## FEATURES

12/16-Bit Resolution and Monotonicity
Current Output Ranges: $\mathbf{4 - 2 0 m A}, \mathbf{0 - 2 0 m A}$ or $0-24 m A$
$0.1 \%$ typ Total Unadjusted Error (TUE)
5ppm/ ${ }^{\circ} \mathrm{C}$ Output Drift
Flexible Serial Digital Interface
On-Chip Output Fault Detection
On-Chip Reference ( $10 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ Max)
Asynchronous CLEAR Function
Power Supply (AVDD) Range
10.8 V to 60 V ; AD5410/AD5420ACPZ
10.8V to 40V; AD5410/AD5420AREZ

Output Loop Compliance to AV $\mathbf{D D}-2.5 \mathrm{~V}$
Temperature Range: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
TSSOP and LFCSP Packages

## APPLICATIONS

## Process Control

Actuator Control
PLC

## GENERAL DESCRIPTION

The AD5410/AD5420 is a low-cost, precision, fully integrated 12/16-bit converter offering a programmable current source output designed to meet the requirements of industrial process control applications. The output current range is programmable to 4 mA to $20 \mathrm{~mA}, 0 \mathrm{~mA}$ to 20 mA or an over range function of 0 mA to 24 mA . The output is open circuit protected and can drive inductive loads of 1 H . The device is specified to operate with a power supply range from 10.8 V to 40 V AD5410/AD5420AREZ) or 10.8 V to 60 V (AD5410/AD5420ACPZ). Output loop compliance is 0 V to $A V_{D D}-2.5 \mathrm{~V}$.
The flexible serial interface is SPI and MICROWIRE compatible and can be operated in 3-wire mode to minimize the digital isolation required in isolated applications.
The device also includes a power-on-reset function ensuring that the device powers up in a known state and an asynchronous CLEAR pin which sets the output to the low end of the selected current range.
The total output error is typically $\pm 0.1 \%$ FSR.

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ unless otherwise noted.
Transient currents of up to 100 mA do not cause SCR latch-up.
Table 5.

| Parameter | Rating |
| :---: | :---: |
| AV ${ }_{\text {DD }}$ to AGND, DGND | -0.3 V to 60V |
| DVcc to AGND, DGND | -0.3 V to +7V |
| Digital Inputs to AGND, DGND | $\begin{aligned} & -0.3 \mathrm{~V} \text { to } \mathrm{DV}_{\mathrm{cc}}+0.3 \mathrm{~V} \text { or } 7 \mathrm{~V} \\ & \text { (whichever is less) } \end{aligned}$ |
| Digital Outputs to AGND, DGND | -0.3 V to DV cc +0.3 V or 7 V (whichever is less) |
| REFIN/REFOUT to AGND, DGND | -0.3 V to +7 V |
| lout to AGND, DGND | -0.3 V to $\mathrm{AV} \mathrm{VD}^{\text {d }}$ |
| AGND to DGND | -0.3 V to +0.3 V |
| Operating Temperature Range Industrial | $-40^{\circ} \mathrm{C}$ to $+85^{10} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Junction Temperature (T, max) | $125^{\circ} \mathrm{C}$ |
| 24-Lead TSSOP Package $\theta_{\mathrm{JA}}$ Thermal Impedance | $42^{\circ} \mathrm{C} / \mathrm{W}$ |
| 40-Lead LFCSP Package $\theta_{\mathrm{JA}}$ Thermal Impedance | $28^{\circ} \mathrm{C} / \mathrm{W}$ |
| Power Dissipation | ( $\mathrm{T}, \mathrm{max}^{\text {m }} \mathrm{T}_{\mathrm{A}}$ ) $/ \theta_{\text {JA }}$ |
| Lead Temperature <br> Soldering | JEDEC Industry Standard J-STD-020 |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |
| :--- | :--- |

[^3]
## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 5. TSSOP Pin Configuration

Figure 6. LFCSP Pin Configuration

Table 6. Pin Function Descriptions

| TSSOP Pin No. | LFCSP Pin No. | Mnemonic | Description |
| :---: | :---: | :---: | :---: |
| 1,4,5,12 | 3,4,15,14,37 | GND | These pins must be connected to OV. |
| 2 | 39 | DV ${ }_{\text {cc }}$ | Digital Supply Pin. Voltage ranges from 2.7 V to 5.5 V . |
| 3 | 2 | $\overline{\text { FAULT }}$ | Fault alert, This pin is asserted low when an open circuit is detected in current mode or an over temperature is detected. Open drain output, must be connected to a pull-up resistor. |
| 17,18,21,22, 23 | $\begin{aligned} & 1,10,11,19 \\ & 20,21,22,24,25, \\ & 30,31,32,33,34 \\ & 35,38,40 \end{aligned}$ | NC | No Connection. |
| 6 | 5 | CLEAR | Active High Input. Asserting this pin will set the current output to the bottom of the selected range. |
| 7 | 6 | LATCH | Positive edge sensitive latch, a rising edge will parallel load the input shift register data into the DAC register, also updating the output. |
| 8 | 7 | SCLK | Serial Clock Input. Data is clocked into the shift register on the rising edge of SCLK. This operates at clock speeds up to 30 MHz . |
| 9 | 8 | SDIN | Serial Data Input. Data must be valid on the rising edge of SCLK. |
| 10 | 9 | SDO | Serial Data Output. Used to clock data from the serial register in daisy-chain or readback mode. Data is clocked out on the falling edge of SCLK. See Figure 3 and Figure 4. |
| 11 | 12 | AGND | Ground reference pin for analog circuitry. |
| N/A | 13 | DGND | Ground reference pin for digital circuitry. (AGND and DGND are internally connected in TSSOP package). |
| 13 | 16 | Rset | An external, precision, low drift $15 \mathrm{k} \Omega$ current setting resistor can be connected to this pin to improve the lout temperature drift performance. Refer to Features section. |
| 14 | 17 | REFOUT | Internal Reference Voltage Output. REFOUT $=5 \mathrm{~V} \pm 2 \mathrm{mV}$. |
| 15 | 18 | REFIN | External Reference Voltage Input. Reference input range is 4 V to 5 V . REFIN $=5 \mathrm{~V}$ for specified performance. |
| 16 | 23 | DVcc <br> SELECT | This pin when connected to GND disables the internal supply and an external supply must be connected to the $\mathrm{DV}_{\text {cc }}$ pin. Leave this pin unconnected to enable the internal supply. Refer to features section. |
| 19 | 26 | lout | Current output pin. |
| 20 | 27 | BOOST | Optional external transistor connection. Connecting an external transistor will reduce the power dissipated in the AD5410/AD5420. Refer to the features section. |
| N/A | 28 | CAP1 | Connection for optional output filtering capacitor. Refer to Features section. |
| N/A | 29 | CAP2 | Connection for optional output filtering capacitor. Refer to Features section. |
| 24 | 36 | AV ${ }_{\text {DD }}$ | Positive Analog Supply Pin. Voltage ranges from 10.8V to 40V/60V. |
| Paddle | Paddle | AGND | Ground reference for analog circuitry. |

## TERMINOLOGY

## Relative Accuracy or Integral Nonlinearity (INL)

For the DAC, relative accuracy, or integral nonlinearity (INL), is a measure of the maximum deviation, in LSBs, from a straight line passing through the endpoints of the DAC transfer function. A typical INL vs. code plot can be seen in Figure 7

## Differential Nonlinearity (DNL)

Differential nonlinearity (DNL) is the difference between the measured change and the ideal 1 LSB change between any two adjacent codes. A specified differential nonlinearity of $\pm 1$ LSB maximum ensures monotonicity. This DAC is guaranteed monotonic by design. A typical DNL vs. code plot can be seen in Figure 8.

## Monotonicity

A DAC is monotonic if the output either increases or remains constant for increasing digital input code. The AD5724R/ AD5734R/AD5754R are monotonic over their full operating temperature range.

## Full-Scale Error

Full-Scale error is a measure of the output error when full-scale code is loaded to the DAC register. Ideally, the output should be full-scale - 1 LSB. Full-scale error is expressed in percent of full-scale range (\% FSR).

## Zero-Scale TC

This is a measure of the change in zero-scale error with a change in temperature. Zero-scale error TC is expressed in ppm FSR/ $/{ }^{\circ} \mathrm{C}$.

## Gain Error

This is a measure of the span error of the DAC. It is the deviation in slope of the DAC transfer characteristic from ideal expressed in \% FSR. A plot of gain error vs. temperature can be seen in Table TBD

## Gain TC

This is a measure of the change in gain error with changes in temperature. Gain Error TC is expressed in $\mathrm{ppm} \mathrm{FSR} /{ }^{\circ} \mathrm{C}$.

## Total Unadjusted Error

Total unadjusted error (TUE) is a measure of the output error taking all the various errors into account, namely INL error, offset error, gain error, and output drift over supplies, temperature, and time. TUE is expressed in \% FSR.

## Current Loop Voltage Compliance

The maximum voltage at the Iout pin for which the output currnet will be equal to the programmed value.

Power Supply Rejection Ratio (PSRR)
PSRR indicates how the output of the DAC is affected by changes in the power supply voltage.

## Reference TC

Reference TC is a measure of the change in the reference output voltage with a change in temperature. It is expressed in $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$.

## Line Regulation

Line regulation is the change in reference output voltage due to a specified change in supply voltage. It is expressed in $\mathrm{ppm} / \mathrm{V}$.

## Load Regulation

Load regulation is the change in reference output voltage due to a specified change in load current. It is expressed in $\mathrm{ppm} / \mathrm{mA}$.

## Thermal Hysteresis

Thermal hysteresis is the change of reference output voltage after the device is cycled through temperatures from $+25^{\circ} \mathrm{C}$ to $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ and back to $+25^{\circ} \mathrm{C}$. This is a typical value from a sample of parts put through such a cycle. See Table TBDfor a histogram of thermal hysteresis.

$$
\begin{aligned}
& V_{O_{-} H Y S}=V_{O}\left(25^{\circ} \mathrm{C}\right)-V_{O_{-} T C} \\
& V_{O_{-} H Y S}(p p m)=\frac{V_{O}\left(25^{\circ} \mathrm{C}\right)-V_{O_{-} T C}}{V_{O}\left(25^{\circ} \mathrm{C}\right)} \times 10^{6}
\end{aligned}
$$

where:

$$
\begin{aligned}
& V_{O}\left(25^{\circ} \mathrm{C}\right)=V_{\mathrm{O}} \text { at } 25^{\circ} \mathrm{C} \\
& V_{O_{-} T \mathrm{C}}=\mathrm{V}_{\mathrm{O}} \text { at } 25^{\circ} \mathrm{C} \text { after temperature cycle }
\end{aligned}
$$

## THEORY OF OPERATION

The AD5410/AD5420 is a precision digital to current loop output converter designed to meet the requirements of industrial process control applications. It provides a high precision, fully integrated, low cost single-chip solution for generating current loop outputs. The current ranges available are; 0 to $20 \mathrm{~mA}, 0$ to 24 mA and 4 to 20 mA , The desired output configuration is user selectable via the CONTROL register.

## ARCHITECTURE

The DAC core architecture of the AD5410/AD5420 consists of two matched DAC sections. A simplified circuit diagram is shown in Figure 33. The 4 MSBs of the 12/16-bit data word are decoded to drive 15 switches, E1 to E15. Each of these switches connects 1 of 15 matched resistors to either ground or the reference buffer output. The remaining $8 / 12$ bits of the dataword drive switches S0 to S11 of a $8 / 12$-bit voltage mode R-2R ladder network.

Figure 33. DAC Ladder Structure
The voltage output from the DAC core is converted to a current (see diagram, Figure 34) which is then mirrored to the supply rail so that the application simply sees a current source output with respect to ground.

Figure 34. Voltage to Current conversion circuitry

## Reference Buffers

The AD5410/AD5420 can operate with either an external or internal reference. The reference input has an input range of 4 V to $5 \mathrm{~V}, 5 \mathrm{~V}$ for specified performance. This input voltage is then buffered before it is applied to the DAC.

## SERIAL INTERFACE

The AD5410/AD5420 is controlled over a versatile 3-wire serial interface that operates at clock rates up to 30 MHz . It is compatible with SPI $^{\bullet}$, QSPI $^{\text {me }}$, MICROWIRE ${ }^{\text {me }}$, and DSP standards.

## Input Shift Register

The input shift register is 24 bits wide. Data is loaded into the device MSB first as a 24 -bit word under the control of a serial clock input, SCLK. Data is clocked in on the rising edge of SCLK. The input register consists of 8 control bits and 16 data bits as shown in

Table 7. The 24 bit word is unconditionally latched on the rising edge of LATCH. Data will continue to be clocked in irrespective of the state of LATCH, on the rising edge of LATCH the data that is present in the input register will be latched, in other words the last 24 bits to be clocked in before the rising edge of

LATCH will be the data that is latched. The timing diagram for this operation is shown in Figure 2.

| 01010110 |  | RESET Register |  |  |  |  |  |  |  |  |

## Standalone Operation

The serial interface works with both a continuous and noncontinuous serial clock. A continuous SCLK source can only be used if LATCH is taken high after the correct number of data bits have been clocked in. In gated clock mode, a burst clock containing the exact number of clock cycles must be used, and LATCH must be taken high after the final clock to latch the data. The first rising edge of SCLK that clocks in the MSB of the dataword marks the beginning ot the write cycle. Exactly 24 rising clock edges must be applied to SCLK before LATCH is brought high. If LATCH is brought high before the $24^{\text {th }}$ rising SCLK edge, the data written will be invalid. If more than 24 rising SCLK edges are applied before LATCH is brought high, the input data will also be invalid.
DATA WORD

*ADDITIONAL PINS OMITTED FOR CLARITY
Figure 35. Daisy Chaining the AD5410/AD5420

## Daisy-Chain Operation

For systems that contain several devices, the SDO pin can be used to daisy chain several devices together as shown in Figure 35. This daisy-chain mode can be useful in system diagnostics and in reducing the number of serial interface lines. Daisychain mode is enabled by setting the DCEN bit of the CONTROL register. The first rising edge of SCLK that clocks in the MSB of the dataword marks the beginning of the write cycle. SCLK is continuously applied to the input shift register. If more than 24 clock pulses are applied, the data ripples out of the shift register and appears on the SDO line. This data is valid on the rising edge of SCLK having been clocked out on the previous falling SCLK edge. By connecting the SDO of the first device to the SDIN input of the next device in the chain, a multidevice interface is constructed. Each device in the system requires 24 clock pulses. Therefore, the total number of clock cycles must equal $24 \times N$, where $N$ is the total number of AD5410/AD5420 devices in the chain. When the serial transfer to all devices is complete, LATCH is taken high. This latches the input data in each device in the daisy chain. The serial clock can be a continuous or a gated clock.
A continuous SCLK source can only be used if LATCH is taken high after the correct number of clock cycles. In gated clock mode, a burst clock containing the exact number of clock cycles
must be used, and LATCH must be taken high after the final clock to latch the data. See Figure 4 for a timing diagram.

## Readback Operation

Readback mode is invoked by setting the address word and read address as shown in Table 9 and Table 10 when writing to the input register. The next write to the AD5410/AD5420 should be a NOP command which will clock out the data from the previously addressed register as shown in Figure 3. By default the SDO pin is disabled, after having addressed the AD5410/AD5420 for a read operation, a rising edge on LATCH will enable the SDO pin in anticipation of data being clocked out, after the data has been clocked out on SDO, a rising edge on LATCH will disable (tri-state) the SDO pin once again. To read back the data register for example, the following sequence should be implemented:

1. Write $0 \times 020001$ to the AD5410/AD5420 input register. This configures the part for read mode with the data register selected.
2. Follow this with a second write, a NOP condition, $0 x 000000$ During this write, the data from the register is clocked out on the SDO line.

Table 9. Input Shift Register Contents for a read operation

## POWER-UP STATE

On power-up of the AD5410/AD5420, the power-on-reset circuit ensures that all registers are loaded with zero-code, as such the output will be disabled (tri-state).

## TRANSFER FUNCTION

For the 0 to $20 \mathrm{~mA}, 0$ to 24 mA and 4 to 20 mA current output ranges the output current is respectively expressed as;

$$
\begin{gathered}
I_{\text {OUT }}=\left[\frac{20 m A}{2^{N}}\right] \times D \\
I_{\text {OUT }}=\left[\frac{24 m A}{2^{N}}\right] \times D \\
I_{\text {OUT }}=\left[\frac{16 m A}{2^{N}}\right] \times D+4 m A
\end{gathered}
$$

where:
$D$ is the decimal equivalent of the code loaded to the DAC.
$N$ is the bit resolution of the DAC.

## DATA REGISTER

The DATA register is addressed by setting the control word of the input shift register to $0 \times 01$. The data to be written to the DATA register is entered in positions D15 to D4 for the AD5410 and D15 to D0 for the AD5420 as shown in Table 11 and Table 12.

## AD5410/AD5420

## RESET REGISTER

The RESET register is addressed by setting the control word of the input shift register to $0 \times 56$. The data to be written to the RESET register is entered in positions D15 to D0 as shown in Table 16. The RESET register options are shown in Table 16 and Table 17.

| Option | Description |
| :--- | :--- |
| lout FAULT | This bit will be set if a fault is detected on the lout pin. |
| SLEW ACTIVE | This bit will be set while the output value is slewing (slew rate control enabled) |
| OVER TEMP | This bit will be set if the AD5410/AD5420 core temperature exceeds approx. $150^{\circ} \mathrm{C}$. |

## FEATURES

## FAULT ALERT

The AD5410/AD5420 is equipped with a FAULT pin, this is an open-drain output allowing several AD5410/AD5420 devices to be connected together to one pull-up resistor for global fault detection. The FAULT pin is forced active by any one of the following fault scenarios;

1) The Voltage at Iout attempts to rise above the compliance range, due to an open-loop circuit or insufficient power supply voltage. The Iout current is controlled by a PMOS transistor and internal amplifier as shown in Figure 34. The internal circuitry that develops the fault output avoids using a comparator with "window limits" since this would require an actual output error before the FAULT output becomes active. Instead, the signal is generated when the internal amplifier in the output stage has less than approxiamately one volt of remaining drive capability (when the gate of the output PMOS transistor nearly reaches ground). Thus the FAULT output activates slightly before the compliance limit is reached. Since the comparison is made within the feedback loop of the output amplifier, the output accuracy is maintained by its open-loop gain and an output error does not occur before the FAULT output becomes active.
2) If the core temperature of the AD5410/AD5420 exceeds approx. $150^{\circ} \mathrm{C}$.
The OPEN CCT and OVER TEMP bits of the STATUS register are used in conjunction with the FAULT pin to inform the user which one of the fault conditions caused the FAULT pin to be asserted. See Table 18 and Table 19.

## ASYNCHRONOUS CLEAR (CLEAR)

CLEAR is an active high clear that clears the Current output to the bottom of its programmed range. It is necessary to maintain CLEAR high for a minimum amount of time (see Figure 2) to complete the operation. When the CLEAR signal is returned low, the output remains at the cleared value. The pre-clear value can be restored by pulsing the LATCH signal low without clocking any data. A new value cannot be programmed until the CLEAR pin is returned low.

## INTERNAL REFERENCE

The AD5410/AD5420 contains an integrated +5 V voltage reference with initial accuracy of $\pm 2 \mathrm{mV}$ max and a temperature drift coefficient of $\pm 10 \mathrm{ppm}$ max. The reference voltage is buffered and externally available for use elsewhere within the system. See Figure 32 for a load regulation graph of the Integrated reference.

## EXTERNAL CURRENT SETTING RESISTOR

Referring to Figure 34, R1 is an internal sense resistor as part of the voltage to current conversion circuitry. The stability of the output current over temperature is dependent on the stability of the value of R1. As a method of improving the stability of the output current over temperature an external precision $15 \mathrm{k} \Omega$ low drift resistor can be connected to the $\mathrm{R}_{\text {SET }}$ pin of the AD5410/AD5420 to be used instead of the internal resistor R1. The external resistor is selected via the CONTROL 1 register. See Table 13.

## DIGITAL POWER SUPPLY

By default, the DV cc pin accepts a power supply of 2.7 V to 5.5 V , alternatively, via the $\mathrm{DV}_{\mathrm{CC}}$ SELECT pin an internal 4.5 V power supply may be output on the $\mathrm{DV}_{\mathrm{CC}}$ pin for use as a digital power supply for other devices in the system or as a termination for pull-up resistors. This facility offers the advantage of not having to bring a digital supply across an isolation barrier. The internal power supply is enabled by leaving the DV ${ }_{c c}$ SELECT pin unconnected. To disable the internal supply DV $\operatorname{cc}$ SELECT should be tied to 0 V . DVCC is capable of supplying up to 5 mA of current, for a load regulation graph see Figure TBD.

## EXTERNAL BOOST FUNCTION

The addition of an external boost transistor as shown in Figure 36 will reduce the power dissipated in the AD5410/AD5420 by reducing the current flowing in the on-chip output transistor (dividing it by the current gain of the external circuit). A discrete NPN transistor with a breakdown voltage, $\mathrm{BV}_{\text {CEO }}$, greater than 60 V can be used.
The external boost capability has been developed for those users who may wish to use the AD5410/AD5420 at the extremes of the supply voltage, load current and temperature range. The boost transistor can also be used to reduce the amount of temperature induced drift in the part. This will minimise the temperature induced drift of the on-chip voltage reference, which improves drift and linearity.

Figure 36. External Boost Configuration

## DIGITAL SLEW RATE CONTROL

The Slew Rate Control feature of the AD5410/AD5420 allows the user to control the rate at which the output current changes. With the slew rate control feature disabled the output currrent will change at a rate limited by the output drive circuitry and the attached load. If the user wishes to reduce the slew rate this can be achieved by enabling the slew rate control feature. With the feature enabled via the SREN bit of the CONTROL register, (See Table 13) the output, instead of slewing directly between two values, will step digitally at a rate defined by two parameters accessible via the CONTROL register as shown in Table 13. The parameters are SR CLOCK and SR STEP. SR CLOCK defines the rate at which the digital slew will be updated SR STEP defines by how much the output value will change at each update. Together both parameters define the rate of change of the output current.Table 20 and Table 21 outline the range of values for both the SR CLOCK and SR STEP parameters.

Table 20. Slew Rate Update Clock Options

| SR CLOCK | Update Clock Frequency (Hz) |
| :---: | :---: |
| 0000 | 257732 |
| 0001 | 198413 |
| 0010 | 152439 |
| 0011 | 131579 |
| 0100 | 115741 |
| 0101 | 69444 |
| 0110 | 37594 |
| 0111 | 25773 |
| 1000 | 20161 |
| 1001 | 16026 |
| 1010 | 10288 |
| 1011 | 8278 |
| 1100 | 6897 |
| 1101 | 5525 |
| 1110 | 4237 |
| 1111 | 3300 |

Table 21. Slew Rate Step Size Options

| SR STEP | AD5410 Step <br> Size (LSBs) | AD5420 Step <br> Size (LSBs) |
| :---: | :---: | :---: |
| 000 | $1 / 16$ | 1 |
| 001 | $1 / 8$ | 2 |
| 010 | $1 / 4$ | 4 |
| 011 | $1 / 2$ | 8 |
| 100 | 1 | 16 |
| 101 | 2 | 32 |
| 110 | 4 | 64 |
| 111 | 8 | 128 |

The time it will take for the output current to slew over a given output range can be expressed as follows.

$$
\text { SlewTime }=\frac{\text { OutputChange }}{\text { StepSize } \times \text { UpdateClockFrequency } \times \text { LSBSize }}
$$

Where:
Slew Time is expressed in seconds
Output Change is expressed in Amps
When the slew rate control feature is enabled, all output changes will change at the programmed slew rate, i.e. if the CLEAR pin is asserted the output will slew to the clear value at the programmed slew rate. The output can be halted at its current value with a write to the CONTROL register. To avoid halting the output slew, the SLEW ACTIVE bit can be read to check that the slew has completed before writing to the AD5410/AD5420 registers. See Table 18. The update clock frequency for any given value will be the same for all output ranges. The step size however will vary across output ranges for a given value of step size as the LSB size will be different for each output range. Table 22 shows the range of programmable slew times for a full-scale change on any of the output ranges. The values were obtained using the Slew Time equation above.

Table 22. Programmable Slew Time values in seconds for a full scale change on any output range.

|  |  | Step Size (LSBs) |  |  |  |  |  |  |  |

## $I_{\text {out }}$ FILTERING CAPACITORS (LFCSP PACKAGE)

Two capacitors may be placed between the pins CAP1, CAP2 and $A V_{\text {DD }}$ as shown in Figure 37.

Figure 37. Iout Filtering Capacitors
These two pins are only available on the LFCSP package.The capacitors form a filter on the current output circuitry as shown in Figure 38, reducing the bandwidth and the rate of change of the output current. These capacitors can be used as an
alternative to the Digital Slew Rate Control feature or in addition to it as a means of smoothing out the steps caused by the digital code increments.

Figure 38. Iout Filter Ciruitry

## APPLICATIONS INFORMATION

## DRIVING INDUCTIVE LOADS

When driving inductive or poorly defined loads connect a $0.01 \mu \mathrm{~F}$ capacitor between Iout and GND. This will ensure stability with loads beyond 50 mH . There is no maximum capacitance limit. The capacitive component of the load may cause slower settling, The digital Slew Rate Control feature may also prove useful in this situation.

## TRANSIENT VOLTAGE PROTECTION

The AD5410/AD5420 contains ESD protection diodes which prevent damage from normal handling. The industrial control environment can, however, subject I/O circuits to much higher transients. In order to protect the AD5410/AD5420 from excessively high voltage transients, external power diodes and a surge current limiting resistor may be required, as shown in Figure 39. The constraint on the resistor value is that during normal operation the output level at IOUT must remain within its voltage compliance limit of $A V_{D D}-2.5 \mathrm{~V}$ and the two protection diodes and resistor must have appropriate power ratings. Further protection can be provided with Transient Voltage Suppressors or Transorbs, these are available as both unidirectional (protects against positive high voltage transients) and bidirectional (protects against both positive and negative high voltage transients) and are available in a wide range of standoff and breakdown voltage ratings. It is recommended that all field connected nodes are protected.

Figure 39. Output Transient Voltage Protection

## LAYOUT GUIDELINES

In any circuit where accuracy is important, careful consideration of the power supply and ground return layout helps to ensure the rated performance. The printed circuit board on which the AD5410/AD5420 is mounted should be designed so that the analog and digital sections are separated and confined to certain areas of the board. If the AD5410/AD5420 is in a system where multiple devices require an AGND-to-DGND connection, the connection should be made at one point only. The star ground point should be established as close as possible to the device.
The AD5410/AD5420 should have ample supply bypassing of $10 \mu \mathrm{~F}$ in parallel with $0.1 \mu \mathrm{~F}$ on each supply located as close to the package as possible, ideally right up against the device. The $10 \mu \mathrm{~F}$ capacitors are the tantalum bead type. The $0.1 \mu \mathrm{~F}$ capacitor should have low effective series resistance (ESR) and low effective series inductance (ESI) such as the common
ceramic types, which provide a low impedance path to ground at high frequencies to handle transient currents due to internal logic switching.
The power supply lines of the AD5410/AD5420 should use as large a trace as possible to provide low impedance paths and reduce the effects of glitches on the power supply line. Fast switching signals such as clocks should be shielded with digital ground to avoid radiating noise to other parts of the board and should never be run near the reference inputs. A ground line routed between the SDIN and SCLK lines helps reduce crosstalk between them (not required on a multilayer board that has a separate ground plane, but separating the lines helps). It is essential to minimize noise on the REFIN line because it couples through to the DAC output.
Avoid crossover of digital and analog signals. Traces on opposite sides of the board should run at right angles to each other. This reduces the effects of feed through the board. A microstrip technique is by far the best, but not always possible with a double-sided board. In this technique, the component side of the board is dedicated to ground plane, while signal traces are placed on the solder side.

## GALVANICALLY ISOLATED INTERFACE

In many process control applications, it is necessary to provide an isolation barrier between the controller and the unit being controlled to protect and isolate the controlling circuitry from any hazardous common-mode voltages that might occur. The $i$ Coupler ${ }^{\circledR}$ family of products from Analog Devices provides voltage isolation in excess of 2.5 kV . The serial loading structure of the AD5410/AD5420 make it ideal for isolated interfaces because the number of interface lines is kept to a minimum. Figure 40 shows a 4-channel isolated interface to the AD5410/AD5420 using an ADuM1400. For further information, visit http://www.analog.com/icouplers.

*ADDITIONAL PINS OMITTED FOR CLARITY

## Figure 40. Isolated Interface

## MICROPROCESSOR INTERFACING

Microprocessor interfacing to the AD5410/AD5420 is via a serial bus that uses protocol compatible with microcontrollers and DSP processors. The communications channel is a 3 -wire (minimum) interface consisting of a clock signal, a data signal,
and a latch signal. The AD5410/AD5420 require a 24 -bit dataword with data valid on the rising edge of SCLK.
For all interfaces, the DAC output update is initiated on the rising edge of LATCH. The contents of the registers can be read using the readback function.

## THERMAL AND SUPPLY CONSIDERATIONS

The AD5410/AD5420 is designed to operate at a maximum junction temperature of $125^{\circ} \mathrm{C}$. It is important that the device is not operated under conditions that will cause the junction temperature to exceed this value. Excessive junction temperature can occur if the AD5410/AD5420 is operated from the maximum $A V_{D D}$ and driving the maximum current ( 24 mA ) directly to ground. In this case the ambient temperature should

Figure 41. Maximum Power Dissipation Vs Ambient Temperature
be controlled or AV DD should be reduced. The conditions will depend on the device and package.
At maximum ambient temperature of $85^{\circ} \mathrm{C}$ the AD5410/AD5420AREZ (24-lead TSSOP) can dissipate 950 mW and the AD5410/AD5420ACPZ (40-lead LFCSP) can dissipate 1.42 W .

To ensure the junction temperature does not exceed $125^{\circ} \mathrm{C}$ while driving the maximum current of 24 mA directly into ground (also adding an on-chip current of 3 mA ), AV $\operatorname{DD}$ should be reduced from the maximum rating to ensure the package is not required to dissipate more power than stated above. See Table 23, Figure 41 and Figure 42.

Figure 42. Maximum Supply Voltage Vs Ambient Temperature

Table 23. Thermal and Supply considerations for each package

|  | TSSOP | LFCSP |
| :---: | :---: | :---: |
| Maximum allowed power dissipation when operating at an ambient temperature of $85^{\circ} \mathrm{C}$ | $\frac{T_{J} \max -T_{A}}{\Theta_{\mathrm{JA}}}=\frac{125-85}{42}=950 \mathrm{~mW}$ | $\frac{T_{J} \max -T_{A}}{\Theta_{\mathrm{JA}}}=\frac{125-85}{28}=1.42 \mathrm{~W}$ |
| Maximum allowed ambient temperature when operating from a supply of $40 \mathrm{~V} / 60 \mathrm{~V}$ and driving 24 mA directly to ground. | $T_{J} \max -P_{D} \times \Theta_{J A}=125-(40 \times 0.027) \times 42=79^{\circ} \mathrm{C}$ | $T_{J} \max -P_{D} \times \Theta_{J A}=125-(60 \times 0.027) \times 28=79^{\circ} \mathrm{C}$ |
| Maximum allowed supply voltage when operating at an ambient temperature of $85^{\circ} \mathrm{C}$ and driving 24 mA directly to ground. | $\frac{T_{J} \max -T_{A}}{A I_{D D} \times \Theta_{J A}}=\frac{125-85}{0.027 \times 42}=35 \mathrm{~V}$ | $\frac{T_{J} \max -T_{A}}{A I_{D D} \times \Theta_{J A}}=\frac{125-85}{0.027 \times 28}=53 \mathrm{~V}$ |

## OUTLINE DIMENSIONS

ORDERING GUIDE

| Model | Resolution | AV $_{\text {DD }}$ max | Temperature Range | Package Description | Package Option |
| :--- | :--- | :--- | :--- | :--- | :--- |
| AD5410AREZ | 12 Bits | 40 V | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | 24 Lead TSSOP_EP | RE-24 |
| AD5410ACPZ | 12 Bits | 60 V | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | 40 Lead LFCSP | CP-40 |
| AD5420AREZ | 16 Bits | 40 V | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | 24 Lead TSSOP_EP | RE-24 |
| AD5420ACPZ | 16 Bits | 60 V | $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ | 40 Lead LFCSP | CP-40 |

## NOTES

[^0]:    ${ }^{1}$ Maximum supply for the AD5410/AD5420BREZ is 40V, Maximum supply for the AD5410/AD5420BCPZ is 60V
    ${ }^{2}$ Temperature range: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$; typical at $+25^{\circ} \mathrm{C}$.
    ${ }^{3}$ Guaranteed by design and characterization, not production tested.

[^1]:    C Maximum supply for the AD5410/AD5420BREZ is 40V, Maximum supply for the AD5410/AD5420BCPZ is 60V
    ${ }^{2}$ Guaranteed by design and characterization, not production tested.

[^2]:    ${ }^{1}$ Maximum supply for the AD5410/AD5420AREZ is 40V, Maximum supply for the AD5410/AD5420ACPZ is 60V
    ${ }^{2}$ Guaranteed by characterization. Not production tested.
    ${ }^{3}$ All input signals are specified with $\mathrm{t}_{\mathrm{R}}=\mathrm{t}_{\mathrm{F}}=5 \mathrm{~ns}\left(10 \%\right.$ to $90 \%$ of $\left.\mathrm{DV} \mathrm{CC}_{\mathrm{C}}\right)$ and timed from a voltage level of 1.2 V .
    ${ }^{4}$ See Figure 2, Figure 3, and Figure 4.
    ${ }^{5} \mathrm{C}_{\text {LSDO }}=$ Capacitive load on SDO output.

[^3]:    ${ }^{1}$ Power dissipated on chip must be de-rated to keep junction temperature below $125^{\circ} \mathrm{C}$. Assumption is max power dissipation condition is sourcing 24 mA into Ground from $A V_{D D}$ with a 3 mA on-chip current.
