPPER) $\leftarrow$ REMAINDER
dst (LOWER) $\leftarrow$ QUOTIENT
The destination operand (16 bits) is divided by the source operand ( 8 bits). The quotient ( 8 bits) is stored in the lower half of the destination. The remainder (8 bits) is stored in the upper half of the destination. When the quotient is $\geq 2^{8}$, the numbers stored in the upper and lower halves of the destination for quotient and remainder are incorrect. Both operands are treated as unsigned integers.

Flags: $\quad$ C: Set if the $V$ flag is set and quotient is between $2^{8}$ and $2^{9}-1$; cleared otherwise.
Z: Set if divisor or quotient $=$ " 0 "; cleared otherwise.
S: Set if MSB of quotient = "1"; cleared otherwise.
V: Set if quotient is $\geq 2^{8}$ or if divisor $=\quad " 0$ "; cleared otherwise.
D: Unaffected.
H: Unaffected.
Format:

|  |  |  | Bytes | Cycles |  | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

NOTE: Execution takes 10 cycles if the divide-by-zero is attempted; otherwise it takes 26 cycles.

Examples: Given: RO $=10 \mathrm{H}, \mathrm{R} 1=03 \mathrm{H}, \mathrm{R} 2=40 \mathrm{H}$, register $40 \mathrm{H}=80 \mathrm{H}$ :

| DIV | RR0,R2 | $\rightarrow$ | $R 0=03 H, R 1=40 H$ |
| :--- | :--- | :--- | :--- |
| DIV | $R R 0, @ R 2$ | $\rightarrow$ | $R 0=03 H, R 1=20 H$ |
| DIV | $R R 0, \# 20 H$ | $\rightarrow$ | $R 0=03 H, R 1=80 H$ |

In the first example, destination working register pair RR0 contains the values 10H (R0) and 03H (R1), and register R2 contains the value 40H. The statement "DIV RR0,R2" divides the 16-bit RR0 value by the 8-bit value of the R2 (source) register. After the DIV instruction, R0 contains the value 03 H and R 1 contains 40 H . The 8 -bit remainder is stored in the upper half of the destination register RR0 (R0) and the quotient in the lower half (R1).

## DJNZ - Decrement and Jump if Non-Zero

DJNZ r,dst
Operation: $\quad r \leftarrow r-1$
If $\mathrm{r} \neq 0, \mathrm{PC} \leftarrow \mathrm{PC}+\mathrm{dst}$
The working register being used as a counter is decremented. If the contents of the register are not logic zero after decrementing, the relative address is added to the program counter and control passes to the statement whose address is now in the PC. The range of the relative address is +127 to -128 , and the original value of the PC is taken to be the address of the instruction byte following the DJNZ statement.

NOTE: In case of using DJNZ instruction, the working register being used as a counter should be set at the one of location 0 OCOH to 0 CFH with SRP, SRP0, or SRP1 instruction.

Flags: $\quad$ No flags are affected.

## Format:

|  |  | Bytes | Cycles | Opcode (Hex) | Addr Mode dst |
| :---: | :---: | :---: | :---: | :---: | :---: |
| r \| opc | dst | 2 | 8 (jump taken) | rA | RA |
|  |  |  | 8 (no jump) | $r=0$ to F |  |

Example: Given: R1 $=02 \mathrm{H}$ and LOOP is the label of a relative address:
SRP\#OCOH

DJNZ R1,LOOP

DJNZ is typically used to control a "loop" of instructions. In many cases, a label is used as the destination operand instead of a numeric relative address value. In the example, working register R1 contains the value 02 H , and LOOP is the label for a relative address.

The statement "DJNZ R1, LOOP" decrements register R1 by one, leaving the value 01H. Because the contents of R1 after the decrement are non-zero, the jump is taken to the relative address specified by the LOOP label.

## EI - Enable Interrupts

El
Operation: $\quad$ SYM $(0) \leftarrow 1$
An El instruction sets bit zero of the system mode register, SYM. 0 to "1". This allows interrupts to be serviced as they occur (assuming they have highest priority). If an interrupt's pending bit was set while interrupt processing was disabled (by executing a DI instruction), it will be serviced when you execute the El instruction.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 4 | $9 F$ |

Example: Given: SYM $=00 \mathrm{H}$ :
El
If the SYM register contains the value 00 H , that is, if interrupts are currently disabled, the statement "El" sets the SYM register to 01 H , enabling all interrupts. (SYM. 0 is the enable bit for global interrupt processing.)

## ENTER - Enter

## ENTER

Operation: $\mathrm{SP} \quad \leftarrow \quad \mathrm{SP}-2$
$@$ SP $\leftarrow \quad \mathrm{IP}$
$\mathrm{IP} \leftarrow \mathrm{PC}$
$\mathrm{PC} \quad \leftarrow \quad$ @IP
$\mathrm{IP} \quad \leftarrow \quad \mathrm{IP}+2$
This instruction is useful when implementing threaded-code languages. The contents of the instruction pointer are pushed to the stack. The program counter (PC) value is then written to the instruction pointer. The program memory word that is pointed to by the instruction pointer is loaded into the PC, and the instruction pointer is incremented by two.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: | :---: |
| opc | 1 | 14 | 1 F |

Example: The diagram below shows one example of how to use an ENTER statement.

## EXIT-Exit

EXIT

| Operation: | IP | $\leftarrow$ | $@ \mathrm{SP}$ |
| :--- | :--- | :--- | :--- |
|  | SP | $\leftarrow$ | $\mathrm{SP}+2$ |
|  | PC | $\leftarrow$ | $@ \mathrm{IP}$ |
|  | IP | $\leftarrow$ | $\mathrm{IP}+2$ |

This instruction is useful when implementing threaded-code languages. The stack value is popped and loaded into the instruction pointer. The program memory word that is pointed to by the instruction pointer is then loaded into the program counter, and the instruction pointer is incremented by two.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 14 (internal stack) | 2 F |
|  |  | 16 (internal stack) |  |

Example: The diagram below shows one example of how to use an EXIT statement.

## IDLE - Idle Operation

IDLE
Operation:
The IDLE instruction stops the CPU clock while allowing system clock oscillation to continue. Idle mode can be released by an interrupt request (IRQ) or an external reset operation.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |

| Example: $\quad$ The instruction |  |
| :--- | :--- |
| IDLE |  |
|  | stops the CPU clock but not the system clock. |

## INC - Increment

## INC dst

Operation: $\quad$ dst $\leftarrow d s t+1$
The contents of the destination operand are incremented by one.
Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred; cleared otherwise.
D: Unaffected.
H: Unaffected.
Format:

|  |  | Bytes | Cycles | Opcode (Hex) | Addr Mode dst |
| :---: | :---: | :---: | :---: | :---: | :---: |
| dst \| opc |  | 1 | 4 | rE | $r$ |
|  |  |  |  | $r=0$ to F |  |
| opc | dst | 2 | 4 | 20 | R |
|  |  |  | 4 | 21 | IR |

Examples: Given: $\mathrm{RO}=1 \mathrm{BH}$, register $00 \mathrm{H}=0 \mathrm{CH}$, and register $1 \mathrm{BH}=0 \mathrm{FH}$ :
INC RO $\rightarrow \quad$ RO $=1 \mathrm{CH}$
INC $00 \mathrm{H} \rightarrow$ Register $00 \mathrm{H}=0 \mathrm{DH}$
INC @RO $\rightarrow$ RO $=1 \mathrm{BH}$, register 01H $=10 \mathrm{H}$

In the first example, if destination working register R0 contains the value 1 BH , the statement "INC R0" leaves the value 1CH in that same register.

The next example shows the effect an INC instruction has on register 00 H , assuming that it contains the value 0 CH .

In the third example, INC is used in Indirect Register (IR) addressing mode to increment the value of register 1 BH from 0 FH to 10 H .

## INCW - Increment Word

## INCW dst

Operation: dst $\leftarrow$ dst +1
The contents of the destination (which must be an even address) and the byte following that location are treated as a single 16 -bit value that is incremented by one.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred; cleared otherwise.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 8 | $\mathrm{A0}$ | RR |

Examples: Given: R0 $=1 \mathrm{AH}, \mathrm{R1}=02 \mathrm{H}$, register $02 \mathrm{H}=0 \mathrm{FH}$, and register $03 \mathrm{H}=0 \mathrm{FFH}$ :
INCW RRO $\rightarrow \quad$ RO $=1 \mathrm{AH}, \mathrm{R1}=03 \mathrm{H}$
INCW @R1 $\rightarrow$ Register 02H $=10 \mathrm{H}$, register 03H $=00 \mathrm{H}$

In the first example, the working register pair RR0 contains the value 1AH in register R0 and 02H in register R1. The statement "INCW RR0" increments the 16-bit destination by one, leaving the value 03 H in register R1. In the second example, the statement "INCW @R1" uses Indirect Register (IR) addressing mode to increment the contents of general register 03H from 0FFH to 00 H and register 02 H from 0 FH to 10 H .

NOTE: A system malfunction may occur if you use a Zero (Z) flag (FLAGS.6) result together with an INCW instruction. To avoid this problem, we recommend that you use INCW as shown in the following example:

LOOP: INCW RR0

| LD | R2,R1 |
| :--- | :--- |
| OR | R2,R0 |
| JR | NZ, |

## IRET - Interrupt Return

| IRET | IRET (Normal) | IRET (Fast) |  |
| :---: | :---: | :---: | :---: |
| Operation: | FLAGS $\leftarrow$ @SP | $\mathrm{PC} \leftrightarrow \mathrm{IP}$ |  |
|  | $\mathrm{SP} \leftarrow \mathrm{SP}+1$ | FLAGS $\leftarrow$ | FLAGS' |
|  | $\mathrm{PC} \leftarrow$ @SP | FIS $\leftarrow 0$ |  |
|  | $\mathrm{SP} \leftarrow \mathrm{SP}+2$ |  |  |
|  | $\mathrm{SYM}(0) \leftarrow 1$ |  |  |

This instruction is used at the end of an interrupt service routine. It restores the flag register and the program counter. It also re-enables global interrupts. A "normal IRET" is executed only if the fast interrupt status bit (FIS, bit one of the FLAGS register, 0D5H) is cleared ( $=$ " 0 "). If a fast interrupt occurred, IRET clears the FIS bit that was set at the beginning of the service routine.

Flags: $\quad$ All flags are restored to their original settings (that is, the settings before the interrupt occurred).
Format:

| IRET <br> (Normal) | Bytes | Cycles | Opcode (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 10 (internal stack) <br> 12 (internal stack) | BF |
| IRET <br> (Fast) | Bytes | Cycles | Opcode (Hex) |
| opc | 1 | 6 | $B F$ |

Example: In the figure below, the instruction pointer is initially loaded with 100 H in the main program before interrupts are enabled. When an interrupt occurs, the program counter and instruction pointer are swapped. This causes the PC to jump to address 100 H and the IP to keep the return address. The last instruction in the service routine normally is a jump to IRET at address FFH. This causes the instruction pointer to be loaded with 100 H "again" and the program counter to jump back to the main program. Now, the next interrupt can occur and the IP is still correct at 100 H .

NOTE: In the fast interrupt example above, if the last instruction is not a jump to IRET, you must pay attention to the order of the last two instructions. The IRET cannot be immediately proceeded by a clearing of the interrupt status (as with a reset of the IPR register).

## JP - Jump

| JP | cc,dst | (Conditional) |
| :--- | :--- | :--- |
| JP | dst | (Unconditional) |

Operation: If cc is true, PC $\leftarrow$ dst
The conditional JUMP instruction transfers program control to the destination address if the condition specified by the condition code (cc) is true; otherwise, the instruction following the JP instruction is executed. The unconditional JP simply replaces the contents of the PC with the contents of the specified register pair. Control then passes to the statement addressed by the PC.

Flags: $\quad$ No flags are affected.
Format: (1)

| (2) |  | Bytes | Cycles | Opcode (Hex) | Addr Mode dst |
| :---: | :---: | :---: | :---: | :---: | :---: |
| cc \| opc | dst | 3 | 8 | ccD | DA |
|  |  |  |  | $\mathrm{cc}=0$ to F |  |
| opc | dst | 2 | 8 | 30 | IRR |

## NOTES:

1. The 3-byte format is used for a conditional jump and the 2-byte format for an unconditional jump.
2. In the first byte of the three-byte instruction format (conditional jump), the condition code and the opcode are both four bits.

Examples: Given: The carry flag $(C)=" 1 "$, register $00=01 \mathrm{H}$, and register $01=20 \mathrm{H}$ :

$$
\begin{array}{llll}
\mathrm{JP} & \mathrm{C}, \mathrm{LABEL}, \mathrm{~W} & \rightarrow & \text { LABEL_W }=1000 \mathrm{H}, \mathrm{PC}=1000 \mathrm{H} \\
\mathrm{JP} & @ 00 \mathrm{H} & \rightarrow \quad \mathrm{PC}=0120 \mathrm{H}
\end{array}
$$

The first example shows a conditional JP. Assuming that the carry flag is set to " 1 ", the statement "JP C,LABEL_W" replaces the contents of the PC with the value 1000 H and transfers control to that location. Had the carry flag not been set, control would then have passed to the statement immediately following the JP instruction.

The second example shows an unconditional JP. The statement "JP @00" replaces the contents of the PC with the contents of the register pair 00 H and 01 H , leaving the value 0120 H .

## JR - Jump Relative

JR cc,dst
Operation: If cc is true, $\mathrm{PC} \leftarrow \mathrm{PC}+\mathrm{dst}$
If the condition specified by the condition code (cc) is true, the relative address is added to the program counter and control passes to the statement whose address is now in the program counter; otherwise, the instruction following the JR instruction is executed. (See list of condition codes).

The range of the relative address is $+127,-128$, and the original value of the program counter is taken to be the address of the first instruction byte following the JR statement.

Flags: $\quad$ No flags are affected.

## Format:

| (1) |  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| cc | opc | dst |  | 2 | 6 | ccB |$\quad$| RA |
| :--- |

NOTE: In the first byte of the two-byte instruction format, the condition code and the opcode are each four bits.

Example: Given: The carry flag = "1" and LABEL_X = 1FF7H:
JR

$$
\mathrm{C}, \mathrm{LABEL} \_\mathrm{X} \rightarrow \mathrm{PC}=1 \mathrm{FF} 7 \mathrm{H}
$$

If the carry flag is set (that is, if the condition code is true), the statement "JR C,LABEL_X" will pass control to the statement whose address is now in the PC. Otherwise, the program instruction following the JR would be executed.

## LD - Load

LD dst,src
Operation:
dst $\leftarrow$ src
The contents of the source are loaded into the destination. The source's contents are unaffected.
Flags: $\quad$ No flags are affected.

## Format:

## LD - Load

LD (Continued)
Examples: Given: R0 $=01 \mathrm{H}, \mathrm{R} 1=0 \mathrm{AH}$, register $00 \mathrm{H}=01 \mathrm{H}$, register $01 \mathrm{H}=20 \mathrm{H}$, register $02 \mathrm{H}=02 \mathrm{H}$, LOOP $=30 \mathrm{H}$, and register $3 \mathrm{AH}=0 F F H$ :

| LD | $\mathrm{RO}, \mathrm{\# 10H} \rightarrow$ | $\mathrm{RO}=10 \mathrm{H}$ |
| :---: | :---: | :---: |
| LD | $\mathrm{R0}, 01 \mathrm{H} \rightarrow$ | $\mathrm{RO}=20 \mathrm{H}$, register $01 \mathrm{H}=20 \mathrm{H}$ |
| LD | 01H,R0 $\rightarrow$ | Register 01H $=01 \mathrm{H}, \mathrm{R0} 001 \mathrm{H}$ |
| LD | R1,@R0 $\rightarrow$ | $\mathrm{R} 1=20 \mathrm{H}, \mathrm{R0}=01 \mathrm{H}$ |
| LD | @R0,R1 $\rightarrow$ | $\mathrm{R0}=01 \mathrm{H}, \mathrm{R1}=0 \mathrm{AH}$, register $01 \mathrm{H}=0 \mathrm{AH}$ |
| LD | $00 \mathrm{H}, 01 \mathrm{H} \rightarrow$ | Register $00 \mathrm{H}=20 \mathrm{H}$, register $01 \mathrm{H}=20 \mathrm{H}$ |
| LD | 02H,@00H $\rightarrow$ | Register $02 \mathrm{H}=20 \mathrm{H}$, register $00 \mathrm{H}=01 \mathrm{H}$ |
| LD | OOH,\#OAH $\rightarrow$ | Register $00 \mathrm{H}=0 \mathrm{AH}$ |
| LD | $@ 00 \mathrm{H}, \# 10 \mathrm{H} \rightarrow$ | Register $00 \mathrm{H}=01 \mathrm{H}$, register $01 \mathrm{H}=10 \mathrm{H}$ |
| LD | @00H, $02 \mathrm{H} \rightarrow$ | Register $00 \mathrm{H}=01 \mathrm{H}$, register $01 \mathrm{H}=02$, register $02 \mathrm{H}=02 \mathrm{H}$ |
| LD | R0,\#LOOP[R1] $\rightarrow$ | R0 $=0 F F H, \mathrm{R} 1=0 \mathrm{AH}$ |
| LD | \#LOOP[R0],R1 $\rightarrow$ | Register $31 \mathrm{H}=0 \mathrm{AH}, \mathrm{R0}=01 \mathrm{H}, \mathrm{R} 1=0 \mathrm{AH}$ |

## LDB-Load Bit

## LDB dst,src.b

LDB dst.b,src
Operation: $\quad \operatorname{dst}(0) \leftarrow \operatorname{src}(b)$
or
dst(b) $\leftarrow \operatorname{src}(0)$
The specified bit of the source is loaded into bit zero (LSB) of the destination, or bit zero of the source is loaded into the specified bit of the destination. No other bits of the destination are affected. The source is unaffected.

Flags: No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | src |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst\|b|0 | src | 3 | 6 | 47 | rO | Rb |
| opc | src\|b|1 | dst | 3 | 6 | 47 | Rb | rO |

NOTE: In the second byte of the instruction formats, the destination (or source) address is four bits, the bit address ' $b$ ' is three bits, and the LSB address value is one bit in length.

Examples: Given: R0 $=06 \mathrm{H}$ and general register $00 \mathrm{H}=05 \mathrm{H}$ :

$$
\begin{array}{llll}
\text { LDB } & \mathrm{R} 0,00 \mathrm{H} .2 & \rightarrow & \mathrm{RO}=07 \mathrm{H}, \text { register } 00 \mathrm{H}=05 \mathrm{H} \\
\text { LDB } & 00 \mathrm{H} .0, \mathrm{RO} & \rightarrow & \mathrm{RO}=06 \mathrm{H}, \text { register } 00 \mathrm{H}=04 \mathrm{H}
\end{array}
$$

In the first example, destination working register R 0 contains the value 06 H and the source general register 00 H the value 05 H . The statement "LD R0,00H.2" loads the bit two value of the 00 H register into bit zero of the R0 register, leaving the value 07H in register R0.

In the second example, 00 H is the destination register. The statement "LD 00H.0,R0" loads bit zero of register R0 to the specified bit (bit zero) of the destination register, leaving 04H in general register 00 H .

## LDC/LDE - Load Memory

LDC/LDE dst,src
Operation: dst $\leftarrow$ src
This instruction loads a byte from program or data memory into a working register or vice-versa. The source values are unaffected. LDC refers to program memory and LDE to data memory. The assembler makes 'Irr' or 'rr' values an even number for program memory and odd an odd number for data memory.

Flags: No flags are affected.
Format:

|  |  |  |  |  | Bytes | Cycles | Opcode (Hex) | Addr dst | Mode src |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | opc | dst \\| src |  |  | 2 | 10 | C3 | $r$ | Irr |
| 2. | opc | src \| dst |  |  | 2 | 10 | D3 | Irr | $r$ |
| 3. | opc | dst \\| src | XS |  | 3 | 12 | E7 | $r$ | XS [rr] |
| 4. | opc | src \| dst | XS |  | 3 | 12 | F7 | XS [rr] | r |
| 5. | opc | dst \\| src | XL ${ }_{\text {L }}$ | $\mathrm{XL}_{\mathrm{H}}$ | 4 | 14 | A7 | $r$ | XL [rr] |
| 6. | opc | src \| dst | XL ${ }_{\text {L }}$ | $\mathrm{XL}_{\mathrm{H}}$ | 4 | 14 | B7 | XL [rr] | r |
| 7. | opc | dst \| 0000 | DA ${ }_{L}$ | $\mathrm{DA}_{\mathrm{H}}$ | 4 | 14 | A7 | $r$ | DA |
| 8. | opc | src \| 0000 | DA ${ }_{\text {L }}$ | $\mathrm{DA}_{\mathrm{H}}$ | 4 | 14 | B7 | DA | r |
| 9. | opc | dst \| 0001 | DA ${ }_{\text {L }}$ | $\mathrm{DA}_{\mathrm{H}}$ | 4 | 14 | A7 | $r$ | DA |
| 0. | opc | src \| 0001 | DA ${ }_{\text {L }}$ | $\mathrm{DA}_{\mathrm{H}}$ | 4 | 14 | B7 | DA | $r$ |

## NOTES

1. The source (src) or working register pair [rr] for formats 5 and 6 cannot use register pair 0-1.
2. For formats 3 and 4, the destination address 'XS [rr]' and the source address 'XS [rr]' are each one byte.
3. For formats 5 and 6, the destination address ' $\mathrm{XL}[\mathrm{rr}]$ and the source address ' XL [rr]' are each two bytes.
4. The DA and $r$ source values for formats 7 and 8 are used to address program memory; the second set of values, used in formats 9 and 10 , are used to address data memory.

## LDC/LDE - Load Memory

| LDC/LDE | (Continued) |  |  |
| :---: | :---: | :---: | :---: |
| Examples: | Given: R0 $=11 \mathrm{H}, \mathrm{R} 1=34 \mathrm{H}, \mathrm{R} 2=01 \mathrm{H}, \mathrm{R} 3=04 \mathrm{H}$; Program memory locations $0103 \mathrm{H}=4 \mathrm{FH}, 0104 \mathrm{H}=1 \mathrm{~A}, 0105 \mathrm{H}=6 \mathrm{DH}$, and $1104 \mathrm{H}=88 \mathrm{H}$. External data memory locations $0103 \mathrm{H}=5 \mathrm{FH}, 0104 \mathrm{H}=2 \mathrm{AH}, 0105 \mathrm{H}=7 \mathrm{DH}$, and $1104 \mathrm{H}=98 \mathrm{H}$ : |  |  |
|  | LDC | R0,@RR2 | $\mathrm{RO}=$ contents of program memory location 0104 H $\mathrm{RO}=1 \mathrm{AH}, \mathrm{R} 2=01 \mathrm{H}, \mathrm{R} 3=04 \mathrm{H}$ |
|  | LDE | R0,@RR2 | $\begin{aligned} & \mathrm{RO} \leftrightarrows \text { contents of external data memory location } 0104 \mathrm{H} \\ & \mathrm{RO}=2 \mathrm{AH}, \mathrm{R} 2=01 \mathrm{H}, \mathrm{R} 3=04 \mathrm{H} \end{aligned}$ |
|  | LDC (note) | @RR2,Ro | 11 H (contents of R0) is loaded into program memory location 0104H (RR2), <br> working registers R0, R2, R3 $\rightarrow$ no change |
|  | LDE | @RR2,R0 | 11 H (contents of R0) is loaded into external data memory location 0104H (RR2), <br> working registers R0, R2, R3 $\rightarrow$ no change |
|  | LDC | R0,\#01H[RR2] | RO $\leftarrow$ contents of program memory location 0105H (01H + RR2), <br> ; RO $=6 D H, R 2=01 H, R 3=04 H$ |
|  | LDE | R0,\#01H[RR2] | R0 $\leftarrow$ contents of external data memory location 0105H <br> $(01 \mathrm{H}+\mathrm{RR} 2), \mathrm{RO}=7 \mathrm{DH}, \mathrm{R} 2=01 \mathrm{H}, \mathrm{R} 3=04 \mathrm{H}$ |
|  | LDC (note) | \#01H[RR2],R0 | 11 H (contents of RO ) is loaded into program memory location $0105 \mathrm{H}(01 \mathrm{H}+0104 \mathrm{H})$ |
|  | LDE | \#01H[RR2],R0 | 11 H (contents of R0) is loaded into external data memory location 0105H $(01 \mathrm{H}+0104 \mathrm{H})$ |
|  | LDC | R0,\#1000H[RR2] | R0 $\leftarrow$ contents of program memory location 1104 H $(1000 \mathrm{H}+0104 \mathrm{H}), \mathrm{RO}=88 \mathrm{H}, \mathrm{R} 2=01 \mathrm{H}, \mathrm{R} 3=04 \mathrm{H}$ |
|  | LDE | R0,\#1000H[RR2] | RO $\leftarrow$ contents of external data memory location 1104 H $(1000 \mathrm{H}+0104 \mathrm{H}), \mathrm{RO}=98 \mathrm{H}, \mathrm{R} 2=01 \mathrm{H}, \mathrm{R} 3=04 \mathrm{H}$ |
|  | $\begin{aligned} & \text { LDC } \\ & 88 \mathrm{H} \end{aligned}$ | R0,1104H | R0 $\leftarrow$ contents of program memory location 1104H, R0 = |
|  | LDE | R0,1104H | $\begin{aligned} & \mathrm{RO}=\text { contents of external data memory location } 1104 \mathrm{H}, \\ & \mathrm{RO}=98 \mathrm{H} \end{aligned}$ |
|  | LDC (note) | ) $1105 \mathrm{H}, \mathrm{RO}$ | 11 H (contents of RO ) is loaded into program memory location $1105 \mathrm{H},(1105 \mathrm{H}) \leftarrow 11 \mathrm{H}$ |
|  | LDE | 1105H,R0 | 11 H (contents of R 0 ) is loaded into external data memory <br> location $1105 \mathrm{H},(1105 \mathrm{H}) \leftarrow 11 \mathrm{H}$ |

NOTE: These instructions are not supported by masked ROM type devices.

## LDCD/LDED - Load Memory and Decrement

LDCD/LDED dst,src
Operation: dst $\leftarrow \mathrm{src}$
$\mathrm{rr} \leftarrow \mathrm{rr}-1$
These instructions are used for user stacks or block transfers of data from program or data memory to the register file. The address of the memory location is specified by a working register pair. The contents of the source location are loaded into the destination location. The memory address is then decremented. The contents of the source are unaffected.

LDCD references program memory and LDED references external data memory. The assembler makes 'Irr' an even number for program memory and an odd number for data memory.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |

Examples: Given: R6 $=10 \mathrm{H}, \mathrm{R} 7=33 \mathrm{H}, \mathrm{R} 8=12 \mathrm{H}$, program memory location $1033 \mathrm{H}=0 \mathrm{CDH}$, and external data memory location 1033H $=$ 0DDH:

LDCD R8,@RR6 ; OCDH (contents of program memory location 1033H) is loaded
; into R8 and RR6 is decremented by one
; R8 = 0CDH, R6 = 10H,R7 = 32H (RR6 $\leftarrow \mathrm{RR} 6-1)$

LDED R8,@RR6 ; ODDH (contents of data memory location 1033H) is loaded
; into R8 and RR6 is decremented by one (RR6 $\leftarrow$ RR6 - 1)
; R8 = 0DDH, R6 $=10 \mathrm{H}, \mathrm{R} 7=32 \mathrm{H}$

## LDCI/LDEI — Load Memory and Increment

## LDCI/LDEI dst,src

Operation: dst $\leftarrow$ src
$\mathrm{rr} \leftarrow \mathrm{rr}+1$
These instructions are used for user stacks or block transfers of data from program or data memory to the register file. The address of the memory location is specified by a working register pair. The contents of the source location are loaded into the destination location. The memory address is then incremented automatically. The contents of the source are unaffected.

LDCI refers to program memory and LDEI refers to external data memory. The assembler makes 'Irr' even for program memory and odd for data memory.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | $\underline{c}$Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Examples: Given: R6 $=10 \mathrm{H}, \mathrm{R7}=33 \mathrm{H}, \mathrm{R} 8=12 \mathrm{H}$, program memory locations $1033 \mathrm{H}=0 \mathrm{CDH}$ and 1034 H $=0 \mathrm{C} 5 \mathrm{H}$; external data memory locations $1033 \mathrm{H}=0 \mathrm{DDH}$ and $1034 \mathrm{H}=0 \mathrm{D} 5 \mathrm{H}$ :

LDCI R8,@RR6 ; OCDH (contents of program memory location 1033H) is loaded
; into R8 and RR6 is incremented by one (RR6 $\leftarrow \mathrm{RR} 6+1$ )
; R8 = 0CDH, R6 = 10H, R7 = 34H

LDEI R8,@RR6 ; 0DDH (contents of data memory location 1033H) is loaded
; into R8 and RR6 is incremented by one (RR6 $\leftarrow \mathrm{RR} 6+1$ )
; R8 = 0DDH, R6 = 10H,R7 = 34H

## LDCPD/LDEPD — Load Memory with Pre-Decrement

LDCPD/

| LDEPD | $\mathrm{dst}, \mathrm{src}$ |
| :--- | :--- |
| Operation: | $\mathrm{rr} \leftarrow \mathrm{rr}-1$ |

dst $\leftarrow$ src
These instructions are used for block transfers of data from program or data memory from the register file. The address of the memory location is specified by a working register pair and is first decremented. The contents of the source location are then loaded into the destination location. The contents of the source are unaffected.

LDCPD refers to program memory and LDEPD refers to external data memory. The assembler makes 'Irr' an even number for program memory and an odd number for external data memory.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Examples: Given: R0 $=77 \mathrm{H}, \mathrm{R} 6=30 \mathrm{H}$, and $\mathrm{R} 7=00 \mathrm{H}$ :
LDCPD @RR6,R0 ; (RR6 $\leftarrow \mathrm{RR} 6-1)$
; 77H (contents of R0) is loaded into program memory location
; 2FFFFH (3000H - 1H)
; RO $=77 \mathrm{H}, \mathrm{R} 6=2 \mathrm{FH}, \mathrm{R} 7=0 F F H$
LDEPD @RR6,R0 ; (RR6 $\leftarrow \mathrm{RR} 6-1)$
; 77H (contents of R0) is loaded into external data memory
location 2FFFH (3000H - 1H)
; R0 $=77 \mathrm{H}, \mathrm{R} 6=2 \mathrm{FH}, \mathrm{R} 7=0 \mathrm{FFH}$

## LDCPI/LDEPI — Load Memory with Pre-Increment

## LDCPII

LDEPI dst,src

Operation: $\quad \mathrm{rr} \leftarrow \mathrm{rr}+1$
dst $\leftarrow$ src
These instructions are used for block transfers of data from program or data memory from the register file. The address of the memory location is specified by a working register pair and is first incremented. The contents of the source location are loaded into the destination location. The contents of the source are unaffected.

LDCPI refers to program memory and LDEPI refers to external data memory. The assembler makes 'Irr' an even number for program memory and an odd number for data memory.

Flags: No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Examples: Given: R0 $=7 \mathrm{FH}, \mathrm{R6}=21 \mathrm{H}$, and R7 $=0 \mathrm{FFH}$ :

```
LDCPI @RR6,R0 ; (RR6 \leftarrow RR6 + 1)
    ; 7FH (contents of R0) is loaded into program memory
    ; location 2200H (21FFH + 1H)
    ; R0 = 7FH,R6 = 22H,R7 = 00H
LDEPI @RR6,R0 ; (RR6 \leftarrow RR6 + 1)
    ; 7FH (contents of R0) is loaded into external data memory
    ; location 2200H (21FFH + 1H)
    ; R0 = 7FH,R6 = 22H,R7 = 00H
```

## LDW - Load Word

LDW dst,src

Operation: dst $\leftarrow$ src
The contents of the source (a word) are loaded into the destination. The contents of the source are unaffected.

Flags: $\quad$ No flags are affected.
Format:

Examples: Given: R4 $=06 \mathrm{H}, \mathrm{R} 5=1 \mathrm{CH}, \mathrm{R} 6=05 \mathrm{H}, \mathrm{R} 7=02 \mathrm{H}$, register $00 \mathrm{H}=1 \mathrm{AH}$, register $01 \mathrm{H}=02 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$, and register $03 \mathrm{H}=0 \mathrm{FH}$ :

| LDW | RR6,RR4 | $\rightarrow$ | $R 6=06 \mathrm{H}, \mathrm{R} 7=1 \mathrm{CH}, \mathrm{R} 4=06 \mathrm{H}, \mathrm{R} 5=1 \mathrm{CH}$ |
| :--- | :--- | :--- | :--- |
| LDW | $00 \mathrm{H}, 02 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=03 \mathrm{H}$, register $01 \mathrm{H}=0 \mathrm{FH}$, <br> register $02 \mathrm{H}=03 \mathrm{H}$, register $03 \mathrm{H}=0 \mathrm{FH}$ |
| LDW | RR2,@R7 | $\rightarrow$ | $\mathrm{R} 2=03 \mathrm{H}, \mathrm{R} 3=0 \mathrm{FH}$, |
| LDW | $04 \mathrm{H}, @ 01 \mathrm{H}$ | $\rightarrow$ | Register $04 \mathrm{H}=03 \mathrm{H}$, register $05 \mathrm{H}=0 \mathrm{FH}$ |
| LDW | RR6,\#1234H | $\rightarrow$ | $\mathrm{R} 6=12 \mathrm{H}, \mathrm{R} 7=34 \mathrm{H}$ |
| LDW | $02 H, \# 0 F E D H$ | $\rightarrow$ | Register $02 \mathrm{H}=0 \mathrm{FH}$, register $03 \mathrm{H}=0 \mathrm{HDH}$ |

In the second example, please note that the statement "LDW $00 \mathrm{H}, 02 \mathrm{H}$ " loads the contents of the source word $02 \mathrm{H}, 03 \mathrm{H}$ into the destination word $00 \mathrm{H}, 01 \mathrm{H}$. This leaves the value 03 H in general register 00 H and the value 0 FH in register 01 H .

The other examples show how to use the LDW instruction with various addressing modes and formats.

## MULT - Multiply (Unsigned)

MULT dst,src
Operation: dst $\leftarrow$ dst $\times$ src
The 8-bit destination operand (even register of the register pair) is multiplied by the source operand ( 8 bits) and the product (16 bits) is stored in the register pair specified by the destination address. Both operands are treated as unsigned integers.

Flags: $\quad$ C: Set if result is $>255$; cleared otherwise.
Z: Set if the result is "0"; cleared otherwise.
S: Set if MSB of the result is a "1"; cleared otherwise.
V: Cleared.
D: Unaffected.
H: Unaffected.

## Format:

Examples: $\quad$ Given: Register $00 \mathrm{H}=20 \mathrm{H}$, register $01 \mathrm{H}=03 \mathrm{H}$, register $02 \mathrm{H}=09 \mathrm{H}$, register $03 \mathrm{H}=06 \mathrm{H}$ :
MULT $00 \mathrm{H}, 02 \mathrm{H} \rightarrow$ Register $00 \mathrm{H}=01 \mathrm{H}$, register $01 \mathrm{H}=20 \mathrm{H}$, register $02 \mathrm{H}=09 \mathrm{H}$
MULT $00 \mathrm{H}, @ 01 \mathrm{H} \rightarrow$ Register $00 \mathrm{H}=00 \mathrm{H}$, register $01 \mathrm{H}=0 \mathrm{COH}$
MULT $00 \mathrm{H}, \# 30 \mathrm{H} \rightarrow \quad$ Register $00 \mathrm{H}=06 \mathrm{H}$, register $01 \mathrm{H}=00 \mathrm{H}$
In the first example, the statement "MULT $00 \mathrm{H}, 02 \mathrm{H}$ " multiplies the 8 -bit destination operand (in the register 00 H of the register pair $00 \mathrm{H}, 01 \mathrm{H}$ ) by the source register 02 H operand $(09 \mathrm{H})$. The 16 -bit product, 0120 H , is stored in the register pair $00 \mathrm{H}, 01 \mathrm{H}$.

NEXT - Next
NEXT
Operation: $\mathrm{PC} \leftarrow$ @ IP
$\mathrm{IP} \leftarrow \mathrm{IP}+2$
The NEXT instruction is useful when implementing threaded-code languages. The program memory word that is pointed to by the instruction pointer is loaded into the program counter. The instruction pointer is then incremented by two.

Flags: No flags are affected.

## Format:

| $c \mid c c c$ | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 10 | OF |

Example: The following diagram shows one example of how to use the NEXT instruction.

## NOP - No Operation

## NOP

Operation: No action is performed when the CPU executes this instruction. Typically, one or more NOPs are executed in sequence in order to effect a timing delay of variable duration.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 4 | FF |

Example: When the instruction
NOP
is encountered in a program, no operation occurs. Instead, there is a delay in instruction execution time.

## OR - Logical OR

OR dst,src
Operation: dst $\leftarrow$ dst OR src
The source operand is logically ORed with the destination operand and the result is stored in the destination. The contents of the source are unaffected. The OR operation results in a "1" being stored whenever either of the corresponding bits in the two operands is a " 1 "; otherwise a " 0 " is stored.

Flags: $\quad \mathrm{C}:$ Unaffected.
Z: Set if the result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if the result bit 7 is set; cleared otherwise.
V: Always cleared to "0".
D: Unaffected.
H: Unaffected.

## Format:

|  |  |  | Bytes | Cycles | Opcode (Hex) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst \| sr |  | 2 | 4 | 42 | $r$ | r |
|  |  |  |  | 6 | 43 | $r$ | Ir |
| opc | src | dst | 3 | 6 | 44 | R | R |
|  |  |  |  | 6 | 45 | R | IR |
| opc | dst | SrC | 3 | 6 | 46 | R | IM |

Examples: $\quad$ Given: $\mathrm{RO}=15 \mathrm{H}, \mathrm{R} 1=2 \mathrm{AH}, \mathrm{R} 2=01 \mathrm{H}$, register $00 \mathrm{H}=08 \mathrm{H}$, register $01 \mathrm{H}=37 \mathrm{H}$, and register $08 \mathrm{H}=8 \mathrm{AH}$ :

| OR | $R 0, R 1$ | $\rightarrow$ | $R 0=3 F H, R 1=2 A H$ |
| :--- | :--- | :--- | :--- |
| OR | $R 0, @ R 2$ | $\rightarrow$ | $R 0=37 H, R 2=01 H$, register $01 \mathrm{H}=37 \mathrm{H}$ |
| OR | $00 \mathrm{H}, 01 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=3 \mathrm{FH}$, register $01 \mathrm{H}=37 \mathrm{H}$ |
| OR | $01 \mathrm{H}, @ 00 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=08 \mathrm{H}$, register $01 \mathrm{H}=0 \mathrm{BFH}$ |
| OR | $00 \mathrm{H}, \# 02 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=0 \mathrm{H}$ |

In the first example, if working register R0 contains the value 15 H and register R1 the value 2 AH , the statement "OR R0,R1" logical-ORs the R0 and R1 register contents and stores the result (3FH) in destination register R0.

The other examples show the use of the logical OR instruction with the various addressing modes and formats.

## POP — Pop From Stack

POP dst
Operation: dst $\leftarrow$ @SP
$\mathrm{SP} \leftarrow \mathrm{SP}+1$
The contents of the location addressed by the stack pointer are loaded into the destination. The stack pointer is then incremented by one.

Flags: No flags affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> opc dst | 2 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 50 | R |  |  |  |  |  |

Examples: Given: Register $00 \mathrm{H}=01 \mathrm{H}$, register $01 \mathrm{H}=1 \mathrm{BH}, \mathrm{SPH}(0 \mathrm{D} 8 \mathrm{H})=00 \mathrm{H}, \mathrm{SPL}(0 \mathrm{D} 9 \mathrm{H})=$ $0 F B H$, and stack register $0 F B H=55 H$ :

```
POP 00H R Register 00H = 55H,SP = 00FCH
POP @00H }->\mathrm{ Register 00H = 01H, register 01H = 55H,SP = 00FCH
```

In the first example, general register 00 H contains the value 01 H . The statement "POP 00 H " loads the contents of location $00 \mathrm{FBH}(55 \mathrm{H})$ into destination register 00 H and then increments the stack pointer by one. Register 00 H then contains the value 55 H and the SP points to location 00FCH.

## POPUD - Pop User Stack (Decrementing)

| POPUD | $\mathrm{dst}, \mathrm{src}$ |
| :--- | :--- |
| Operation: | $\mathrm{dst} \leftarrow \mathrm{src}$ |
|  | $\mathrm{IR} \leftarrow \mathrm{IR}-1$ |

This instruction is used for user-defined stacks in the register file. The contents of the register file location addressed by the user stack pointer are loaded into the destination. The user stack pointer is then decremented.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Example: Given: Register $00 \mathrm{H}=42 \mathrm{H}$ (user stack pointer register), register $42 \mathrm{H}=6 \mathrm{FH}$, and register $02 \mathrm{H}=70 \mathrm{H}$ :

POPUD 02H,@00H $\rightarrow$ Register $00 \mathrm{H}=41 \mathrm{H}$, register $02 \mathrm{H}=6 \mathrm{FH}$, register $42 \mathrm{H}=$ 6FH

If general register 00 H contains the value 42 H and register 42 H the value 6 FH , the statement "POPUD 02H,@00H" loads the contents of register 42H into the destination register 02H. The user stack pointer is then decremented by one, leaving the value 41 H .

## POPUI — Pop User Stack (Incrementing)

POPUI dst,src

Operation: dst $\leftarrow$ src
$\mathrm{IR} \leftarrow \mathrm{IR}+1$
The POPUI instruction is used for user-defined stacks in the register file. The contents of the register file location addressed by the user stack pointer are loaded into the destination. The user stack pointer is then incremented.

Flags: No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | src |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | src | dst | 3 | 8 | 93 | R | IR |

Example: Given: Register $00 \mathrm{H}=01 \mathrm{H}$ and register $01 \mathrm{H}=70 \mathrm{H}$ :
POPUI $02 \mathrm{H}, @ 00 \mathrm{H} \rightarrow$ Register $00 \mathrm{H}=02 \mathrm{H}$, register $01 \mathrm{H}=70 \mathrm{H}$, register $02 \mathrm{H}=70 \mathrm{H}$
If general register 00 H contains the value 01 H and register 01 H the value 70 H , the statement "POPUI 02H,@00H" loads the value 70 H into the destination general register 02 H . The user stack pointer (register 00 H ) is then incremented by one, changing its value from 01 H to 02 H .

## PUSH — Push To Stack

```
PUSH src
Operation: SP \leftarrow SP - 1
@SP \leftarrow src
```

A PUSH instruction decrements the stack pointer value and loads the contents of the source (src) into the location addressed by the decremented stack pointer. The operation then adds the new value to the top of the stack.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | src |  | 2 | 8 (internal clock) | 70 |

Examples: Given: Register $40 \mathrm{H}=4 \mathrm{FH}$, register 4FH $=0 \mathrm{AAH}, \mathrm{SPH}=00 \mathrm{H}$, and SPL $=00 \mathrm{H}$ :
PUSH 40H $\rightarrow \quad$ Register 40H $=4 \mathrm{FH}$, stack register 0FFH $=4 \mathrm{FH}$, $\mathrm{SPH}=0 \mathrm{FFH}, \mathrm{SPL}=0 \mathrm{FFH}$

PUSH @40H $\rightarrow$ Register 40H $=4 \mathrm{FH}$, register 4FH $=0 \mathrm{AAH}$, stack register OFFH $=0 \mathrm{AAH}, \mathrm{SPH}=0 F F H, S P L=0 F F H$

In the first example, if the stack pointer contains the value 0000 H , and general register 40 H the value 4 FH , the statement "PUSH 40 H " decrements the stack pointer from 0000 to $0 F F F F H$. It then loads the contents of register 40H into location OFFFFH and adds this new value to the top of the stack.

## PUSHUD — Push User Stack (Decrementing)

| PUSHUD | dst,src |
| :--- | :--- |
| Operation: | $\mathrm{IR} \leftarrow \mathrm{IR}-1$ |
|  | $\mathrm{dst} \leftarrow \mathrm{src}$ |

This instruction is used to address user-defined stacks in the register file. PUSHUD decrements the user stack pointer and loads the contents of the source into the register addressed by the decremented stack pointer.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Example: Given: Register $00 \mathrm{H}=03 \mathrm{H}$, register $01 \mathrm{H}=05 \mathrm{H}$, and register $02 \mathrm{H}=1 \mathrm{AH}$ :
PUSHUD @00H,01H $\rightarrow \quad$ Register $00 \mathrm{H}=02 \mathrm{H}$, register $01 \mathrm{H}=05 \mathrm{H}$, register $02 \mathrm{H}=05 \mathrm{H}$
If the user stack pointer (register 00 H , for example) contains the value 03 H , the statement "PUSHUD @ $00 \mathrm{H}, 01 \mathrm{H}$ " decrements the user stack pointer by one, leaving the value 02 H . The 01 H register value, 05 H , is then loaded into the register addressed by the decremented user stack pointer.

## PUSHUI — Push User Stack (Incrementing)

| PUSHUI | dst,src |
| :--- | :--- |
| Operation: | $\mathrm{IR} \leftarrow \mathrm{IR}+1$ |
|  | $\mathrm{dst} \leftarrow \mathrm{src}$ |

This instruction is used for user-defined stacks in the register file. PUSHUI increments the user stack pointer and then loads the contents of the source into the register location addressed by the incremented user stack pointer.

Flags: $\quad$ No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Example: Given: Register $00 \mathrm{H}=03 \mathrm{H}$, register $01 \mathrm{H}=05 \mathrm{H}$, and register $04 \mathrm{H}=2 \mathrm{AH}$ :
PUSHUI @ $00 \mathrm{H}, 01 \mathrm{H} \rightarrow$ Register $00 \mathrm{H}=04 \mathrm{H}$, register $01 \mathrm{H}=05 \mathrm{H}$, register $04 \mathrm{H}=05 \mathrm{H}$
If the user stack pointer (register 00 H , for example) contains the value 03 H , the statement "PUSHUI @00H,01H" increments the user stack pointer by one, leaving the value 04 H . The 01 H register value, 05 H , is then loaded into the location addressed by the incremented user stack pointer.

## RCF - Reset Carry Flag

| RCF | RCF |
| :--- | :--- |
| Operation: | $C \leftarrow 0$ |

The carry flag is cleared to logic zero, regardless of its previous value.
Flags: $\quad$ C: Cleared to " 0 ".
No other flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 4 | CF |

Example: Given: $C=" 1$ " or "0":
The instruction RCF clears the carry flag (C) to logic zero.

## RET - Return

RET
Operation: $\quad \mathrm{PC} \leftarrow @ \mathrm{SP}$
$\mathrm{SP} \leftarrow \mathrm{SP}+2$
The RET instruction is normally used to return to the previously executing procedure at the end of a procedure entered by a CALL instruction. The contents of the location addressed by the stack pointer are popped into the program counter. The next statement that is executed is the one that is addressed by the new program counter value.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 8 (internal stack) | AF |
|  |  | 10 (internal stack) |  |

Example: Given: $\mathrm{SP}=00 \mathrm{FCH},(\mathrm{SP})=101 \mathrm{AH}$, and $\mathrm{PC}=1234$ :
RET $\rightarrow \quad \mathrm{PC}=101 \mathrm{AH}, \mathrm{SP}=00 \mathrm{FEH}$
The statement "RET" pops the contents of stack pointer location 00FCH $(10 \mathrm{H})$ into the high byte of the program counter. The stack pointer then pops the value in location 00FEH (1AH) into the PC's low byte and the instruction at location 101AH is executed. The stack pointer now points to memory location 00FEH.

## RL — Rotate Left

RL dst
Operation: $\quad \mathrm{C} \leftarrow \mathrm{dst}(7)$
dst (0) $\leftarrow$ dst (7)
dst $(\mathrm{n}+1) \leftarrow$ dst (n), $\mathrm{n}=0-6$
The contents of the destination operand are rotated left one bit position. The initial value of bit 7 is moved to the bit zero (LSB) position and also replaces the carry flag.

Flags: $\quad$ C: Set if the bit rotated from the most significant bit position (bit 7 ) was "1".
Z: Set if the result is " 0 "; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Set if arithmetic overflow occurred; cleared otherwise.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | 90 | R |

Examples: Given: Register $00 \mathrm{H}=0 \mathrm{AAH}$, register $01 \mathrm{H}=02 \mathrm{H}$ and register $02 \mathrm{H}=17 \mathrm{H}$ :

| RL | 00 H | $\rightarrow$ | Register $00 \mathrm{H}=55 \mathrm{H}, \mathrm{C}=" 1 "$ |
| :--- | :--- | :--- | :--- |
| RL | $@ 01 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=02 \mathrm{H}$, register $02 \mathrm{H}=2 \mathrm{EH}, \mathrm{C}=" 0 "$ |

In the first example, if general register 00H contains the value 0AAH (10101010B), the statement "RL 00 H " rotates the 0AAH value left one bit position, leaving the new value 55H (01010101B) and setting the carry and overflow flags.

## RLC — Rotate Left Through Carry

```
RLC dst
Operation: dst (0) \leftarrow C
    C}\leftarrowdst (7
    dst (n + 1) \leftarrow dst (n), n = 0-6
```

The contents of the destination operand with the carry flag are rotated left one bit position. The initial value of bit 7 replaces the carry flag (C); the initial value of the carry flag replaces bit zero.

Flags: C: Set if the bit rotated from the most significant bit position (bit 7) was "1".
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
$\mathbf{V}$ : Set if arithmetic overflow occurred, that is, if the sign of the destination changed during rotation; cleared otherwise.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> opc dst | 2 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Examples: Given: Register $00 \mathrm{H}=0 \mathrm{AAH}$, register $01 \mathrm{H}=02 \mathrm{H}$, and register $02 \mathrm{H}=17 \mathrm{H}, \mathrm{C}=$ " 0 ":

| RLC | 00 H | $\rightarrow$ | Register $00 \mathrm{H}=54 \mathrm{H}, \mathrm{C}=" 1 "$ |
| :--- | :--- | :--- | :--- |
| RLC | $@ 01 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=02 \mathrm{H}$, register $02 \mathrm{H}=2 \mathrm{EH}, \mathrm{C}=" 0 "$ |

In the first example, if general register 00H has the value OAAH (10101010B), the statement "RLC $00 H$ " rotates OAAH one bit position to the left. The initial value of bit 7 sets the carry flag and the initial value of the C flag replaces bit zero of register 00 H , leaving the value 55 H (01010101B). The MSB of register 00 H resets the carry flag to " 1 " and sets the overflow flag.

## RR — Rotate Right

RR dst
Operation: $\quad \mathrm{C} \leftarrow \mathrm{dst}(0)$
dst (7) $\leftarrow$ dst (0)
dst $(\mathrm{n}) \leftarrow$ dst $(\mathrm{n}+1), \mathrm{n}=0-6$
The contents of the destination operand are rotated right one bit position. The initial value of bit zero (LSB) is moved to bit 7 (MSB) and also replaces the carry flag (C).

Flags: $\quad \mathbf{C}:$ Set if the bit rotated from the least significant bit position (bit zero) was "1".
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Set if arithmetic overflow occurred, that is, if the sign of the destination changed during rotation; cleared otherwise.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | $E 0$ | $R$ |

Examples: Given: Register $00 \mathrm{H}=31 \mathrm{H}$, register $01 \mathrm{H}=02 \mathrm{H}$, and register $02 \mathrm{H}=17 \mathrm{H}$ :

| RR | 00 H | $\rightarrow$ | Register $00 \mathrm{H}=98 \mathrm{H}, \mathrm{C}=" 1 "$ |
| :--- | :--- | :--- | :--- |
| RR | $@ 01 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=02 \mathrm{H}$, register $02 \mathrm{H}=8 \mathrm{BH}, \mathrm{C}=" 1 "$ |

In the first example, if general register 00 H contains the value $31 \mathrm{H}(00110001 \mathrm{~B})$, the statement " RR 00 H " rotates this value one bit position to the right. The initial value of bit zero is moved to bit 7 , leaving the new value $98 \mathrm{H}(10011000 \mathrm{~B})$ in the destination register. The initial bit zero also resets the C flag to " 1 " and the sign flag and overflow flag are also set to "1".

## RRC - Rotate Right Through Carry

```
RRC dst
Operation: dst (7) \leftarrow C
    C}\leftarrowd\mathrm{ dst (0)
    dst (n) \leftarrow dst (n + 1), n = 0-6
```

The contents of the destination operand and the carry flag are rotated right one bit position. The initial value of bit zero (LSB) replaces the carry flag; the initial value of the carry flag replaces bit 7 (MSB).

Flags: $\quad \mathbf{C}$ : Set if the bit rotated from the least significant bit position (bit zero) was "1".
Z: Set if the result is "0" cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Set if arithmetic overflow occurred, that is, if the sign of the destination changed during rotation; cleared otherwise.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | CO | R |

| Examples: | Given | Register |  | register 01H |
| :---: | :---: | :---: | :---: | :---: |
|  | RRC | 00H | $\rightarrow$ | Register 00H |
|  | RRC | @01H | $\rightarrow$ | Register 01H |

In the first example, if general register 00H contains the value 55H (01010101B), the statement "RRC 00 H " rotates this value one bit position to the right. The initial value of bit zero ("1") replaces the carry flag and the initial value of the C flag ("1") replaces bit 7. This leaves the new value $2 \mathrm{AH}(00101010 \mathrm{~B})$ in destination register 00 H . The sign flag and overflow flag are both cleared to " 0 ".

## SBO - Select Bank 0

## SB0

Operation: $\quad$ BANK $\leftarrow 0$
The SB0 instruction clears the bank address flag in the FLAGS register (FLAGS.0) to logic zero, selecting bank 0 register addressing in the set 1 area of the register file.

Flags: No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: | :---: |
| opc | 1 | 4 | 4 F |

Example: The statement
SB0
clears FLAGS. 0 to " 0 ", selecting bank 0 register addressing.

## SB1 - Select Bank 1

SB1
Operation: BANK $\leftarrow 1$
The SB1 instruction sets the bank address flag in the FLAGS register (FLAGS.0) to logic one, selecting bank 1 register addressing in the set 1 area of the register file. (Bank 1 is not implemented in some S3C8-series microcontrollers.)

Flags: $\quad$ No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 4 | 5 F |

Example: The statement
SB1
sets FLAGS. 0 to " 1 ", selecting bank 1 register addressing, if implemented.

## SBC - Subtract with Carry

## SBC dst,src

Operation: dst $\leftarrow$ dst - src - c
The source operand, along with the current value of the carry flag, is subtracted from the destination operand and the result is stored in the destination. The contents of the source are unaffected. Subtraction is performed by adding the two's-complement of the source operand to the destination operand. In multiple precision arithmetic, this instruction permits the carry ("borrow") from the subtraction of the low-order operands to be subtracted from the subtraction of high-order operands.

Flags: C: Set if a borrow occurred (src > dst); cleared otherwise.
Z: Set if the result is " 0 "; cleared otherwise.
$\mathbf{S}$ : Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred, that is, if the operands were of opposite sign and the sign of the result is the same as the sign of the source; cleared otherwise.
D: Always set to "1".
H: Cleared if there is a carry from the most significant bit of the low-order four bits of the result; set otherwise, indicating a "borrow".

## Format:

Examples: Given: R1 $=10 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}, \mathrm{C}=" 1$, register $01 \mathrm{H}=20 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$, and register $03 \mathrm{H}=0 \mathrm{AH}$ :

$$
\begin{array}{llll}
\text { SBC } & \text { R1,R2 } & \rightarrow & R 1=0 C H, R 2=03 H \\
\text { SBC } & R 1, @ R 2 & \rightarrow & R 1=05 H, R 2=03 H, \text { register } 03 H=0 A H \\
\text { SBC } & 01 H, 02 H & \rightarrow & \text { Register } 01 H=1 C H, \text { register } 02 H=03 H \\
\text { SBC } & 01 H, @ 02 H & \rightarrow & \text { Register } 01 H=15 H, \text { register } 02 H=03 H, \text { register } 03 H=0 A H \\
\text { SBC } & 01 H, \# 8 A H & \rightarrow & \text { Register } 01 H=5 H ; C, S, \text { and } V=" 1 "
\end{array}
$$

In the first example, if working register R1 contains the value 10 H and register R2 the value 03 H , the statement "SBC R1,R2" subtracts the source value ( 03 H ) and the C flag value ("1") from the destination $(10 \mathrm{H})$ and then stores the result $(0 \mathrm{CH})$ in register R1.

## SCF - Set Carry Flag

SCF
Operation: $\quad C \leftarrow 1$
The carry flag (C) is set to logic one, regardless of its previous value.
Flags: $\quad$ C: Set to "1".
No other flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: |
| opc | 1 | 4 | DF |

Example: The statement
SCF
sets the carry flag to logic one.

## SRA - Shift Right Arithmetic

SRA dst
Operation: $\quad$ dst (7) $\leftarrow$ dst (7)
$\mathrm{C} \leftarrow$ dst (0)
dst $(\mathrm{n}) \leftarrow$ dst $(\mathrm{n}+1), \mathrm{n}=0-6$
An arithmetic shift-right of one bit position is performed on the destination operand. Bit zero (the LSB) replaces the carry flag. The value of bit 7 (the sign bit) is unchanged and is shifted into bit position 6.

Flags: $\quad \mathbf{C}:$ Set if the bit shifted from the LSB position (bit zero) was "1".
Z: Set if the result is " 0 "; cleared otherwise.
S: Set if the result is negative; cleared otherwise.
V: Always cleared to "0".
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | DO | R |

Examples: Given: Register $00 \mathrm{H}=9 \mathrm{AH}$, register $02 \mathrm{H}=03 \mathrm{H}$, register $03 \mathrm{H}=0 \mathrm{BCH}$, and $\mathrm{C}=$ " 1 ":
SRA $00 \mathrm{H} \rightarrow$ Register $00 \mathrm{H}=0 \mathrm{CD}, \mathrm{C}=" 0 "$
SRA @02H $\rightarrow$ Register 02H $=03 \mathrm{H}$, register $03 \mathrm{H}=0 \mathrm{HEH}, \mathrm{C}={ }^{\circ} 0$
In the first example, if general register 00 H contains the value 9AH (10011010B), the statement "SRA 00 H " shifts the bit values in register 00 H right one bit position. Bit zero ("O") clears the C flag and bit 7 ("1") is then shifted into the bit 6 position (bit 7 remains unchanged). This leaves the value 0CDH (11001101B) in destination register 00H.

## SRP/SRP0/SRP1 - Set Register Pointer

| SRP | SrC |
| :--- | :--- |
| SRP0 | src |
| SRP1 | src |

Operation:
If $\operatorname{src}(1)=1$ and $\operatorname{src}(0)=0$ then:
If src (1) $=0$ and $\operatorname{src}(0)=1$ the
If $\operatorname{src}(1)=0$ and $\operatorname{src}(0)=0$ then:

| RP0 (3-7) | $\leftarrow$ | $\operatorname{src}(3-7)$ |
| :--- | :--- | :--- |
| $\operatorname{RP1}(3-7)$ | $\leftarrow$ | $\operatorname{src}(3-7)$ |
| $\operatorname{RP0}(4-7)$ | $\leftarrow$ | $\operatorname{src}(4-7)$, |

RP0 (3)
$\leftarrow 0$
RP1 (4-7) $\leftarrow \quad \operatorname{src}(4-7)$,
RP1 (3)
$\leftarrow \quad 1$
The source data bits one and zero (LSB) determine whether to write one or both of the register pointers, RP0 and RP1. Bits 3-7 of the selected register pointer are written unless both register pointers are selected. RP0.3 is then cleared to logic zero and RP1.3 is set to logic one.

Flags: No flags are affected.

## Format:

|  |  |  |  |  |  |  |  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> src |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | src | 2 | 4 | 31 | IM |  |  |  |  |  |  |

Examples: The statement
SRP \#40H
sets register pointer 0 (RP0) at location 0D6H to 40H and register pointer 1 (RP1) at location 0D7H to 48 H .

The statement "SRP0 \#50H" sets RP0 to 50 H , and the statement "SRP1 \#68H" sets RP1 to 68 H .

## STOP - Stop Operation

STOP
Operation:
The STOP instruction stops the both the CPU clock and system clock and causes the microcontroller to enter Stop mode. During Stop mode, the contents of on-chip CPU registers, peripheral registers, and I/O port control and data registers are retained. Stop mode can be released by an external reset operation or by external interrupts. For the reset operation, the RESET pin must be held to Low level until the required oscillation stabilization interval has elapsed.

Flags: $\quad$ No flags are affected.
Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst | $\underline{\text { src }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |

$\begin{array}{ll}\text { Example: } & \text { The statement } \\ & \text { STOP } \\ & \text { halts all microcontroller operations. }\end{array}$

## SUB - Subtract

SUB dst,src
Operation: dst $\leftarrow$ dst - src
The source operand is subtracted from the destination operand and the result is stored in the destination. The contents of the source are unaffected. Subtraction is performed by adding the two's complement of the source operand to the destination operand.

Flags: $\quad$ C: Set if a "borrow" occurred; cleared otherwise.
Z: Set if the result is "0"; cleared otherwise.
$\mathbf{S}$ : Set if the result is negative; cleared otherwise.
V: Set if arithmetic overflow occurred, that is, if the operands were of opposite signs and the sign of the result is of the same as the sign of the source operand; cleared otherwise.
D: Always set to "1".
H: Cleared if there is a carry from the most significant bit of the low-order four bits of the result; set otherwise indicating a "borrow".

Format:

|  |  |  | Bytes | Cycles | Opcode (Hex) | Addr Mode dst src |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst \| src |  | 2 | 4 | 22 | $r$ | $r$ |
|  |  |  |  | 6 | 23 | $r$ | Ir |
| opc | SrC | dst | 3 | 6 | 24 | R | R |
|  |  |  |  | 6 | 25 | R | IR |
| opc | dst | SrC | 3 | 6 | 26 | R | IM |

Examples: Given: R1 $=12 \mathrm{H}, \mathrm{R} 2=03 \mathrm{H}$, register $01 \mathrm{H}=21 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$, register $03 \mathrm{H}=0 \mathrm{AH}$ :

| SUB | R1,R2 | $\rightarrow$ | $R 1=0 F H, R 2=03 H$ |
| :--- | :--- | :--- | :--- |
| SUB | $R 1, @ R 2$ | $\rightarrow$ | $R 1=08 H, R 2=03 H$ |
| SUB | $01 \mathrm{H}, 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=1 \mathrm{EH}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| SUB | $01 \mathrm{H}, @ 02 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=17 \mathrm{H}$, register $02 \mathrm{H}=03 \mathrm{H}$ |
| SUB | $01 \mathrm{H}, \# 90 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=91 \mathrm{H} ; \mathrm{C}, \mathrm{S}$, and $\mathrm{V}=" 1 "$ |
| SUB | $01 \mathrm{H}, \# 65 \mathrm{H}$ | $\rightarrow$ | Register $01 \mathrm{H}=0 \mathrm{BCH} ; \mathrm{C}$ and $\mathrm{S}=" 1 ", \mathrm{~V}=" 0 "$ |

In the first example, if working register R1 contains the value 12H and if register R2 contains the value 03 H , the statement "SUB R1,R2" subtracts the source value $(03 \mathrm{H})$ from the destination value $(12 \mathrm{H})$ and stores the result (0FH) in destination register R1.

## SWAP - Swap Nibbles

SWAP dst
Operation: dst (0-3) $\leftrightarrow$ dst (4-7)
The contents of the lower four bits and upper four bits of the destination operand are swapped.

Flags: C: Undefined.
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Undefined.
D: Unaffected.
H: Unaffected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) | Addr Mode <br> dst |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst | 2 | 4 | $F 0$ | R |

Examples: Given: Register $00 \mathrm{H}=3 \mathrm{EH}$, register $02 \mathrm{H}=03 \mathrm{H}$, and register $03 \mathrm{H}=0 \mathrm{~A} 4 \mathrm{H}$ :

| SWAP 00 H | $\rightarrow$ | Register $00 \mathrm{H}=0 \mathrm{E} 3 \mathrm{H}$ |
| :--- | :--- | :--- | :--- |
| SWAP @02H | $\rightarrow$ | Register $02 \mathrm{H}=03 \mathrm{H}$, register $03 \mathrm{H}=4 \mathrm{AH}$ |

In the first example, if general register 00H contains the value 3EH (00111110B), the statement "SWAP 00 H " swaps the lower and upper four bits (nibbles) in the 00 H register, leaving the value 0E3H (11100011B).

## TCM - Test Complement Under Mask

TCM dst,src
Operation: (NOT dst) AND src
This instruction tests selected bits in the destination operand for a logic one value. The bits to be tested are specified by setting a "1" bit in the corresponding position of the source operand (mask). The TCM statement complements the destination operand, which is then ANDed with the source mask. The zero ( $Z$ ) flag can then be checked to determine the result. The destination and source operands are unaffected.

Flags: C: Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Always cleared to "0".
D: Unaffected.
H: Unaffected.
Format:

|  |  |  | Bytes | Cycles | Opcode (Hex) | Addr Mode |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst \| src |  | 2 | 4 | 62 | $r$ | r |
|  |  |  |  | 6 | 63 | $r$ | Ir |
| opc | src | dst | 3 | 6 | 64 | R | R |
|  |  |  |  | 6 | 65 | R | IR |
| opc | dst | SrC | 3 | 6 | 66 | R | IM |

Examples: Given: R0 $=0 \mathrm{C} 7 \mathrm{H}, \mathrm{R} 1=02 \mathrm{H}, \mathrm{R} 2=12 \mathrm{H}$, register $00 \mathrm{H}=2 \mathrm{BH}$, register $01 \mathrm{H}=$ 02 H , and register $02 \mathrm{H}=23 \mathrm{H}$ :

| TCM | R0,R1 | $\rightarrow$ | $\mathrm{RO}=0 \mathrm{C} 7 \mathrm{H}, \mathrm{R} 1=02 \mathrm{H}, \mathrm{Z}=$ "1" |
| :---: | :---: | :---: | :---: |
| TCM | R0,@R1 | $\rightarrow$ | $\mathrm{R0}=0 \mathrm{C} 7 \mathrm{H}, \mathrm{R} 1=02 \mathrm{H}$, register $02 \mathrm{H}=23 \mathrm{H}, \mathrm{Z}={ }^{\text {a }} 0$ |
| TCM | 00H,01H | $\rightarrow$ | Register $00 \mathrm{H}=2 \mathrm{BH}$, register $01 \mathrm{H}=02 \mathrm{H}, \mathrm{Z}=$ "1" |
| TCM | 00H,@01H | $\rightarrow$ | $\begin{aligned} & \text { Register } 00 \mathrm{H}=2 \mathrm{BH}, \text { register } 01 \mathrm{H}=02 \mathrm{H}, \\ & \text { register } 02 \mathrm{H}=23 \mathrm{H}, \mathrm{Z}=" 1 " \end{aligned}$ |
| TCM | 00H,\#34 | $\rightarrow$ | Register $00 \mathrm{H}=2 \mathrm{BH}, \mathrm{Z}={ }^{0} 0$ |

In the first example, if working register R0 contains the value 0C7H (11000111B) and register R1 the value $02 \mathrm{H}(00000010 \mathrm{~B})$, the statement "TCM R0,R1" tests bit one in the destination register for a " 1 " value. Because the mask value corresponds to the test bit, the $Z$ flag is set to logic one and can be tested to determine the result of the TCM operation.

## TM — Test Under Mask

## TM dst,src

Operation: dst AND src
This instruction tests selected bits in the destination operand for a logic zero value. The bits to be tested are specified by setting a "1" bit in the corresponding position of the source operand (mask), which is ANDed with the destination operand. The zero ( $Z$ ) flag can then be checked to determine the result. The destination and source operands are unaffected.

Flags: $\quad \mathbf{C}$ : Unaffected.
Z: Set if the result is "0"; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Always reset to "0".
D: Unaffected.
H: Unaffected.

## Format:

|  |  |  | Bytes | Cycles | Opcode (Hex) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| opc | dst \\| sic |  | 2 | 4 | 72 | $r$ | $r$ |
|  |  |  |  | 6 | 73 | $r$ | Ir |
| opc | src | dst | 3 | 6 | 74 | R | R |
|  |  |  |  | 6 | 75 | R | IR |
| opc | dst | SrC | 3 | 6 | 76 | R | IM |

Examples: Given: R0 $=0 \mathrm{C} 7 \mathrm{H}, \mathrm{R} 1=02 \mathrm{H}, \mathrm{R} 2=18 \mathrm{H}$, register $00 \mathrm{H}=2 \mathrm{BH}$, register $01 \mathrm{H}=$ 02 H , and register $02 \mathrm{H}=23 \mathrm{H}$ :

| TM | $R 0, R 1$ | $\rightarrow$ | $R 0=0 C 7 H, R 1=02 H, Z=" 0 "$ |
| :--- | :--- | :--- | :--- |
| TM | $R 0, @ R 1$ | $\rightarrow$ | $R 0=0 C 7 H, R 1=02 H$, register $02 \mathrm{H}=23 \mathrm{H}, \mathrm{Z}=" 0 "$ |
| TM | $00 \mathrm{H}, 01 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=2 \mathrm{BH}$, register $01 \mathrm{H}=02 \mathrm{H}, \mathrm{Z}=" 0 "$ |
| TM | $00 \mathrm{H}, @ 01 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=2 \mathrm{BH}$, register $01 \mathrm{H}=02 \mathrm{H}$, <br> register $02 \mathrm{H}=23 \mathrm{H}, \mathrm{Z}=" 0 "$ |
| TM | $00 \mathrm{H}, \# 54 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=2 \mathrm{BH}, \mathrm{Z}=" 1 "$ |

In the first example, if working register R0 contains the value 0C7H (11000111B) and register R1 the value $02 \mathrm{H}(00000010 \mathrm{~B})$, the statement "TM R0,R1" tests bit one in the destination register for a " 0 " value. Because the mask value does not match the test bit, the $Z$ flag is cleared to logic zero and can be tested to determine the result of the TM operation.

## WFI - Wait for Interrupt

WFI
Operation:
The CPU is effectively halted until an interrupt occurs, except that DMA transfers can still take place during this wait state. The WFI status can be released by an internal interrupt, including a fast interrupt .

Flags: No flags are affected.

## Format:

|  | Bytes | Cycles | Opcode <br> (Hex) |
| :---: | :---: | :---: | :---: | :---: |
| opc | 1 | $4 n$ | $3 F$ |

Example: The following sample program structure shows the sequence of operations that follow a "WFI" statement:

## XOR - Logical Exclusive OR

## XOR dst,src

Operation: dst $\leftarrow$ dst XOR src
The source operand is logically exclusive-ORed with the destination operand and the result is stored in the destination. The exclusive-OR operation results in a " 1 " bit being stored whenever the corresponding bits in the operands are different; otherwise, a " 0 " bit is stored.

Flags: C: Unaffected.
Z: Set if the result is " 0 "; cleared otherwise.
S: Set if the result bit 7 is set; cleared otherwise.
V: Always reset to "0".
D: Unaffected.
H: Unaffected.

## Format:

Examples: Given: R0 $=0 \mathrm{C} 7 \mathrm{H}, \mathrm{R} 1=02 \mathrm{H}, \mathrm{R} 2=18 \mathrm{H}$, register $00 \mathrm{H}=2 \mathrm{BH}$, register $01 \mathrm{H}=$ 02 H , and register $02 \mathrm{H}=23 \mathrm{H}$ :

| XOR | $R 0, R 1$ | $\rightarrow$ | $R 0=0 C 5 H, R 1=02 H$ |
| :--- | :--- | :--- | :--- |
| XOR | $R 0, @ R 1$ | $\rightarrow$ | $R 0=0 E 4 H, R 1=02 H$, register $02 \mathrm{H}=23 \mathrm{H}$ |
| XOR | $00 \mathrm{H}, 01 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=29 \mathrm{H}$, register $01 \mathrm{H}=02 \mathrm{H}$ |
| XOR | $00 \mathrm{H}, @ 01 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=08 \mathrm{H}$, register $01 \mathrm{H}=02 \mathrm{H}$, register $02 \mathrm{H}=$ |
| 23 H |  |  |  |
| XOR | $00 \mathrm{H}, \# 54 \mathrm{H}$ | $\rightarrow$ | Register $00 \mathrm{H}=7 \mathrm{FH}$ |

In the first example, if working register R0 contains the value 0 C 7 H and if register R1 contains the value 02 H , the statement "XOR R0,R1" logically exclusive-ORs the R1 value with the R0 value and stores the result $(0 \mathrm{C} 5 \mathrm{H})$ in the destination register R 0 .

## CLOCK CIRCUIT

## OVERVIEW

The clock frequency generated for the S3C828B/F828B/C8289/F8289/C8285/F8285 by an external crystal can range from 0.4 MHz to 11.1 MHz . The maximum CPU clock frequency is 11.1 MHz . The $X_{\text {IN }}$ and $X_{\text {OUT }}$ pins connect the external oscillator or clock source to the on-chip clock circuit.

## SYSTEM CLOCK CIRCUIT

The system clock circuit has the following components:

- External crystal or ceramic resonator oscillation source (or an external clock source)
- Oscillator stop and wake-up functions
- Programmable frequency divider for the CPU clock (fxx divided by 1, 2, 8, or 16)
- System clock control register, CLKCON
- Oscillator control register, OSCCON and STOP control register, STPCON

## CPU CLOCK NOTATION

In this document, the following notation is used for descriptions of the CPU clock;
fx: main clock
fxt: sub clock
fxx: selected system clock

## MAIN OSCILLATOR CIRCUITS

Figure 7-1. Crystal/Ceramic Oscillator (fx)

Figure 7-2. External Oscillator (fx)

Figure 7-3. RC Oscillator (fx)

## SUB OSCILLATOR CIRCUITS

Figure 7-4. Crystal Oscillator (fxt)

Figure 7-5. External Oscillator (fxt)

## CLOCK STATUS DURING POWER-DOWN MODES

The two power-down modes, Stop mode and Idle mode, affect the system clock as follows:

- In Stop mode, the main oscillator is halted. Stop mode is released, and the oscillator is started, by a reset operation or an external interrupt (with RC delay noise filter), and can be released by internal interrupt too when the sub-system oscillator is running and watch timer is operating with sub-system clock.
- In Idle mode, the internal clock signal is gated to the CPU, but not to interrupt structure, timers and timer/ counters. Idle mode is released by a reset or by an external or internal interrupt.

Figure 7-6. System Clock Circuit Diagram

## SMMSUNG

## SYSTEM CLOCK CONTROL REGISTER (CLKCON)

The system clock control register, CLKCON, is located in the set 1 , address D4H. It is read/write addressable and has the following functions:

- Oscillator frequency divide-by value

After the main oscillator is activated, and the $\mathrm{fxx} / 16$ (the slowest clock speed) is selected as the CPU clock. If necessary, you can then increase the CPU clock speed fxx/8, fxx/2, or fxx/1.

Figure 7-7. System Clock Control Register (CLKCON)

Figure 7-8. Oscillator Control Register (OSCCON)

Figure 7-9. STOP Control Register (STPCON)

## SWITCHING THE CPU CLOCK

Data loading in the oscillator control register, OSCCON, determine whether a main or a sub clock is selected as the CPU clock, and also how this frequency is to be divided by setting CLKCON. This makes it possible to switch dynamically between main and sub clocks and to modify operating frequencies.

OSCCON. 0 select the main clock ( fx ) or the sub clock ( fxt ) for the CPU clock. OSCCON .3 start or stop main clock oscillation, and OSCCON. 2 start or stop sub clock oscillation. CLKCON.4-. 3 control the frequency divider circuit, and divide the selected fxx clock by 1, 2, 8, 16.

For example, you are using the default CPU clock (normal operating mode and a main clock of fx/16) and you want to switch from the fx clock to a sub clock and to stop the main clock. To do this, you need to set CLKCON.4.3 to "11", OSCCON. 0 to " 1 ", and OSCCON. 3 to " 1 " simultaneously. This switches the clock from fx to fxt and stops main clock oscillation.

The following steps must be taken to switch from a sub clock to the main clock: first, set OSCCON. 3 to " 0 " to enable main clock oscillation. Then, after a certain number of machine cycles has elapsed, select the main clock by setting OSCCON. 0 to " 0 ".

## PROGRAMMING TIP - Switching the CPU clock

1. This example shows how to change from the main clock to the sub clock:
MA2SUB LD OSCCON, \#01H

RET
2. This example shows how to change from sub clock to main clock:

| SUB2MA | AND | OSCCON,\#07H | Start the main clock oscillation |
| :---: | :---: | :---: | :---: |
|  | CALL | DLY16 | Delay 16 ms |
|  | AND | OSCCON,\#06H | Switch to the main clock |
|  | RET |  |  |
| DLY16 | SRP | \# 0 COH |  |
|  | LD | R0,\#20H |  |
| DEL | NOP |  |  |
|  | DJNZ | R0,DEL |  |
|  | RET |  |  |

## RESET and POWER-DOWN

## SYSTEM RESET

## OVERVIEW

During a power-on reset, the voltage at $\mathrm{V}_{\mathrm{DD}}$ goes to High level and the RESET pin is forced to Low level. The RESET signal is input through a schmitt trigger circuit where it is then synchronized with the CPU clock. This procedure brings the S3C828B/F828B/C8289/F8289/C8285/F8285 into a known operating status.

To allow time for internal CPU clock oscillation to stabilize, the RESET pin must be held to Low level for a minimum time interval after the power supply comes within tolerance. The minimum required time of a reset operation for oscillation stabilization is 1 millisecond.

Whenever a reset occurs during normal operation (that is, when both $\mathrm{V}_{\mathrm{DD}}$ and RESET are High level), the nRESET pin is forced Low level and the reset operation starts. All system and peripheral control registers are then reset to their default hardware values

In summary, the following sequence of events occurs during a reset operation:

- All interrupt is disabled.
- The watchdog function (basic timer) is enabled.
- Ports 0-8 and set to input mode, and all pull-up resistors are disabled for the I/O port.
- Peripheral control and data register settings are disabled and reset to their default hardware values.
- The program counter (PC) is loaded with the program reset address in the ROM, 0100H.
- When the programmed oscillation stabilization time interval has elapsed, the instruction stored in ROM location 0100 H (and 0101 H ) is fetched and executed at normal mode by smart option.
- The reset address at ROM can be changed by Smart Option in the S3F828B (full-flash device). Refer to "The Chapter 19. Embedded Flash Memory Interface" for more detailed contents.

## NORMAL MODE RESET OPERATION

In normal (masked ROM) mode, the Test pin is tied to $\mathrm{V}_{\mathrm{SS}}$. A reset enables access to the S3C828B (64Kbyte), S3C8289 (32-Kbyte), and S3C8285 (16-Kbyte) on-chip ROM. (The external interface is not automatically configured).

NOTE
To program the duration of the oscillation stabilization interval, you make the appropriate settings to the basic timer control register, BTCON, before entering Stop mode. Also, if you do not want to use the basic timer watchdog function (which causes a system reset if a basic timer counter overflow occurs), you can disable it by writing "1010B" to the upper nibble of BTCON.

## HARDWARE RESET VALUES

Table 8-1, 8-2, 8-3 list the reset values for CPU and system registers, peripheral control registers, and peripheral data registers following a reset operation. The following notation is used to represent reset values:
— A "1" or a "0" shows the reset bit value as logic one or logic zero, respectively.

- An "x" means that the bit value is undefined after a reset.
- A dash ("-") means that the bit is either not used or not mapped, but read 0 is the bit value.

Table 8-1. S3C828B/F828B/C8289/F8289/C8285/F8285 Set 1 Register and Values After RESET

| Register Name | Mnemonic | Address |  | Bit Values After RESET |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Dec | Hex | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Locations D0H-D2H are not mapped. |  |  |  |  |  |  |  |  |  |  |  |
| Basic timer control register | BTCON | 211 | D3H | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| System clock control register | CLKCON | 212 | D4H | 0 | - | - | 0 | 0 | - | - | - |
| System flags register | FLAGS | 213 | D5H | X | X | X | X | X | X | 0 | 0 |
| Register pointer 0 | RP0 | 214 | D6H | 1 | 1 | 0 | 0 | 0 | - | - | - |
| Register pointer 1 | RP1 | 215 | D7H | 1 | 1 | 0 | 0 | 1 | - | - | - |
| Stack pointer (high byte) | SPH | 216 | D8H | X | x | x | X | X | X | x | X |
| Stack pointer (low byte) | SPL | 217 | D9H | X | X | X | X | X | X | x | X |
| Instruction pointer (high byte) | IPH | 218 | DAH | X | X | X | X | X | X | X | X |
| Instruction pointer (low byte) | IPL | 219 | DBH | X | X | X | X | X | X | X | X |
| Interrupt request register | IRQ | 220 | DCH | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Interrupt mask register | IMR | 221 | DDH | X | X | X | X | X | X | X | X |
| System mode register | SYM | 222 | DEH | 0 | - | - | X | X | X | 0 | 0 |
| Register page pointer | PP | 223 | DFH | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

## NOTES:

1. An ' $x$ ' means that the bit value is undefined following reset.
2. A dash ('-') means that the bit is neither used nor mapped, but the bit is read as "0".

## POWER-DOWN MODES

## STOP MODE

Stop mode is invoked by the instruction STOP (opcode 7FH). In Stop mode, the operation of the CPU and all peripherals is halted. That is, the on-chip main oscillator stops and the supply current is reduced to less than $3 \mu \mathrm{~A}$. All system functions stop when the clock "freezes", but data stored in the internal register file is retained. Stop mode can be released in one of two ways: by a reset or by interrupts, for more details see Figure 7-6.

## NOTE

Do not use stop mode if you are using an external clock source because $X_{I N}$ input must be restricted internally to $\mathrm{V}_{\mathrm{SS}}$ to reduce current leakage.

## Using nRESET to Release Stop Mode

Stop mode is released when the nRESET signal is released and returns to high level: all system and peripheral control registers are reset to their default hardware values and the contents of all data registers are retained. A reset operation automatically selects a slow clock fxx/16 because CLKCON. 3 and CLKCON. 4 are cleared to 'OOB'. After the programmed oscillation stabilization interval has elapsed, the CPU starts the system initialization routine by fetching the program instruction stored in ROM location 0100H (and 0101H)

## Using an External Interrupt to Release Stop Mode

External interrupts with an RC-delay noise filter circuit can be used to release Stop mode. Which interrupt you can use to release Stop mode in a given situation depends on the microcontroller's current internal operating mode. The external interrupts in the S3C828B/F828B/C8289/F8289/C8285/F8285 interrupt structure that can be used to release Stop mode are:

- External interrupts P0.0-P0.7 (INT0-INT7)

Please note the following conditions for Stop mode release:

- If you release Stop mode using an external interrupt, the current values in system and peripheral control registers are unchanged except STPCON register.
- If you use an internal or external interrupt for Stop mode release, you can also program the duration of the oscillation stabilization interval. To do this, you must make the appropriate control and clock settings before entering Stop mode.
- When the Stop mode is released by external interrupt, the CLKCON. 4 and CLKCON. 3 bit-pair setting remains unchanged and the currently selected clock value is used.
- The external interrupt is serviced when the Stop mode release occurs. Following the IRET from the service routine, the instruction immediately following the one that initiated Stop mode is executed.

## Using an Internal Interrupt to Release Stop Mode

Activate any enabled interrupt, causing Stop mode to be released. Other things are same as using external interrupt.

## How to Enter into Stop Mode

Handling STPCON register then writing STOP instruction (keep the order).
LD STPCON,\#10100101B
STOP
NOP
NOP
NOP

## SMMSUNG

## IDLE MODE

Idle mode is invoked by the instruction IDLE (opcode 6FH). In idle mode, CPU operations are halted while some peripherals remain active. During idle mode, the internal clock signal is gated away from the CPU, but all peripherals timers remain active. Port pins retain the mode (input or output) they had at the time idle mode was entered.

There are two ways to release idle mode:

1. Execute a reset. All system and peripheral control registers are reset to their default values and the contents of all data registers are retained. The reset automatically selects the slow clock fxx/16 because CLKCON. 4 and CLKCON. 3 are cleared to 'OOB'. If interrupts are masked, a reset is the only way to release idle mode.
2. Activate any enabled interrupt, causing idle mode to be released. When you use an interrupt to release idle mode, the CLKCON. 4 and CLKCON. 3 register values remain unchanged, and the currently selected clock value is used. The interrupt is then serviced. When the return-from-interrupt (IRET) occurs, the instruction immediately following the one that initiated idle mode is executed.

I/O PORTS

## OVERVIEW

The S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller has nine bit-programmable I/O ports, P0-P8. The port 1 is a 7 -bit port, the port 3 is a 6 -bit port, the port 7 is a 4 -bit port, and the others are 8 -bit ports. This gives a total of 65 I/O pins. Each port can be flexibly configured to meet application design requirements. The CPU accesses ports by directly writing or reading port registers. No special I/O instructions are required.

Table 9-1 gives you a general overview of the S3C828B/F828B/C8289/F8289/C8285/F8285 I/O port functions.
Table 9-1. S3C828B/F828B/C8289/F8289/C8285/F8285 Port Configuration Overview

| Port | Configuration Options |

## PORT DATA REGISTERS

Table 9-2 gives you an overview of the register locations of all four S3C828B/F828B/C8289/F8289/C8285/F8285 I/O port data registers. Data registers for ports $0,1,2,3,4,5,6,7$ and 8 have the general format shown in Figure 9-1.

Table 9-2. Port Data Register Summary

| Register Name | Mnemonic | Decimal | Hex | Location | R/W |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Port 0 data register | P0 | 240 | F0H | Set 1, Bank 1 | R/W |
| Port 1 data register | P1 | 241 | F1H | Set 1, Bank 1 | R/W |
| Port 2 data register | P2 | 242 | F2H | Set 1, Bank 1 | R/W |
| Port 3 data register | P3 | 243 | F3H | Set 1, Bank 1 | R/W |
| Port 4 data register | P4 | 244 | F4H | Set 1, Bank 1 | R/W |
| Port 5 data register | P5 | 245 | F5H | Set 1, Bank 1 | R/W |
| Port 6 data register | P6 | 246 | F6H | Set 1, Bank 1 | R/W |
| Port 7 data register | P7 | 247 | F7H | Set 1, Bank 1 | R/W |
| Port 8 data register | P8 | 248 | F8H | Set 1, Bank 1 | R/W |

## PORT 0

Port 0 is an 8-bit I/O Port that you can use two ways:

- General-purpose I/O
- External interrupt inputs for INT0-INT7

Port 0 is accessed directly by writing or reading the port 0 data register, P 0 at location FOH in set 1 , bank 1.

## Port 0 Control Register (P0CONH, P0CONL)

Port 0 has two 8-bit control registers: P0CONH for P0.4-P0.7 andP0CONL for P0.0-P0.3. A reset clears the POCONH and POCONL registers to " 00 H ", configuring all pins to input mode. In input mode, three different selections are available:

- Schmitt trigger input with interrupt generation on falling signal edges.
- Schmitt trigger input with interrupt generation on rising signal edges.
- Schmitt trigger input with interrupt generation on falling/rising signal edges.

## Port 0 Interrupt Enable and Pending Registers (POINTH, POINTL)

To process external interrupts at the port 0 pins, the additional control registers are provided: the port 0 interrupt enable register POINTH (high byte, E2H, set 1, bank 1), POINTL (Low byte, E3H, set1, bank1) and the port 0 interrupt pending register POPND (E4H, set 1, bank 1).

The port 0 interrupt pending register POPND lets you check for interrupt pending conditions and clear the pending condition when the interrupt service routine has been initiated. The application program detects interrupt requests by polling the POPND register at regular intervals.

When the interrupt enable bit of any port 0 pin is " 1 ", a rising or falling signal edge at that pin will generate an interrupt request. The corresponding POPND bit is then automatically set to " 1 " and the IRQ level goes low to signal the CPU that an interrupt request is waiting. When the CPU acknowledges the interrupt request, application software must the clear the pending condition by writing a " 0 " to the corresponding POPND bit.

## PORT 1

Port 1 is an 7-bit I/O port with individually configurable pins. Port 1 pins are accessed directly by writing or reading the port 1 data register, P1 at location F1H in set 1, bank 1. P1.0-P1.6 can serve inputs, as outputs (push pull or open-drain) or you can configure the following alternative functions:
— Low-byte pins (P1.0-P1.3): T1CAP, T1CLK, T1OUT, T1PWM, BUZ
— High-byte pins (P1.4-P1.6): SO, SCK, SI

## Port 1 Control Register (P1CONH, P1CONL)

Port 1 has two 8-bit control registers: P1CONH for P1.4-P1.6 and P1CONL for P1.0-P1.3. A reset clears the P1CONH and P1CONL registers to " 00 H ", configuring all pins to input mode. You use control registers settings to select input or output mode (push-pull or open drain) and enable the alternative functions.

When programming the port, please remember that any alternative peripheral I/O function you configure using the port 1 control registers must also be enabled in the associated peripheral module.

## Port 1 Pull-up Resistor Enable Register (P1PUR)

Using the port 1 pull-up resistor enable register, P1PUR (E7H, set 1, bank 1), you can configure pull-up resistors to individual port 1 pins.

Figure 9-6. Port 1 High-Byte Control Register (P1CONH)

Figure 9-7. Port 1 Low-Byte Control Register (P1CONL)
$\square$
Figure 9-8. Port 1 Pull-up Resistor Enable Register (P1PUR)

## PORT 2

Port 2 is an 8-bit I/O port that can be used for general-purpose I/O as A/D converter inputs, ADC0-ADC7. The pins are accessed directly by writing or reading the port 2 data register, P2 at location F2H in set 1, bank 1.

P2.0-P2.7 can serve as inputs, as outputs (push-pull) or you can configure the following alternative functions. In input mode, ADC or external reference voltage input are also available.

- Low byte pins (P2.0-P2.3): AD0-AD3
- High byte pins (P2.4-P2.7): AD4-AD7, $\mathrm{V}_{\text {BLDREF }}$

## Port 2 Control Registers (P2CONH, P2CONL)

Port 2 has two 8-bit control registers: P2CONH for P2.4-P2.7 and P2CONL for P2.0-P2.3. A reset clears the P 2 CONH and P 2 CONL registers also control the alternative functions.

Figure 9-9. Port 2 High-Byte Control Register (P2CONH)

Figure 9-10. Port 2 Low-Byte Control Register (P2CONL)

## PORT 3

Port 3 is an 6-bit l/O port with individually configurable pins. Port 3 pins are accessed directly by writing or reading the port 3 data register, P3 at location F3H in set 1, bank 1. P3.0-P3.5 can serve as inputs (with or without pullups), as push-pull outputs. And the P3.0-P3.3 can serve as segment pins for LCD or you can configure the following alternative functions:
— Low-byte pins (P3.0-P3.3): TBPWM, TAOUT, TAPWM, TACLK, TACAP

- High-byte pins (P3.4-P3.6): TxD, RxD

## Port 3 Control Registers (P3CONH, P3CONL)

Port 3 has two 8-bit control registers: P3CONH for P3.4-P3.5 and P3CONL for P3.0-P3.3. A reset clears the P3CONH and P3CONL registers to "OOH", configuring all pins to input mode. You use control registers settings to select input or output mode, enable pull-up resistors, and enable the alternative functions.

When programming this port, please remember that any alternative peripheral I/O function you configure using the port 3 control registers must also be enabled in the associated peripheral module.

Port 3 Control high Register, High Byte (P3CONH)

| :--- | :--- |

1 Enable SEG35 output at P3.1

| 0 | Enable TBPWM output at P3.0 |
| :--- | :--- |

1 Enable SEG34 output at P3.0

NOTE: The TAOUT, TAPWM or SEG35 outputs depend on P3CONL.3-P3CONL. 2. The TBPWM or SEG34 outputs depend on P3CONL.1-P3CONL.0.

Figure 9-11. Port 3 High-Byte Control Register (P3CONH)

Figure 9-12. Port 3 Low-Byte Control Register (P3CONL)

## PORT 4

Port 4 is an 8-bit l/O port with individually configurable pins. Port 4 pins are accessed directly by writing or reading the port 4 data register, P4 at location F4H in set 1, bank 1. P4.0-P4.7 can serve as inputs (with or without pullups), as output (open drain or push-pull). And, they can serve as segment pins for LCD also.

## Port 4 Control Registers (P4CONH, P4CONL)

Port 4 has two 8-bit control registers: P4CONH for P4.4-P4.7 and P4CONL for P4.0-P4.3. A reset clears the P 4 CONH and P 4 CONL registers to " 00 H ", configuring all pins to input mode.

## Port 4 Pull-up Resistor Enable Register (P4PUR)

Using the Port 4 pull-up resistor enable register, P4PUR (EEH, set 1, bank 1), you can configure pull-up resistors to individual port 4 pins.

Figure 9-13. Port 4 High-Byte Control Register (P4CONH)

Figure 9-14. Port 4 Low-Byte Control Register (P4CONL)

Figure 9-15. Port 4 Pull-up Resistor Enable Register (P4PUR)

## PORT 5

Port 5 is an 8-bit l/O port with individually configurable pins. Port 5 pins are accessed directly by writing or reading the port 5 data register, P5 at location F5H in set 1, bank 1. P5.0-P5.7 can serve as inputs (with without pull-ups), as output (open drain or push-pull). And, they can serve as segment pins for LCD also.

## Port 5 Control Registers (P5CONH, P5CONL)

Port 5 has two 8-bit control registers: P5CONH for P5.4-P5.7 and P5CONL for P5.0-P5.3. A reset clears the P5CONH and P5CONL registers to "00H", configuring all pins to input mode.

## Port 5 Pull-up Resistor Enable Register (P5PUR)

Using the port 5 pull-up resistor enable register, P5PUR (EFH, set1, bank1), you can configure pull-up resistors to individual port 5 pins.

Figure 9-16. Port 5 High-Byte Control Register (P5CONH)

Figure 9-17. Port 5 Low-Byte Control Register (P5CONL)

Figure 9-18. Port 5 Pull-up Resistor Enable Register (P5PUR)

## PORT 6

Port 6 is an 8-bit l/O port with individually configurable pins. Port 6 pins are accessed directly by writing or reading the port 5 data register, P6 at location F6H in set 1, bank 1. P6.0-P6.7 can serve as inputs (with without pull-ups), as push-pull outputs. And, they can serve as segment pins for LCD also.

## Port 6 Control Registers (P6CONH, P6CONL)

Port 6 has two 8-bit control registers: P6CONH for P6.4-P6.7 and P6CONL for P6.0-P6.3. A reset clears the P6CONH and P6CONL registers to " 00 H ", configuring all pins to input mode.

Figure 9-19. Port 6 High-byte Control Register (P6CONH)

Figure 9-20. Port 6 Low-byte Control Register (P6CONL)

## PORT 7

Port 7 is an 4-bit l/O port with individually configurable pins. Port 7 pins are accessed directly by writing or reading the port 7 data register, P7 at location F7H in set 1, bank 1. P7.0-P7.3 can serve as inputs (with without pull-ups), as push-pull outputs. And, they can serve as segment pins for LCD also.

## Port 7 Control Registers (P7CON)

Port 7 has a 8-bit control registers: P7CON for P7.0-P7.3. A reset clears the P7CON register to " 00 H ", configuring all pins to input mode.

Figure 9-21. Port 7 Control Register (P7CON)

## PORT 8

Port 8 is an 8 -bit I/O port with individually configurable pins. Port 8 pins are accessed directly by writing or reading the port 8 data register, P8 at location F8H in set 1, bank 1. P8.0-P8.7 can serve as inputs (with without pull-ups), as push-pull outputs. And, they can serve as segment pins for LCD also.

## Port 8 Control Registers (P8CON)

Port 8 has a 8 -bit control registers: P8CON for P8.0-P8.7. A reset clears the P8CON register to " 00 H ", configuring all pins to input mode.

| P8CON bit-pair pin configuration settings: |  |

Figure 9-22. Port 8 Control Register (P8CON)

## 10 <br> BASIC TIMER

## OVERVIEW

S3C828B/F828B/C8289/F8289/C8285/F8285 has an 8-bit basic timer.

## BASIC TIMER (BT)

You can use the basic timer (BT) in two different ways:

- As a watchdog timer to provide an automatic reset mechanism in the event of a system malfunction.
- To signal the end of the required oscillation stabilization interval after a reset or a Stop mode release.

The functional components of the basic timer block are:

- Clock frequency divider (fxx divided by 4096, 1024, 128, or 16) with multiplexer
- 8-bit basic timer counter, BTCNT (set 1, Bank 0, FDH, read-only)
- Basic timer control register, BTCON (set 1, D3H, read/write)

## BASIC TIMER CONTROL REGISTER (BTCON)

The basic timer control register, BTCON, is used to select the input clock frequency, to clear the basic timer counter and frequency dividers, and to enable or disable the watchdog timer function. It is located in set 1, address D3H, and is read/write addressable using Register addressing mode.

A reset clears BTCON to " 00 H ". This enables the watchdog function and selects a basic timer clock frequency of fxx/4096. To disable the watchdog function, you must write the signature code "1010B" to the basic timer register control bits BTCON.7-BTCON.4.

The 8-bit basic timer counter, BTCNT (set 1, bank 0, FDH), can be cleared at any time during the normal operation by writing a "1" to BTCON.1. To clear the frequency dividers, write a "1" to BTCON.0.

Figure 10-1. Basic Timer Control Register (BTCON)

## BASIC TIMER FUNCTION DESCRIPTION

## Watchdog Timer Function

You can program the basic timer overflow signal (BTOVF) to generate a reset by setting BTCON.7-BTCON. 4 to any value other than "1010B". (The "1010B" value disables the watchdog function.) A reset clears BTCON to " 00 H ", automatically enabling the watchdog timer function. A reset also selects the CPU clock (as determined by the current CLKCON register setting), divided by 4096, as the BT clock.

The MCU is resented whenever a basic timer counter overflow occurs, During normal operation, the application program must prevent the overflow, and the accompanying reset operation, from occurring, To do this, the BTCNT value must be cleared (by writing a " 1 " to BTCON.1) at regular intervals.

If a system malfunction occurs due to circuit noise or some other error condition, the BT counter clear operation will not be executed and a basic timer overflow will occur, initiating a reset. In other words, during the normal operation, the basic timer overflow loop (a bit 7 overflow of the 8 -bit basic timer counter, BTCNT) is always broken by a BTCNT clear instruction. If a malfunction does occur, a reset is triggered automatically.

## Oscillation Stabilization Interval Timer Function

You can also use the basic timer to program a specific oscillation stabilization interval after a reset or when stop mode has been released by an external interrupt.

In stop mode, whenever a reset or an external interrupt occurs, the oscillator starts. The BTCNT value then starts increasing at the rate of fxx/4096 (for reset), or at the rate of the preset clock source (for an external interrupt). When BTCNT. 4 overflows, a signal is generated to indicate that the stabilization interval has elapsed and to gate the clock signal off to the CPU so that it can resume the normal operation.

In summary, the following events occur when stop mode is released:

1. During the stop mode, a power-on reset or an external interrupt occurs to trigger the Stop mode release and oscillation starts.
2. If a power-on reset occurred, the basic timer counter will increase at the rate of $\mathrm{fxx} / 4096$. If an interrupt is used to release stop mode, the BTCNT value increases at the rate of the preset clock source.
3. Clock oscillation stabilization interval begins and continues until bit 4 of the basic timer counter overflows.
4. When a BTCNT. 4 overflow occurs, the normal CPU operation resumes.

NOTE: During a power-on reset operation, the CPU is idle during the required oscillation stabilization interval (until bit 4 of the basic timer counter overflows).

Figure 10-2. Basic Timer Block Diagram

## 11 <br> 8-BIT TIMER A/B

## 8-BIT TIMER A

## OVERVIEW

The 8-bit timer A is an 8-bit general-purpose timer/counter. Timer A has three operating modes, one of which you select using the appropriate TACON setting:

- Interval timer mode (Toggle output at TAOUT pin)
- Capture input mode with a rising or falling edge trigger at the TACAP pin
- PWM mode (TAPWM)

Timer A has the following functional components:

- Clock frequency divider (fxx divided by 1024, 256, 64, 8 or 1) with multiplexer
- External clock input pin (TACLK)
- 8-bit counter (TACNT), 8-bit comparator, and 8-bit reference data register (TADATA)
- I/O pins for capture input (TACAP) or PWM or match output (TAPWM, TAOUT)
- Timer A overflow interrupt (IRQ0, vector DEH) and match/capture interrupt (IRQ0, vector DCH) generation
- Timer A control register, TACON (set 1, Bank 0, E8H, read/write)

## TIMER A CONTROL REGISTER (TACON)

You use the timer A control register, TACON, to

- Select the timer A operating mode (interval timer, capture mode, or PWM mode)
- Select the timer A input clock frequency
- Clear the timer A counter, TACNT
- Enable the timer A overflow interrupt or timer A match/capture interrupt
- Clear timer A match/capture interrupt pending condition

TACON is located in set 1 , Bank 0 at address E 8 H , and is read/write addressable using Register addressing mode.

A reset clears TACON to ' $00 \mathrm{H}^{\prime}$ '. This sets timer A to normal interval timer mode, selects an input clock frequency of fxx/1024, and disables all timer A interrupts. You can clear the timer A counter at any time during normal operation by writing a " 1 " to TACON.2.

The timer A overflow interrupt (TAOVF) is interrupt level IRQ0 and has the vector address DEH. When a timer A overflow interrupt occurs and is serviced by the CPU, the pending condition is cleared automatically by hardware or must be cleared by software.

To enable the timer A match/capture interrupt (IRQ0, vector DCH), you must write TACON. 1 to "1". To detect a match/capture interrupt pending condition, the application program polls INTPND.1. When a " 1 " is detected, a timer A match or capture interrupt is pending. When the interrupt request has been serviced, the pending condition must be cleared by software by writing a " 0 " to the timer A match/capture interrupt pending bit, INTPND. 1.

Figure 11-1. Timer A Control Register (TACON)

## TIMER A FUNCTION DESCRIPTION

## Timer A Interrupts (IRQ0, Vectors DCH and DEH)

The timer A can generate two interrupts: the timer A overflow interrupt (TAOVF), and the timer A match/ capture interrupt (TAINT). TAOVF is interrupt level IRQ0, vector DEH. TAINT also belongs to interrupt level IRQ0, but is assigned the separate vector address, DCH.

A timer A overflow interrupt pending condition is automatically cleared by hardware when it has been serviced or should be cleared by software in the interrupt service routine by writing a " 0 " to the INTPND. 0 interrupt pending bit. However, the timer A match/capture interrupt pending condition must be cleared by the application's interrupt service routine by writing a " 0 " to the INTPND. 1 interrupt pending bit.

## Interval Timer Mode

In interval timer mode, a match signal is generated when the counter value is identical to the value written to the timer A reference data register, TADATA. The match signal generates a timer A match interrupt (TAINT, vector DCH) and clears the counter.

If, for example, you write the value " 10 H " to TADATA, the counter will increment until it reaches " 10 H ". At this point, the timer A interrupt request is generated, the counter value is reset, and counting resumes. With each match, the level of the signal at the timer A output pin is inverted (see Figure 11-2).

Figure 11-2 Simplified Timer A Function Diagram: Interval Timer Mode

## Pulse Width Modulation Mode

Pulse width modulation (PWM) mode lets you program the width (duration) of the pulse that is output at the TAPWM pin. As in interval timer mode, a match signal is generated when the counter value is identical to the value written to the timer A data register. In PWM mode, however, the match signal does not clear the counter. Instead, it runs continuously, overflowing at "FFH", and then continues incrementing from " 00 H ".

Although you can use the match signal to generate a timer A overflow interrupt, interrupts are not typically used in PWM-type applications. Instead, the pulse at the TAPWM pin is held to Low level as long as the reference data value is less than or equal to $(\leq)$ the counter value and then the pulse is held to High level for as long as the data value is greater than $(>)$ the counter value. One pulse width is equal to $t_{C L K} \times 256$ (see Figure 11-3).

Figure 11-3. Simplified Timer A Function Diagram: PWM Mode

## Capture Mode

In capture mode, a signal edge that is detected at the TACAP pin opens a gate and loads the current counter value into the timer A data register. You can select rising or falling edges to trigger this operation.

Timer A also gives you capture input source: the signal edge at the TACAP pin. You select the capture input by setting the values of the timer A capture input selection bits in the port 3 control register, P3CONL.7-.6, (set 1, bank 1, EBH). When P3CONL.7-. 6 is "00", the TACAP input is selected.

Both kinds of timer A interrupts can be used in capture mode: the timer A overflow interrupt is generated whenever a counter overflow occurs; the timer A match/capture interrupt is generated whenever the counter value is loaded into the timer A data register.

By reading the captured data value in TADATA, and assuming a specific value for the timer A clock frequency, you can calculate the pulse width (duration) of the signal that is being input at the TACAP pin (see Figure 11-4).

Figure 11-4. Simplified Timer A Function Diagram: Capture Mode

## BLOCK DIAGRAM

Figure 11-5. Timer A Functional Block Diagram

## 8-BIT TIMER B

## OVERVIEW

The S3C828B/F828B/C8289/F8289/C8285/F8285 micro-controller has an 8-bit counter called timer B. Timer B, which can be used to generate the carrier frequency of a remote controller signal.
Pending condition of timer B is cleared automatically by hardware.
Timer B has two functions:

- As a normal interval timer, generating a timer B interrupt at programmed time intervals.
- To supply a clock source to the 8-bit timer/counter module, timer B, for generating the timer B overflow interrupt.

Figure 11-6. Timer B Control Register

## BLOCK DIAGRAM

Figure 11-7. Timer B Functional Block Diagram

## TIMER B PULSE WIDTH CALCULATIONS

To generate the above repeated waveform consisted of low period time, $\mathrm{t}_{\text {LOW }}$, and high period time, $\mathrm{t}_{\text {HIGH }}$.
When TBOF $=0$,
$t_{\text {Low }}=($ TBDATAL +2$) \times 1 / \mathrm{fx}, 0 \mathrm{H}<$ TBDATAL $<100 \mathrm{H}$, where $\mathrm{fx}=$ The selected clock.
$\mathrm{t}_{\text {HIGH }}=($ TBDATAH +2$) \times 1 / \mathrm{fx}, 0 \mathrm{H}<$ TBDATAH $<100 \mathrm{H}$, where $\mathrm{fx}=$ The selected clock.
When TBOF = 1 ,
$\mathrm{t}_{\text {Low }}=($ TBDATAH +2$) \times 1 / \mathrm{fx}, 0 \mathrm{H}<$ TBDATAH $<100 \mathrm{H}$, where $\mathrm{fx}=$ The selected clock.
$\mathrm{t}_{\text {HIGH }}=($ TBDATAL +2$) \times 1 / \mathrm{fx}, 0 \mathrm{H}<$ TBDATAL $<100 \mathrm{H}$, where $\mathrm{fx}=$ The selected clock.

To make $\mathrm{t}_{\text {LOW }}=24$ us and $\quad \mathrm{t}_{\mathrm{HIGH}}=15 \mathrm{us} . \quad \mathrm{f}_{\mathrm{OSC}}=4 \mathrm{MHz}, \mathrm{fx}=4 \mathrm{MHz} / 4=1 \mathrm{MHz}$
When TBOF $=0$,
$\mathrm{t}_{\text {Low }}=24 \mathrm{us}=($ TBDATAL +2$) / \mathrm{fx}=($ TBDATAL +2$) \times 1 \mathrm{us}$, TBDATAL $=22$.
$\mathrm{t}_{\mathrm{HIGH}}=15 \mathrm{us}=($ TBDATAH +2$) / \mathrm{fx}=($ TBDATAH +2$) \times 1 \mathrm{us}$, TBDATAH $=13$.
When TBOF = 1 ,
$\mathrm{t}_{\mathrm{HIGH}}=15 \mathrm{us}=($ TBDATAL +2$) / \mathrm{fx}=($ TBDATAL +2$) \times 1 \mathrm{us}$, TBDATAL $=13$.
$\mathrm{t}_{\text {Low }}=24 \mathrm{us}=($ TBDATAH +2$) / \mathrm{fx}=($ TBDATAH +2$) \times 1 \mathrm{us}$, TBDATAH $=22$.

Figure 11-8. Timer B Output Flip-Flop Waveforms in Repeat Mode
$\qquad$

## PROGRAMMING TIP - To generate 38 kHz, 1/3duty signal through P3.0

This example sets Timer B to the repeat mode, sets the oscillation frequency as the Timer B clock source, and TBDATAH and TBDATAL to make a $38 \mathrm{kHz}, 1 / 3$ Duty carrier frequency. The program parameters are:

- Timer B is used in repeat mode
- Oscillation frequency is $4 \mathrm{MHz}(0.25 \mu \mathrm{~s})$
- TBDATAH $=8.795 \mu \mathrm{~s} / 0.25 \mu \mathrm{~s}=35.18$, TBDATAL $=17.59 \mu \mathrm{~s} / 0.25 \mu \mathrm{~s}=70.36$
- Set P3.0 to TBPWM mode.

START
ORG
0100H
; Reset address

; Select repeat mode for Timer B.
; Start Timer B operation.
; Set Timer B Output flip-flop (TBOF) high.
LD P3CONL,\#02H ; Set P3.0 to TBPWM mode.
; This command generates $38 \mathrm{kHz}, 1 / 3$ duty pulse signal through P3.0.

## PROGRAMMING TIP - To generate a one pulse signal through P3.0

This example sets Timer B to the one shot mode, sets the oscillation frequency as the Timer B clock source, and TBDATAH and TBDATAL to make a $40 \mu \mathrm{~s}$ width pulse. The program parameters are:

- Timer B is used in one shot mode
- Oscillation frequency is 4 MHz ( 1 clock $=0.25 \mu \mathrm{~s}$ )
— TBDATAH $=40 \mu \mathrm{~s} / 0.25 \mu \mathrm{~s}=160$, TBDATAL $=1$
- Set P3.0 to TBPWM mode

|  | ORG | 0100H | Reset address |
| :---: | :---: | :---: | :---: |
| START | DI |  |  |
|  | - |  |  |
|  | - |  |  |
|  | - |  |  |
|  | LD | TBDATAH,\# (160-2) | Set $40 \mu \mathrm{~s}$ |
|  | LD | TBDATAL,\# 1 | Set any value except 00H |
|  | LD | TBCON,\#00000001B | Clock Source $\leftarrow \mathrm{f}_{\text {OSC }}$ |
|  |  |  | Disable Timer B interrupt. |
|  |  |  | Select one shot mode for Timer B. |
|  |  |  | Stop Timer B operation. |
|  |  |  | Set Timer B output flip-flop (TBOF) high |
|  | LD | P3CONL, \#02H | Set P3.0 to TBPWM mode. |
|  | - |  |  |
|  | - |  |  |
| Pulse_out: | LD | TBCON,\#00000101B |  |
|  |  |  | to make the pulse at this point. |
|  | - |  | After the instruction is executed, $0.75 \mu$ is required |
|  | - |  | before the falling edge of the pulse starts. |

16-BIT TIMER 0/1

## 16-BIT TIMER 0

## OVERVIEW

The 16 -bit timer 0 is an 16-bit general-purpose timer. Timer 0 has the interval timer mode by using the appropriate TOCON setting.

Timer 0 has the following functional components:

- Clock frequency divider (fxx divided by 256, 64, 8, or 1) with multiplexer
- TBOF (from timer B) is one of the clock frequencies.
- 16-bit counter (TOCNTH/L), 16-bit comparator, and 16-bit reference data register (TODATAH/L)
- Timer 0 interrupt (IRQ2, vector E2H) generation
- Timer 0 control register, TOCON (set 1, Bank 0, E3H, read/write)

## FUNCTION DESCRIPTION

## Interval Timer Function

The timer 0 module can generate an interrupt, the timer 0 match interrupt (TOINT). TOINT belongs to interrupt level IRQ2, and is assigned the separate vector address, E2H.

The TOINT pending condition is automatically cleared by hardware when it has been serviced. Even though TOINT is disabled, the application's service routine can detect a pending condition of TOINT by the software and execute it's sub-routine. When this case is used, the TOINT pending bit must be cleared by the application subroutine by writing a " 0 " to the TOCON. 0 pending bit.

In interval timer mode, a match signal is generated when the counter value is identical to the values written to the T0 reference data registers, TODATAH/L. The match signal generates a timer 0 match interrupt (TOINT, vector E 2 H ) and clears the counter.

If, for example, you write the value 0010 H to TODATAH/L and OFH to T0CON, the counter will increment until it reaches 10 H . At this point, the T0 interrupt request is generated, the counter value is reset, and counting resumes.

## TIMER 0 CONTROL REGISTER (TOCON)

You use the timer 0 control register, TOCON, to

- Enable the timer 0 operating (interval timer)
- Select the timer 0 input clock frequency
- Clear the timer 0 counter, TOCNT
- Enable the timer 0 interrupt and clear timer 0 interrupt pending condition

TOCON is located in set 1 , bank 0 , at address E 3 H , and is read/write addressable using register addressing mode.

A reset clears TOCON to " 00 H ". This sets timer 0 to disable interval timer mode, selects the TBOF, and disables timer 0 interrupt. You can clear the timer 0 counter at any time during normal operation by writing a " 1 " to TOCON. 3

To enable the timer 0 interrupt (IRQ2, vector E2H), you must write TOCON.2, and TOCON. 1 to "1". To generate the exact time interval, you should write TOCON. 3 and 0 , which cleared counter and interrupt pending bit. To detect an interrupt pending condition when TOINT is disabled, the application program polls pending bit, TOCON.O. When a " 1 " is detected, a timer 0 interrupt is pending. When the TOINT sub-routine has been serviced, the pending condition must be cleared by software by writing a " 0 " to the timer 0 interrupt pending bit, TOCON. 0 .

## BLOCK DIAGRAM

Figure 12-2. Timer 0 Functional Block Diagram

## 16-BIT TIMER 1

## OVERVIEW

The 16 -bit timer 1 is an 16-bit general-purpose timer/counter. Timer 1 has three operating modes, one of which you select using the appropriate T1CON setting:

- Interval timer mode (Toggle output at T1OUT pin)
- Capture input mode with a rising or falling edge trigger at the T1CAP pin
- PWM mode (T1PWM)

Timer 1 has the following functional components:

- Clock frequency divider (fxx divided by 1024, 256, 64, 8, or 1) with multiplexer
- External clock input pin (T1CLK)
- 16-bit counter (T1CNTH/L), 16-bit comparator, and 16-bit reference data register (T1DATAH/L)
- I/O pins for capture input (T1CAP), or PWM or match output (T1PWM, T1OUT)
- Timer 1 overflow interrupt (IRQ3, vector E6H) and match/capture interrupt (IRQ3, vector E4H) generation
- Timer 1 control register, T1CON (set 1, Bank 0, EBH, read/write)

## TIMER 1 CONTROL REGISTER (T1CON)

You use the timer 1 control register, T1CON, to

- Select the timer 1 operating mode (interval timer, capture mode, or PWM mode)
- Select the timer 1 input clock frequency
- Clear the timer 1 counter, T1CNTH/T1CNTL
- Enable the timer 1 overflow interrupt or timer 1 match/capture interrupt
- Clear timer 1 match/capture interrupt pending conditions

T1CON is located in set 1 and Bank 0 at address EBH, and is read/write addressable using Register addressing mode.

A reset clears T1CON to ' 00 H '. This sets timer 1 to normal interval timer mode, selects an input clock frequency of $\mathrm{fxx} / 1024$, and disables all timer 1 interrupts. To disable the counter operation, please set T1CON.7-. 5 to 111B. You can clear the timer 1 counter at any time during normal operation by writing a " 1 " to T1CON. 3.
The timer 1 overflow interrupt (T1OVF) is interrupt level IRQ3 and has the vector address E6H. When a timer 1 overflow interrupt occurs and is serviced interrupt (IRQ3, vector E4H), you must write T1CON. 1 to "1". To generate the exact time interval, you should write T1CON by the CPU, the pending condition is cleared automatically by hardware.

To enable the timer 1 match/capture which clear counter and interrupt pending bit. To detect a match/capture or overflow interrupt pending condition when T1INT or T1OVF is disabled, the application program should poll the pending bit. When a " 1 " is detected, a timer 1 match/capture or overflow interrupt is pending.
When her sub-routine has been serviced, the pending condition must be cleared by software by writing a " 0 " to the interrupt pending bit.

Figure 12-3. Timer 1 Control Register (T1CON)

## TIMER 1 FUNCTION DESCRIPTION

## Timer 1 Interrupts (IRQ2, Vectors E4H and E6H)

The timer 1 can generate two interrupts: the timer 1 overflow interrupt (T1OVF), and the timer 1 match/ capture interrupt (T3INT). T3OVF is belongs to interrupt level IRQ3, vector E6H. T1INT also belongs to interrupt level IRQ3, but is assigned the separate vector address, E4H.

A timer 1 overflow interrupt pending condition is automatically cleared by hardware when it has been serviced or should be cleared by software in the interrupt service routine by writing a " 0 " to the INTPND. 2 interrupt pending bit. However, the timer 1 match/capture interrupt pending condition must be cleared by the application's interrupt service routine by writing a "0" to the INTPND. 3 interrupt pending bit.

## Interval Timer Mode

In interval timer mode, a match signal is generated when the counter value is identical to the value written to the timer 1 reference data register, T1DATAH/T1DATAL. The match signal generates a timer 1 match interrupt (T1INT, vector E4H) and clears the counter.

If, for example, you write the value "1087H" to T1DATAH/T1DATAL, the counter will increment until it reaches " 1087 H ". At this point, the timer 1 interrupt request is generated, the counter value is reset, and counting resumes. With each match, the level of the signal at the timer 1 output pin is inverted (see Figure 12-4).

Figure 12-4. Simplified Timer 1 Function Diagram: Interval Timer Mode

## Pulse Width Modulation Mode

Pulse width modulation (PWM) mode lets you program the width (duration) of the pulse that is output at the T1PWM pin. As in interval timer mode, a match signal is generated when the counter value is identical to the value written to the timer 1 data register. In PWM mode, however, the match signal does not clear the counter. Instead, it runs continuously, overflowing at "FFFFH", and then continues incrementing from "0000H".

Although you can use the match signal to generate a timer 1 overflow interrupt, interrupts are not typically used in PWM-type applications. Instead, the pulse at the T1PWM pin is held to Low level as long as the reference data value is less than or equal to $(\leq)$ the counter value and then the pulse is held to High level for as long as the data value is greater than $(>)$ the counter value. One pulse width is equal to $t_{C L K} \times 65536$ (see Figure 12-5).

Figure 12-5. Simplified Timer 1 Function Diagram: PWM Mode

## Capture Mode

In capture mode, a signal edge that is detected at the T1CAP pin opens a gate and loads the current counter value into the timer 1 data register. You can select rising or falling edges to trigger this operation.

Timer 1 also gives you capture input source: the signal edge at the T1CAP pin. You select the capture input by setting the values of the timer 1 capture input selection bits in the port 1 control register, P1CONH.1-.0, (set 1, bank 1, E6H). When P1CONH.1-. 0 is "00", the T1CAP input is selected.

Both kinds of timer 1 interrupts can be used in capture mode: the timer 1 overflow interrupt is generated whenever a counter overflow occurs; the timer 1 match/capture interrupt is generated whenever the counter value is loaded into the timer 1 data register.

By reading the captured data value in T1DATAH/T1DATAL, and assuming a specific value for the timer 1 clock frequency, you can calculate the pulse width (duration) of the signal that is being input at the T1CAP pin (see Figure 12-6).

Figure 12-7. Timer 1 Functional Block Diagram

## 13 WATCH TIMER

## OVERVIEW

Watch timer functions include real-time and watch-time measurement and interval timing for the system clock. To start watch timer operation, set bit 1 of the watch timer control register, WTCON. 1 to " 1 ".
And if you want to service watch timer overflow interrupt (IRQ5, vector EEH), then set the WTCON. 6 to " 1 ".
The watch timer overflow interrupt pending condition (WTCON.0) must be cleared by software in the application's interrupt service routine by means of writing a "0" to the WTCON. 0 interrupt pending bit.
After the watch timer starts and elapses a time, the watch timer interrupt pending bit (WTCON.0) is automatically set to " 1 ", and interrupt requests commence in $3.91 \mathrm{~ms}, 0.25,0.5$ and 1 -second intervals by setting Watch timer speed selection bits (WTCON.3-.2).

The watch timer can generate a steady $0.5 \mathrm{kHz}, 1 \mathrm{kHz}, 2 \mathrm{kHz}$, or 4 kHz signal to BUZ output pin for Buzzer. By setting WTCON. 3 and WTCON. 2 to "11b", the watch timer will function in high-speed mode, generating an interrupt every 3.91 ms . High-speed mode is useful for timing events for program debugging sequences.

The watch timer supplies the clock frequency for the LCD controller ( $\mathrm{f}_{\mathrm{LCD}}$ ). Therefore, if the watch timer is disabled, the LCD controller does not operate.

Watch timer has the following functional components:

- Real Time and Watch-Time Measurement
- Using a Main Clock Source or Sub clock
- Clock Source Generation for LCD Controller (ficd)
- I/O pin for Buzzer Output Frequency Generator (BUZ)
- Timing Tests in High-Speed Mode
- Watch timer overflow interrupt (IRQ5, vector EEH) generation
- Watch timer control register, WTCON (set 1, bank 0, D1H, read/write)

## WATCH TIMER CONTROL REGISTER (WTCON)

The watch timer control register, WTCON is used to select the watch timer interrupt time and Buzzer signal, to enable or disable the watch timer function. It is located in set 1, bank 0 at address D1H, and is read/write addressable using register addressing mode.
A reset clears WTCON to " 00 H ". This disable the watch timer.
So, if you want to use the watch timer, you must write appropriate value to WTCON.

Figure 13-1. Watch Timer Control Register (WTCON)

## WATCH TIMER CIRCUIT DIAGRAM

## 14 LCD CONTROLLER/DRIVER

## OVERVIEW

The S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller can directly drive an up-to-256-dot (32 segments $\times 8$ commons) LCD panel. Its LCD block has the following components:

- LCD controller/driver
- Display RAM for storing display data
- 6 common/segment output pins (COM2/SEG0-COM7/SEG5)
- 32 segment output pins (SEG6-SEG37)
- 2 common output pins (COM0-COM1)
- Four LCD operating power supply pins $\left(\mathrm{V}_{\mathrm{LC}}-\mathrm{V}_{\mathrm{LC} 3}\right)$
- LCD bias by internal/external register

The LCD control register, LCON, is used to turn the LCD display on and off, switch the current to the dividing resistors for the LCD display, and frame frequency. Data written to the LCD display RAM can be automatically transferred to the segment signal pins without any program control.

When a subsystem clock is selected as the LCD clock source, the LCD display is enabled even in the main clock stop or idle mode.

Figure 14-1. LCD Function Diagram

## LCD CIRCUIT DIAGRAM

Figure 14-2. LCD Circuit Diagram

## LCD RAM ADDRESS AREA

RAM addresses of page 15 are used as LCD data memory. These locations can be addressed by 1-bit or 8-bit instructions. If the bit value of a display segment is "1", the LCD display is turned on. If the bit value is " 0 ", the display is turned off.

Display RAM data are sent out through the segment pins, SEG0-SEG37, using the direct memory access (DMA) method that is synchronized with the $\mathrm{f}_{\text {LCD }}$ signal. RAM addresses in this location that are not used for LCD display can be allocated to general-purpose use.

| COM | Bit | SEG0 | SEG1 | SEG2 | SEG3 | SEG4 | ------ | SEG36 | SEG37 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| COM0 | .0 |  |  |  |  |  |  |  |  |
| COM1 | .1 |  |  |  |  |  |  |  |  |
| COM2 | .2 |  |  |  |  |  |  |  |  |
| COM3 | .3 | F00H | F01H | F02H | F03H | F04H | ----- | F24H | F25H |
| COM4 | .4 |  |  |  |  |  |  |  |  |
| COM5 | .5 |  |  |  |  |  |  |  |  |
| COM6 | .6 |  |  |  |  |  |  |  |  |
| COM7 | .7 |  |  |  |  |  |  |  |  |

Figure 14-3. LCD Display Data RAM Organization

## LCD CONTROL REGISTER (LCON)

A LCON is located in page 15 of set1, bank0 at address DOH, and is read/write addressable using register addressing mode. It has the following control functions.

- LCD duty and bias selection
- LCD clock selection
- LCD display control
- Internal/External LCD dividing resistors selection

The LCON register is used to turn the LCD display on/off, to select duty and bias, to select LCD clock and control the flow of the current to the dividing in the LCD circuit. A reset clears the LCON registers to "00H", configuring turns off the LCD display, select $1 / 8$ duty and $1 / 4$ bias, select 128 Hz for LCD clock, and Enable internal LCD dividing resistors.

The LCD clock signal determines the frequency of COM signal scanning of each segment output. This is also referred as the LCD frame frequency. Since the LCD clock is generated by watch timer clock (fw). The watch timer should be enabled when the LCD display is turned on.

Figure 14-4. LCD Control Register (LCON)

## LCD VOLTAGE DIVIDING RESISTOR

NOTES:

1. $R=$ Internal LCD dividing resistors. The resistors can be disconnected by LCON.7.
2. $R^{\prime}=$ External LCD dividing resistors.
3. When $1 / 3$ bias is selected, the bias levels are set as VLCO, VLC1, VLC2(VLC3), and Vss.

Figure 14-5. LCD Voltage Dividing Resistor Connection

## COMMON (COM) SIGNALS

The common signal output pin selection (COM pin selection) varies according to the selected duty cycle.

- In 1/8 duty mode, COM0-COM7 (SEG6-SEG37) pins are selected.
- In 1/4 duty mode, COM0-COM3 (SEG2-SEG37) pins are selected.
- In 1/3 duty mode, COM0-COM2 (SEG1-SEG37) pins are selected.
- In 1/2 duty mode, COM0-COM1 (SEG0-SEG37) pins are selected.

## SEGMENT (SEG) SIGNALS

The 38 LCD segment signal pins are connected to corresponding display RAM locations at page 15 . Bits of the display RAM are synchronized with the common signal output pins.

When the bit value of a display RAM location is "1", a select signal is sent to the corresponding segment pin. When the display bit is " 0 ", a 'no-select' signal to the corresponding segment pin.

## 10-BIT ANALOG-TO-DIGITAL CONVERTER

## OVERVIEW

The 10-bit A/D converter (ADC) module uses successive approximation logic to convert analog levels entering at one of the eight input channels to equivalent 10-bit digital values. The analog input level must lie between the $A V_{\text {REF }}$ and $A V_{S S}$ values. The $A / D$ converter has the following components:

- Analog comparator with successive approximation logic
- D/A converter logic (resistor string type)
- ADC control register (ADCON)
- Eight multiplexed analog data input pins (AD0-AD7)
- 10-bit A/D conversion data output register (ADDATAH/L)
- 8-bit digital input port (Alternately, I/O port.)
- $A V_{\text {REF }}$ and $A V_{S S}$ pins, $A V_{S S}$ is internally connected to $V_{S S}$

## FUNCTION DESCRIPTION

To initiate an analog-to-digital conversion procedure, at the first you must set ADCEN signal for ADC input enable at port 2, the pin set with 1 can be used for ADC analog input. And you write the channel selection data in the A/D converter control register ADCON.4-. 6 to select one of the eight analog input pins (ADC0-7) and set the conversion start or enable bit, ADCON.0. The read-write ADCON register is located in set 1 , bank 0 , at address F3H. The pins which are not used for ADC can be used for normal I/O.

During a normal conversion, ADC logic initially sets the successive approximation register to 200 H (the approximate half-way point of an 10-bit register). This register is then updated automatically during each conversion step. The successive approximation block performs 10-bit conversions for one input channel at a time. You can dynamically select different channels by manipulating the channel selection bit value (ADCON.6-4) in the ADCON register. To start the A/D conversion, you should set the enable bit, ADCON.O. When a conversion is completed, ADCON.3, the end-of-conversion (EOC) bit is automatically set to 1 and the result is dumped into the ADDATAH/L register where it can be read. The A/D converter then enters an idle state. Remember to read the contents of ADDATAH/L before another conversion starts. Otherwise, the previous result will be overwritten by the next conversion result.

## NOTE

Because the A/D converter has no sample-and-hold circuitry, it is very important that fluctuation in the analog level at the AD0-AD7 input pins during a conversion procedure be kept to an absolute minimum. Any change in the input level, perhaps due to noise, will invalidate the result. If the chip enters to STOP or IDLE mode in conversion process, there will be a leakage current path in A/D block. You must use STOP or IDLE mode after ADC operation is finished.

## CONVERSION TIMING

The A/D conversion process requires 4 steps (4 clock edges) to convert each bit and 10 clocks to set-up A/D conversion. Therefore, total of 50 clocks are required to complete an 10-bit conversion: When fxx/8 is selected for conversion clock with an 8 MHz fxx clock frequency, one clock cycle is 1 us. Each bit conversion requires 4 clocks, the conversion rate is calculated as follows:

```
4 clocks/bit }\times10\mathrm{ bits + set-up time = 50 clocks, 50 clock }\times1\mathrm{ us = 50 }\mu\textrm{s}\mathrm{ at 1 MHz
```

## AID CONVERTER CONTROL REGISTER (ADCON)

The A/D converter control register, ADCON, is located at address F3H in set 1 , bank 0 . It has three functions:

- Analog input pin selection (ADCON.6-.4)
- End-of-conversion status detection (ADCON.3)
- ADC clock selection (ADCON.2-.1)
- A/D operation start or enable (ADCCON.0)

After a reset, the start bit is turned off. You can select only one analog input channel at a time. Other analog input pins (AD0-AD7) can be selected dynamically by manipulating the ADCON. $4-6$ bits. And the pins not used for analog input can be used for normal I/O function.

Figure 15-1. A/D Converter Control Register (ADCON)

Figure 15-2. A/D Converter Data Register (ADDATAH/L)

## INTERNAL REFERENCE VOLTAGE LEVELS

In the ADC function block, the analog input voltage level is compared to the reference voltage. The analog input level must remain within the range $A V_{S S}$ to $A V_{R E F}$ (usually, $A V_{R E F} \leq V_{D D}$ ).

Different reference voltage levels are generated internally along the resistor tree during the analog conversion process for each conversion step. The reference voltage level for the first conversion bit is always $1 / 2 A V_{R E F}$.

Figure 15-4. Recommended AID Converter Circuit for Highest Absolute Accuracy

## SERIAL I/O INTERFACE

## OVERVIEW

Serial I/O module, SIO can interface with various types of external device that require serial data transfer. The components of each SIO function block are:

- 8-bit control register (SIOCON)
- Clock selector logic
- 8-bit data buffer (SIODATA)
- 8-bit pre-scaler (SIOPS)
- 3-bit serial clock counter
- Serial data I/O pins (SI, SO)
- External clock input/output pins (SCK)

The SIO module can transmit or receive 8-bit serial data at a frequency determined by its corresponding control register settings. To ensure flexible data transmission rates, you can select an internal or external clock source.

## PROGRAMMING PROCEDURE

To program the SIO modules, follow these basic steps:

1. Configure the I/O pins at port $(\mathrm{SO}, \mathrm{SCK}, \mathrm{SI})$ by loading the appropriate value to the P 1 CONH register if necessary
2. Load an 8-bit value to the SIOCON control register to properly configure the serial I/O module. In this operation, SIOCON. 2 must be set to "1" to enable the data shifter.
3. For interrupt generation, set the serial I/O interrupt enable bit (SIOCON.1) to "1".
4. When you transmit data to the serial buffer, write data to SIODATA and set SIOCON. 3 to 1 , the shift operation starts.
5. When the shift operation (transmit/receive) is completed, the SIO pending bit (SIOCON.0) is set to "1" and an SIO interrupt request is generated.

## SIO CONTROL REGISTER (SIOCON)

The control register for serial I/O interface module, SIOCON, is located at EOH in set 1, bank 0. It has the control settings for SIO module.

- Clock source selection (internal or external) for shift clock
- Interrupt enable
- Edge selection for shift operation
- Clear 3-bit counter and start shift operation
- Shift operation (transmit) enable
- Mode selection (transmit/receive or receive-only)
- Data direction selection (MSB first or LSB first)

A reset clears the SIOCON value to " OOH ". This configures the corresponding module with an internal clock source at the SCK, selects receive-only operating mode, and clears the 3-bit counter. The data shift operation and the interrupt are disabled. The selected data direction is MSB-first.

Figure 16-1. Serial I/O Module Control Registers (SIOCON)

## SIO PRE-SCALER REGISTER (SIOPS)

The control register for serial I/O interface module, SIOPS, is located at E2H in set 1, bank 0.
The value stored in the SIO pre-scaler register, SIOPS, lets you determine the SIO clock rate (baud rate) as follows:

Baud rate $=$ Input clock $(f x x / 4) /($ Pre-scaler value +1$)$, or SCK input clock, where the input clock is $\mathrm{fxx} / 4$

Figure 16-2. SIO Pre-scaler Register (SIOPS)

## SERIAL I/O TIMING DIAGRAM

Figure 16-4. Serial I/O Timing in Transmit/Receive Mode (Tx at falling, SIOCON. $4=0$ )

Figure 16-5. Serial I/O Timing in Transmit/Receive Mode (Tx at rising, SIOCON. $4=1$ )

## 17 UART

## OVERVIEW

The UART block has a full-duplex serial port with programmable operating modes: There is one synchronous mode and three UART (Universal Asynchronous Receiver/Transmitter) modes:

- Serial I/O with baud rate of $\mathrm{fxx} /(16 \times(B R D A T A+1))$
- 8-bit UART mode; variable baud rate
- 9-bit UART mode; fxx/16
- 9-bit UART mode, variable baud rate

UART receive and transmit buffers are both accessed via the data register, UDATA, is set 1 , bank 0 at address F7H. Writing to the UART data register loads the transmit buffer; reading the UART data register accesses a physically separate receive buffer.

When accessing a receive data buffer (shift register), reception of the next byte can begin before the previously received byte has been read from the receive register. However, if the first byte has not been read by the time the next byte has been completely received, one of the bytes will be lost.

In all operating modes, transmission is started when any instruction (usually a write operation) uses the UDATA register as its destination address. In mode 0, serial data reception starts when the receive interrupt pending bit (INTPND.5) is " 0 " and the receive enable bit (UARTCON.4) is " 1 ". In mode 1,2 , and 3 , reception starts whenever an incoming start bit ("0") is received and the receive enable bit (UARTCON.4) is set to " 1 ".

## PROGRAMMING PROCEDURE

To program the UART modules, follow these basic steps:

1. Configure P3.5 and P3.4 to alternative function (RxD (P3.5), TxD (P3.4)) for UART module by setting the P3CONH register to appropriately value.
2. Load an 8-bit value to the UARTCON control register to properly configure the UART I/O module.
3. For interrupt generation, set the UART I/O interrupt enable bit (UARTCON. 1 or UARTCON.0) to "1".
4. When you transmit data to the UART buffer, write data to UDATA, the shift operation starts.
5. When the shift operation (transmit/receive) is completed, UART pending bit (INTPND. 4 or INTPND.5) is set to " 1 " and an UART interrupt request is generated.

## UART CONTROL REGISTER (UARTCON)

The control register for the UART is called UARTCON in set 1, bank 0 at address F 6 H . It has the following control functions:

- Operating mode and baud rate selection
- Multiprocessor communication and interrupt control
- Serial receive enable/disable control
- 9th data bit location for transmit and receive operations (modes 2 and 3 only)
- UART transmit and receive interrupt control

A reset clears the UARTCON value to " 00 H ". So, if you want to use UART module, you must write appropriate value to UARTCON.

NOTES:

1. In mode 2 or 3 , if the UARTCON. 5 bit is set to " 1 " then the receive interrupt will not be activated if the received 9 th data bit is " 0 ". In mode 1 , if UARTCON. $5=$ " 1 " then the receive interrut will not be activated if a valid stop bit was not received. In mode 0, the UARTCON. 5 bit should be " 0 "
2. The descriptions for 8-bit and 9-bit UART mode do not include start and stop bits for serial data receive and transmit.
3. The interrupt pending bits of Rx and Tx are in the INTPND register.

Figure 17-1. UART Control Register (UARTCON)

## UART INTERRUPT PENDING BITS

The UART interrupt pending bits, INTPND.5-.4, are located in set 1, bank 0 at address F9H, it contains the UART data transmit interrupt pending bit (INTPND.4) and the receive interrupt pending bit (INTPND.5).

In mode 0, the receive interrupt pending bit INTPND. 5 is set to " 1 " when the 8th receive data bit has been shifted. In mode 1, the INTPND. 5 bit is set to "1" at the halfway point of the stop bit's shift time. In mode 2 , or 3 , the INTPND. 5 bit is set to " 1 " at the halfway point of the RB8 bit's shift time. When the CPU has acknowledged the receive interrupt pending condition, the INTPND. 5 bit must then be cleared by software in the interrupt service routine.

In mode 0, the transmit interrupt pending bit INTPND. 4 is set to " 1 " when the 8 th transmit data bit has been shifted. In mode 1, 2, or 3 , the INTPND. 4 bit is set at the start of the stop bit. When the CPU has acknowledged the transmit interrupt pending condition, the INTPND. 4 bit must then be cleared by software in the interrupt service routine.

Figure 17-2. UART Interrupt Pending Bits (INTPND.5-.4)

## UART DATA REGISTER (UDATA)

Figure 17-3. UART Data Register (UDATA)

## UART BAUD RATE DATA REGISTER (BRDATA)

The value stored in the UART baud rate register, BRDATA, lets you determine the UART clock rate (baud rate).
$\square$
Figure 17-4. UART Baud Rate Data Register (BRDATA)

## BAUD RATE CALCULATIONS

## Mode 0 Baud Rate Calculation

In mode 0 , the baud rate is determined by the UART baud rate data register, BRDATA in set 1 , bank 0 at address F 8 H : Mode 0 baud rate $=\mathrm{fxx} /(16 \times($ BRDATA +1$))$.

## Mode 2 Baud Rate Calculation

The baud rate in mode 2 is fixed at the $\mathrm{f}_{\mathrm{OSc}}$ clock frequency divided by 16 : Mode 2 baud rate $=\mathrm{fxx} / 16$

## Modes 1 and 3 Baud Rate Calculation

In modes 1 and 3 , the baud rate is determined by the UART baud rate data register, BRDATA in set 1 , bank 0 at address F8H: Mode 1 and 3 baud rate $=\mathrm{fxx} /(16 \times($ BRDATA +1$))$

Table 17-1. Commonly Used Baud Rates Generated by BRDATA

| Mode | Baud Rate | Oscillation Clock | BRDATA |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Decimal | Hexadecimal |
| Mode 2 | 0.5 MHz | 8 MHz | X | X |
|  | 230,400 Hz | 11.0592 MHz | 02 | 02H |
|  | $115,200 \mathrm{~Hz}$ | 11.0592 MHz | 05 | 05H |
|  | $57,600 \mathrm{~Hz}$ | 11.0592 MHz | 11 | OBH |
|  | $38,400 \mathrm{~Hz}$ | 11.0592 MHz | 17 | 11H |
|  | 19,200 Hz | 11.0592 MHz | 35 | 23H |
|  | 9,600 Hz | 11.0592 MHz | 71 | 47H |
|  | $4,800 \mathrm{~Hz}$ | 11.0592 MHz | 143 | 8FH |
|  | 62,500 Hz | 10 MHz | 09 | 09H |
|  | 9,615 Hz | 10 MHz | 64 | 40 H |
|  | $38,461 \mathrm{~Hz}$ | 8 MHz | 12 | 0 CH |
|  | $12,500 \mathrm{~Hz}$ | 8 MHz | 39 | 27H |
|  | 19,230 Hz | 4 MHz | 12 | 0CH |
|  | 9,615 Hz | 4 MHz | 25 | 19H |

## BLOCK DIAGRAM

Figure 17-5. UART Functional Block Diagram

## UART MODE 0 FUNCTION DESCRIPTION

In mode 0 , UART is input and output through the RxD (P3.5) pin and TxD (P3.4) pin outputs the shift clock. Data is transmitted or received in 8-bit units only. The LSB of the 8-bit value is transmitted (or received) first.

## Mode 0 Transmit Procedure

1. Select mode 0 by setting UARTCON. 6 and .7 to "OOB".
2. Write transmission data to the shift register UDATA (F7H, set 1, bank 0 ) to start the transmission operation.

## Mode 0 Receive Procedure

1. Select mode 0 by setting UARTCON. 6 and .7 to "00B".
2. Clear the receive interrupt pending bit (INTPND.5) by writing a "0" to INTPND.5.
3. Set the UART receive enable bit (UARTCON.4) to "1".
4. The shift clock will now be output to the TxD (P3.4) pin and will read the data at the RxD (P3.5) pin. A UART receive interrupt (IRQ5, vector ECH) occurs when UARTCON. 1 is set to " 1 ".

Figure 17-6. Timing Diagram for Serial Port Mode 0 Operation

## SERIAL PORT MODE 1 FUNCTION DESCRIPTION

In mode 1, 10-bits are transmitted (through the TxD (P3.4) pin) or received (through the RxD (P3.5) pin). Each data frame has three components:
— Start bit ("0")

- 8 data bits (LSB first)
— Stop bit ("1")

The baud rate for mode 1 is variable.

## Mode 1 Transmit Procedure

1. Select the baud rate generated by BRDATA.
2. Select mode 1 (8-bit UART) by setting UARTCON bits 7 and 6 to '01B'.
3. Write transmission data to the shift register UDATA (F7H, set 1 , bank 0 ). The start and stop bits are generated automatically by hardware.

## Mode 1 Receive Procedure

1. Select the baud rate to be generated by BRDATA.
2. Select mode 1 and set the RE (Receive Enable) bit in the UARTCON register to "1".
3. The start bit low ("0") condition at the RxD (P3.5) pin will cause the UART module to start the serial data receive operation.

Figure 17-7. Timing Diagram for Serial Port Mode 1 Operation

## SERIAL PORT MODE 2 FUNCTION DESCRIPTION

In mode 2, 11-bits are transmitted (through the TxD (P3.4) pin) or received (through the RxD (P3.5) pin). Each data frame has four components:
— Start bit ("0")

- 8 data bits (LSB first)
- Programmable 9th data bit
— Stop bit ("1")

The 9th data bit to be transmitted can be assigned a value of "0" or "1" by writing the TB8 bit (UARTCON.3). When receiving, the 9th data bit that is received is written to the RB8 bit (UARTCON.2), while the stop bit is ignored. The baud rate for mode 2 is fosc/16 clock frequency.

## Mode 2 Transmit Procedure

1. Select mode 2 (9-bit UART) by setting UARTCON bits 6 and 7 to ' $10 B^{\prime}$ '. Also, select the 9 th data bit to be transmitted by writing TB8 to "0" or "1".
2. Write transmission data to the shift register, UDATA (F7H, set 1, bank 0), to start the transmit operation.

## Mode 2 Receive Procedure

1. Select mode 2 and set the receive enable bit (RE) in the UARTCON register to "1".
2. The receive operation starts when the signal at the RxD (P3.5) pin goes to low level.

Figure 17-8. Timing Diagram for Serial Port Mode 2 Operation

## SERIAL PORT MODE 3 FUNCTION DESCRIPTION

In mode 3, 11-bits are transmitted (through the TxD (P3.4) pin) or received (through the RxD (P3.5) pin). Mode 3 is identical to mode 2 except for baud rate, which is variable. Each data frame has four components:
— Start bit ("0")

- 8 data bits (LSB first)
- Programmable 9th data bit
— Stop bit ("1")

## Mode 3 Transmit Procedure

1. Select the baud rate generated by BRDATA.
2. Select mode 3 operation (9-bit UART) by setting UARTCON bits 6 and 7 to ' $11 \mathrm{~B}^{\prime}$ '. Also, select the 9 th data bit to be transmitted by writing UARTCON. 3 (TB8) to "0" or "1".
3. Write transmission data to the shift register, UDATA (F7H, set 1 , bank 0 ), to start the transmit operation.

## Mode 3 Receive Procedure

1. Select the baud rate to be generated by BRDATA.
2. Select mode 3 and set the RE (Receive Enable) bit in the UARTCON register to " 1 ".
3. The receive operation will be started when the signal at the RxD (P3.5) pin goes to low level.

Figure 17-9. Timing Diagram for Serial Port Mode 3 Operation

## SERIAL COMMUNICATION FOR MULTIPROCESSOR CONFIGURATIONS

The S3C8-series multiprocessor communication features lets a "master" S3C828B/F828B/C8289/F8289/C8285/ F8285 send a multiple-frame serial message to a "slave" device in a multi- S3C828B/F828B/C8289/F8289/C8285 /F8285 configuration. It does this without interrupting other slave devices that may be on the same serial line.

This feature can be used only in UART modes 2 or 3 . In these modes 2 and 3, 9 data bits are received. The 9th bit value is written to RB8 (UARTCON.2). The data receive operation is concluded with a stop bit. You can program this function so that when the stop bit is received, the serial interrupt will be generated only if RB8 = " 1 ".

To enable this feature, you set the MCE bit in the UARTCON register. When the MCE bit is "1", serial data frames that are received with the 9 th bit $=$ " 0 " do not generate an interrupt. In this case, the 9 th bit simply separates the address from the serial data.

## Sample Protocol for Master/Slave Interaction

When the master device wants to transmit a block of data to one of several slaves on a serial line, it first sends out an address byte to identify the target slave. Note that in this case, an address byte differs from a data byte: In an address byte, the 9 th bit is " 1 " and in a data byte, it is " 0 ".

The address byte interrupts all slaves so that each slave can examine the received byte and see if it is being addressed. The addressed slave then clears its MCE bit and prepares to receive incoming data bytes.

The MCE bits of slaves that were not addressed remain set, and they continue operating normally while ignoring the incoming data bytes.

While the MCE bit setting has no effect in mode 0 , it can be used in mode 1 to check the validity of the stop bit. For mode 1 reception, if MCE is " 1 ", the receive interrupt will be issue unless a valid stop bit is received.

## Setup Procedure for Multiprocessor Communications

Follow these steps to configure multiprocessor communications:

1. Set all S3C828B/F828B/C8289/F8289/C8285/F8285 devices (masters and slaves) to UART mode 2 or 3.
2. Write the MCE bit of all the slave devices to "1".
3. The master device's transmission protocol is:

- First byte: the address identifying the target slave device (9th bit = "1")
- Next bytes: data (9th bit = "0")

4. When the target slave receives the first byte, all of the slaves are interrupted because the 9 th data bit is "1". The targeted slave compares the address byte to its own address and then clears its MCE bit in order to receive incoming data. The other slaves continue operating normally.

Full-Duplex Multi-S3C828B/F828B/C8289/F8289/C8285/F8285 Interconnect

Figure 17-10. Connection Example for Multiprocessor Serial Data Communications

## BATTERY LEVEL DETECTOR

## OVERVIEW

The S3C828B/F828B/C8289/F8289/C8285/F8285 micro-controller has a built-in BLD (Battery Level Detector) circuit which allows detection of power voltage drop or external input level through software. Turning the BLD operation on and off can be controlled by software. Because the IC consumes a large amount of current during BLD operation. It is recommended that the BLD operation should be kept OFF unless it is necessary. Also the BLD criteria voltage can be set by the software. The criteria voltage can be set by matching to one of the 3 kinds of voltage below that can be used.
2.2 $\mathrm{V}, 2.4 \mathrm{~V}$ or $2.8 \mathrm{~V}\left(\mathrm{~V}_{\mathrm{DD}}\right.$ reference voltage), or external input level (External reference voltage)

The $\mathrm{B}_{\mathrm{LD}}$ block works only when BLDCON. 3 is set. If $\mathrm{V}_{\mathrm{DD}}$ level is lower than the reference voltage selected with BLDCON.2-.0, BLDCON. 4 will be set. If $V_{D D}$ level is higher, BLDCON. 4 will be cleared. When users need to minimize current consumption, do not operate the BLD block.

Figure 18-1. Block Diagram for Battery Level Detect

## BATTERY LEVEL DETECTOR CONTROL REGISTER (BLDCON)

The bit 3 of BLDCON controls to run or disable the operation of Battery level detect. Basically this $\mathrm{V}_{\mathrm{BLD}}$ is set as 2.2 V by system reset and it can be changed in 3 kinds voltages by selecting Battery Level Detect Control register (BLDCON). When you write 3 bit data value to BLDCON, an established resistor string is selected and the $V_{B L D}$ is fixed in accordance with this resistor. Figure $18-2$ shows specific $V_{B L D}$ of 3 levels.

Figure 18-2. Battery Level Detector Control Register (BLDCON)

NOTES:

1. The reset value of BLDCON is $\# 00 \mathrm{H}$.
2. VREF is about 1 V .

Figure 18-3. Battery Level Detector Circuit and Block Diagram

## 19

## EMBEDDED FLASH MEMEORY INTERFACE

## OVERVIEW

This chapter is only for the S3F828B. The S3F828B has an on-chip flash memory internally instead of masked ROM. The flash memory is accessed by 'LDC' instruction and the type of sector erase and a byte programmable flash, a user can program the data in a flash memory area any time you want. The S3F828B's embedded 64Kbyte memory has two operating features:

- User Program Mode: S3F828B Only
- Tool Program Mode: Refer to the chapter 22. S3F828B/F8289/F8285 FLASH MCU.

## USER PROGRAM MODE

This mode supports sector erase, byte programming, byte read and one protection mode (Hard lock protection). The read protection mode is available only in Tool Program mode. So in order to make a chip into read protection, you need to select a read protection option when you program a initial your code to a chip by using Tool Program mode by using a programming tool.

The S3F828B has the pumping circuit internally, therefore, 12.5 V into $\mathrm{V}_{\mathrm{PP}}$ (Test) pin is not needed. To program a flash memory in this mode several control registers will be used. There are four kind functions - programming, reading, sector erase, hard lock protection

## FLASH MEMORY CONTROL REGISTERS (USER PROGRAM MODE)

## Flash Memory Control Register

FMCON register is available only in user program mode to select the Flash Memory operation mode; sector erase, byte programming, and to make the flash memory into a hard lock protection.

Figure 19-1. Flash Memory Control Register (FMCON)

The bitO of FMCON register (FMCON.0) is a start bit for Erase and Hard Lock operation mode. Therefore, operation of Erase and Hard Lock mode is activated when you set FMCON. 0 to "1". Also you should wait a time of Erase (Sector erase) or Hard lock to complete it's operation before a byte programming or a byte read of same sector area by using "LDC" instruction. When you read or program a byte data from or into flash memory, this bit is not needed to manipulate.

The sector erase status bit is read only. If an interrupt is requested during the operation of "Sector erase", the operation of "Sector erase" is discontinued, and the interrupt is served by CPU. Therefore, the sector erase status bit should be checked after executing "Sector erase". The "sector erase" operation is success if the bit is logic "0", and is failure if the bit is logic " 1 ".

NOTE: When the ID code, "A5H", is written to the FMUSR register. A mode of sector erase, user program, and hard lock may be executed unfortunately. So, it should be careful of the above situation.

## Flash Memory User Programming Enable Register

The FMUSR register is used for a safety operation of the flash memory. This register will protect undesired erase or program operation from malfunctioning of CPU caused by an electrical noise.

After reset, the user-programming mode is disabled, because the value of FMUSR is "00000000B" by reset operation. If necessary to operate the flash memory, you can use the user programming mode by setting the value of FMUSR to "10100101B". The other value of "10100101b", User Program mode is disabled.

Figure 19-2. Flash Memory User Programming Enable Register (FMUSR)

## Flash Memory Sector Address Registers

There are two sector address registers for addressing a sector to be erased. The FMSECL (Flash Memory Sector Address Register Low Byte) indicates the low byte of sector address and FMSECH (Flash Memory Sector Address Register High Byte) indicates the high byte of sector address.

The FMSECH is needed for S3F828B because it has 512 sectors, respectively. One sector consists of 128-bytes. Each sector's address starts $\mathrm{XX00H}$ or $\mathrm{XX80H}$ that is a base address of sector is $\mathrm{XX00H}$ or $\mathrm{XX80H}$. So FMSECL register 6-0 don't mean whether the value is ' 1 ' or ' 0 '. We recommend that the simplest way is to load sector base address into FMSECH and FMSECL register.

When programming the flash memory, you should write data after loading sector base address located in the target address to write data into FMSECH and FMSECL register. If the next operation is also to write data, you should check whether next address is located in the same sector or not. In case of other sectors, you must load sector address to FMSECH and FMSECL register according to the sector.

Figure 19-3. Flash Memory Sector Address Register High Byte (FMSECH)

Figure 19-4. Flash Memory Sector Address Register Low Byte (FMSECL)

## ISPTM (ON-BOARD PROGRAMMING) SECTOR

ISP ${ }^{\text {TM }}$ sectors located in program memory area can store On Board Program software (Boot program code for upgrading application code by interfacing with I/O port pin). The ISP ${ }^{T M}$ sectors can not be erased or programmed by LDC instruction for the safety of On Board Program software.

The ISP sectors are available only when the ISP enable/disable bit is set 0 , that is, enable ISP at the Smart Option. If you don't like to use ISP sector, this area can be used as a normal program memory (can be erased or programmed by LDC instruction) by setting ISP disable bit ("1") at the Smart Option. Even if ISP sector is selected, ISP sector can be erased or programmed in the Tool Program mode, by Serial programming tools.

The size of ISP sector can be varied by settings of Smart Option. You can choose appropriate ISP sector size according to the size of On Board Program software.

Figure 19-5. Program Memory Address Space

Table 19-2. ISP Sector Size

| Smart Option(003CH) ISP Size Selection Bit |  |  | Area of ISP Sector | ISP Sector Size |
| :---: | :---: | :---: | :---: | :---: |
| Bit 2 | Bit 1 | Bit 0 |  |  |
| 1 | x | x | - | 0 |
| 0 | 0 | 0 | $100 \mathrm{H}-1 F F H$ ( 256 Byte $)$ | 256 Bytes |
| 0 | 0 | 1 | $100 \mathrm{H}-2 F F H$ ( 512 Byte) | 512 Bytes |
| 0 | 1 | 0 | $100 \mathrm{H}-4 F F H$ (1024 Byte) | 1024 Bytes |
| 0 | 1 | 1 | $100 \mathrm{H}-8 F F H$ (2048 Byte) | 2048 Bytes |

NOTE: The area of the ISP sector selected by Smart Option bit (003CH. 2 - 003CH.0) can not be erased and programmed by LDC instruction in User Program mode.

## ISP RESET VECTOR AND ISP SECTOR SIZE

If you use ISP sectors by setting the ISP Enable/Disable bit to "0" and the Reset Vector Selection bit to "0" at the Smart Option, you can choose the reset vector address of CPU as shown in Table 19-3 by setting the ISP Reset Vector Address Selection bits.

Table 19-3. Reset Vector Address

| Smart Option (003CH) <br> ISP Reset Vector Address Selection Bit |  |  | Reset Vector <br> Address After POR | Usable Area for <br> ISP Sector | ISP Sector Size |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 6 | Bit 5 |  |  |  |
| 1 | $x$ | $x$ | 0100 H | - | - |
| 0 | 0 | 0 | 0200 H | $100 \mathrm{H}-1 \mathrm{FFH}$ | 256 Bytes |
| 0 | 0 | 1 | 0300 H | $100 \mathrm{H}-2 \mathrm{FFH}$ | 512 Bytes |
| 0 | 1 | 0 | 0500 H | $100 \mathrm{H}-4 \mathrm{FFH}$ | 1024 Bytes |
| 0 | 1 | 1 | 0900 H | $100 \mathrm{H}-8 \mathrm{FFH}$ | 2048 Bytes |

NOTE: The selection of the ISP reset vector address by Smart Option (003CH. 7 - 003CH.5) is not dependent of the selection of ISP sector size by Smart Option (003CH. 2 - 003CH.0).

## SECTOR ERASE

User can erase a flash memory partially by using sector erase function only in User Program Mode. The only unit of flash memory to be erased and programmed in User Program Mode is called sector.

The program memory of S3F828B is divided into 512 sectors for unit of erase and programming, respectively. Every sector has all 128-byte sizes of program memory areas. So each sector should be erased first to program a new data (byte) into a sector.

Minimum 10ms delay time for erase is required after setting sector address and triggering erase start bit (FMCON.0). Sector Erase is not supported in Tool Program Modes (MDS mode tool or Programming tool).

Figure 19-6. Sector Configurations in User Program Mode

## The Sector ERASE program procedure in User program Mode

1. Set Flash Memory User Programming Enable Register (FMUSR) to "10100101B".
2. Set Flash Memory Sector Address Register (FMSECH/ FMSECL).
3. Set Flash Memory Control Register (FMCON) to "10100001B".
4. Set Flash Memory User Programming Enable Register (FMUSR) to "00000000B".
5. Check the "Sector erase status bit" whether "Sector erase" is success or not.

## PROGRAMMING TIP - Sector Erase

|  | $\bullet$ |  |  |
| :--- | :--- | :--- | :--- |
| reErase: | SB1 |  |  |
|  | LD | FMUSR,\#0A5H | ; User Program mode enable |
|  | LD | FMSECH,\#10H |  |
|  | LD | FMSECL,\#00H | ; Set sector address (1000H-107FH) |
|  | LD | FMCON,\#10100001B | ; Start sector erase |
|  | NOP |  | ; Dummy Instruction, This instruction must be needed |
|  | NOP |  | Dummy Instruction, This instruction must be needed |
|  | LD | FMUSR,\#0 | User Program mode disable |

## PROGRAMMING

A flash memory is programmed in one byte unit after sector erase. And for programming safety's sake, must set FMSECH and FMSECL to flash memory sector value.

The write operation of programming starts by 'LDC' instruction.
You can write until 128byte, because this flash sector's limits is 128byte.
So if you written 128byte, must reset FMSECH and FMSECL.

## The program procedure in User program Mode

1. Must erase sector before programming.
2. Set Flash Memory User Programming Enable Register (FMUSR) to "10100101B".
3. Set Flash Memory Control Register (FMCON) to "01010000B".
4. Set Flash Memory Sector Register (FMSECH, FMSECL) to sector value of write address.
5. Load a transmission data into a working register.
6. Load a flash memory upper address into upper register of pair working register.
7. Load a flash memory lower address into lower register of pair working register.
8. Load transmission data to flash memory location area on 'LDC' instruction by indirectly addressing mode
9. Set Flash Memory User Programming Enable Register (FMUSR) to "00000000B".

## PROGRAMMING TIP — Program

## HARD LOCK PROTECTION

User can set Hard Lock Protection by write '0110' in FMCON7-4. If this function is enabled, the user cannot write or erase the data in a flash memory area. This protection can be released by the chip erase execution (in the tool program mode).

In terms of user program mode, the procedure of setting Hard Lock Protection is following that. Whereas in tool mode the manufacturer of serial tool writer could support Hardware Protection. Please refer to the manual of serial program writer tool provided by the manufacturer.

The program procedure in User program Mode

1. Set Flash Memory User Programming Enable Register (FMUSR) to "10100101B".
2. Set Flash Memory Control Register (FMCON) to "01100001B".
3. Set Flash Memory User Programming Enable Register (FMUSR) to "00000000B".

## PROGRAMMING TIP — Hard Lock Protection

## 20

## ELECTRICAL DATA

## OVERVIEW

In this chapter, S3C828B/F828B/C8289/F8289/C8285/F8285 electrical characteristics are presented in tables and graphs. The information is arranged in the following order:

- Absolute maximum ratings
- Input/output capacitance
- D.C. electrical characteristics
- A.C. electrical characteristics
- Oscillation characteristics
- Oscillation stabilization time
- Data retention supply voltage in stop mode
- LVR timing characteristics
- BLD electrical characteristics
- Serial I/O timing characteristics
- A/D converter electrical characteristics
- UART timing characteristics
- Internal Flash ROM electrical characteristics
- Operating voltage range

Table 20-1. Absolute Maximum Ratings
$\left(\mathrm{T}_{\mathrm{A}}=25{ }^{\circ} \mathrm{C}\right)$

| Parameter | Symbol | Conditions | Rating | Unit |

## NOTES:

1. It is middle output voltage when the $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{LC} 0}$ pin are connected.
2. Supply current does not include current drawn through internal pull-up resistors, LCD voltage dividing resistors, the LVR block, and external output current loads.
3. $\mathrm{I}_{\mathrm{DD} 1}$ and $\mathrm{I}_{\mathrm{DD} 2}$ include a power consumption of subsystem oscillator.
4. $\mathrm{I}_{\mathrm{DD} 3}$ and $\mathrm{I}_{\mathrm{DD} 4}$ are the current when the main system clock oscillation stop and the subsystem clock is used.
(OSCCON.7 = 1)
5. IDD5 is the current when the main and subsystem clock oscillation stops.
6. Every values in this table is measured when bits $4-3$ of the system clock control register (CLKCON.4-.3) is set to 11 B .

| Number of Writing/Erasing | $\mathrm{FN}_{\text {WE }}$ | - | - | - | 10,000 ${ }^{(4)}$ | Times |

NOTES:

1. The Programming time is the time during which one byte (8-bit) is programmed.
2. The Chip Erasing time is the time during which all 64 K byte block is erased.
3. The Sector Erasing time is the time during which all 128 byte block is erased.
4. Maximum number of Writing/Erasing is 10,000 times for full-flash (S3F828B) and 100 times for half flash (S3F8289/F8285).
5. The Chip Erasing is available in Tool Program Mode only.

## MECHANICAL DATA

## OVERVIEW

The S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller is currently available in 80-pin-QFP/TQFP package.

Figure 21-1. Package Dimensions (80-QFP-1420C)

Figure 21-2. Package Dimensions (80-TQFP-1212)

## S3F828B/F8289/F8285 FLASH MCU

## OVERVIEW

The S3F828B/F8289/F8285 single-chip CMOS microcontroller is the Flash MCU version of the S3C828B/C8289/C8285 microcontroller. It has an on-chip Flash MCU ROM instead of a masked ROM. The Flash ROM is accessed by serial data format.

The S3F828B/F8289/F8285 is fully compatible with the S3C828B/C8289/C8285, both in function and in pin configuration. Because of its simple programming requirements, the S3F828B/F8289/F8285 is ideal as an evaluation chip for the S3C828B/C8289/C8285.

## NOTE

This chapter is about the Tool Program Mode of Flash MCU. If you want to know the User Program Mode, refer to the chapter 19. Embedded Flash Memory Interface.

Figure 22-1. S3F828B/F8289/F8285 Pin Assignments (80-QFP-1420C)

Figure 22-2. S3F828B/F8289/F8285 Pin Assignments (80-TQFP-1212)

Table 22-1. Descriptions of Pins Used to Read/Write the Flash ROM

| Main Chip <br> Pin Name | During Programming |  |  |  |
| :---: | :---: | :---: | :---: | :--- |
|  | Pin Name | Pin No. | I/O | Function |
| P3.4 | SDAT | $10(8)$ | I/O | Serial data pin. Output port when reading and <br> input port when writing. Can be assigned as a <br> Input/push-pull output port. |
| TEST | SCLK | $11(9)$ | I/O | Serial clock pin. Input only pin. |
| nRESET | VRP | $16(14)$ | I | Power supply pin for Flash ROM cell writing <br> (indicates that FLASH MCU enters into the <br> writing mode). When 12.5 V is applied, FLASH <br> MCU is in writing mode and when 3.3 V is <br> applied, FLASH MCU is in reading mode. |
| $\mathrm{V}_{\text {DD }}, \mathrm{V}_{\text {SS }}$ | $\mathrm{V}_{\text {DD }}, \mathrm{V}_{\text {SS }}$ | 12(10) <br> $13(11)$ | - | Power supply pin for logic circuit. VDD should be <br> tied to +3.3V during programming. |

## NOTES:

1. Parentheses indicate pin number for 80-TQFP-1212 package.
2. The $\mathrm{V}_{\mathrm{PP}}$ (Test) pin had better connect to $\mathrm{V}_{\mathrm{DD}}$ (S3F828B only).

Table 22-2. Comparison of S3F828B/F8289/F8285 and S3C828B/C8289/C8285 Features

| Characteristic | S3F828B/9/5 | S3C828B/9/5 |
| :--- | :--- | :--- |
| Program memory | $64 \mathrm{~K} / 32 \mathrm{~K} / 16 \mathrm{~K}$-byte Flash ROM | $64 \mathrm{~K} / 32 \mathrm{~K} / 16 \mathrm{~K}$-byte mask ROM |
| Operating voltage $\left(\mathrm{V}_{\mathrm{DD}}\right)$ | 2.0 V to 3.6 V | 2.0 V to 3.6 V |
| Flash MCU programming mode | $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{PP}}(\mathrm{TEST})=12.5 \mathrm{~V}$ |  |
| Programmability | User program multi time | Programmed at the factory |

## OPERATING MODE CHARACTERISTICS

When 12.5 V is supplied to the $\mathrm{V}_{\mathrm{PP}}$ (TEST) pin of the $\mathrm{S} 3 \mathrm{C} 828 \mathrm{~B} / \mathrm{C} 8289 / \mathrm{C} 8285$, the Flash ROM programming mode is entered. The operating mode (read, write, or read protection) is selected according to the input signals to the pins listed in Table 22-3 below.

Table 22-3. Operating Mode Selection Criteria

| $\mathbf{V}_{\mathbf{D D}}$ | $\mathbf{V}_{\mathbf{P P}}$ (TEST) | REG/nMEM | Address <br> (A15-A0) | R/W | Mode |
| :---: | :---: | :---: | :---: | :---: | :--- |
| }{} | 3.3 V | 0 | 0000 H | 1 | Flash ROM read |
|  | 12.5 V | 0 | 0000 H | 0 | Flash ROM program |
|  | 12.5 V | 0 | 0000 H | 1 | Flash ROM verify |
|  | 12.5 V | 1 | $0 E 3 F H$ | 0 | Flash ROM read protection |

## NOTES:

1. The $\mathrm{V}_{\mathrm{PP}}$ (Test) pin had better connect to $\mathrm{V}_{\mathrm{DD}}$ (S3F828B only).
2. "0" means Low level; "1" means High level.

## NOTES:

1. Supply current does not include current drawn through internal pull-up resistors, LCD voltage dividing resistors, the LVR block, and external output current loads.
2. $\mathrm{I}_{\mathrm{DD} 1}$ and $\mathrm{I}_{\mathrm{DD} 2}$ include a power consumption of subsystem oscillator.
3. $\mathrm{I}_{\mathrm{DD} 3}$ and $\mathrm{I}_{\mathrm{DD} 4}$ are the current when the main system clock oscillation stops and the subsystem clock is used.
(OSCCON.7=1)
4. $\mathrm{I}_{\mathrm{DD5}}$ is the current when the main and subsystem clock oscillation stops.
5. Every values in this table is measured when bits $4-3$ of the system clock control register (CLKCON.4-.3) is set to 11B.

## DEVELOPMENT TOOLS

## OVERVIEW

Samsung provides a powerful and easy-to-use development support system in turnkey form. The development support system is configured with a host system, debugging tools, and support software. For the host system, any standard computer that operates with MS-DOS, Windows 95 , and 98 as its operating system can be used. One type of debugging tool including hardware and software is provided: the sophisticated and powerful in-circuit emulator, SMDS2+, and OPENice for S3C7, S3C9, S3C8 families of microcontrollers. The SMDS2+ is a new and improved version of SMDS2. Samsung also offers support software that includes debugger, assembler, and a program for setting options.

## SHINE

Samsung Host Interface for In-Circuit Emulator, SHINE, is a multi-window based debugger for SMDS2+. SHINE provides pull-down and pop-up menus, mouse support, function/hot keys, and context-sensitive hyper-linked help. It has an advanced, multiple-windowed user interface that emphasizes ease of use. Each window can be sized, moved, scrolled, highlighted, added, or removed completely.

## SAMA ASSEMBLER

The Samsung Arrangeable Microcontroller (SAM) Assembler, SAMA, is a universal assembler, and generates object code in standard hexadecimal format. Assembled program code includes the object code that is used for ROM data and required SMDS program control data. To assemble programs, SAMA requires a source file and an auxiliary definition (DEF) file with device specific information.

## SASM88

The SASM88 is a relocatable assembler for Samsung's S3C8-series microcontrollers. The SASM88 takes a source file containing assembly language statements and translates into a corresponding source code, object code and comments. The SASM88 supports macros and conditional assembly. It runs on the MS-DOS operating system. It produces the relocatable object code only, so the user should link object file. Object files can be linked with other object files and loaded into memory.

## HEX2ROM

HEX2ROM file generates ROM code from HEX file which has been produced by assembler. ROM code must be needed to fabricate a microcontroller which has a mask ROM. When generating the ROM code (.OBJ file) by HEX2ROM, the value "FF" is filled into the unused ROM area up to the maximum ROM size of the target device automatically.

## TARGET BOARDS

Target boards are available for all S3C8-series microcontrollers. All required target system cables and adapters are included with the device-specific target board.

Figure 23-1. SMDS Product Configuration (SMDS2+)

## TB828B/9/5 TARGET BOARD

The TB828B/9/5 target board is used for the S3C828B/F828B/C8289/F8289/C8285/F8285 microcontroller. It is supported with the SMDS2+.

Figure 23-2. TB828B/9/5 Target Board Configuration

Table 23-1. Power Selection Settings for TB828B/9/5

| "To User_Vcc" Settings | Operating Mode | Comments |
| :---: | :---: | :---: |
|  |  | The SMDS2/SMDS2+ supplies $\mathrm{V}_{\mathrm{CC}}$ to the target board (evaluation chip) and the target system. |
|  |  | The SMDS2/SMDS2+ supplies $\mathrm{V}_{\mathrm{CC}}$ only to the target board (evaluation chip). The target system must have its own power supply. |

NOTE: The following symbol in the "To User_Vcc" Setting column indicates the electrical short (off) configuration:

Table 23-2. Main-clock Selection Settings for TB828B/9/5

| Main Clock Settings | Operating Mode | Comments |
| :---: | :---: | :---: |
|  |  | Set the XI switch to "MDS" when the target board is connected to the SMDS2/SMDS2+. |
|  |  | Set the XI switch to "XTAL" when the target board is used as a standalone unit, and is not connected to the SMDS2/SMDS2+. |

Table 23-3. Device Selection Settings for TB828B/9/5

## SMDS2+ SELECTION (SAM8)

In order to write data into program memory that is available in SMDS2+, the target board should be selected to be for SMDS2+ through a switch as follows. Otherwise, the program memory writing function is not available.

Table 23-4. The SMDS2+ Tool Selection Setting

## IDLE LED

The Yellow LED is ON when the evaluation chip (S3E8280) is in idle mode.

## STOP LED

The Red LED is ON when the evaluation chip (S3E8280) is in stop mode.

Table 23-5. Smart Option Source Settings for TB828B/9/5

Table 23-6. Smart Option Switch Setting for TB828B/9/5

| "Smart Option" Setting | Comments |
| :---: | :---: |
|  | The Smart Option can be selected by this switch when the Smart Option source is selected by external. The SW1.3-SW1.1 are comparable to the 003EH.2-.0. The SW1.8-SW1.6 are comparable to the 003EH.7-.5. The SW1.9 is comparable to the 003FH.0. The SW1.5-1.4 is not connected. The SW1.10 is not used. |
