

# 12/10/8-Bit Low Power Dual DACs With Serial Interface and Voltage Output

#### **FEATURES**

- 12/10/8-Bit Dual DAC in 08 Lead MSOP Package
- Ultra-Low Power Consumption
- Guaranteed Monotonic
- Wide Output Voltage Swing
- Three-wire SPI/QSP and Microwire Interface Compatible
- Three Software-Selectable Power-Down Output Impedances (1 K Ohm, 100 K Ohm and Hi-Z)
- Schmitt-Triggered Inputs for Direct Interfacing to Opto-couplers

## **APPLICATION**

- Battery-Powered Applications
- Industrial Process Control
- Digital Gain and Offset Adjustment

## **BLOCK DIAGRAM**

#### **OVERVIEW**

The ICM7562, ICM7542 and ICM7522 are 12-Bit, 10-Bit and 8-Bit Voltage Output, Low Power, Dual DACs respectively, with guaranteed monotonic behavior. These DACs are available in 08 Lead MSOP package. They have three Software-Selectable Power-Down Output Impedances (1 K Ohm, 100 K Ohm and Hi-Z) as additional safety feature for applications that drive transducers or valves. The operating supply range is 2.7V to 5.5V.

The input interface is an easy to use three-wire SPI, QSPI and Microwire compatible interface. The DAC has Schmitt-Triggered Inputs for Direct Interfacing to Opto-couplers easily.

# **PACKAGE**

# PIN DESCRIPTION (8 Lead MSOP)

| Pin | Name  | I/O | Description                        |  |  |  |  |  |  |  |  |
|-----|-------|-----|------------------------------------|--|--|--|--|--|--|--|--|
| 1   | VDD   | I   | Supply Voltage                     |  |  |  |  |  |  |  |  |
| 2   | GND   | I   | Pround                             |  |  |  |  |  |  |  |  |
| 3   | CS    | I   | Active Low Chip Select (CMOS)      |  |  |  |  |  |  |  |  |
| 4   | SCK   | I   | Serial Clock Input (CMOS)          |  |  |  |  |  |  |  |  |
| 5   | SDI   | I   | Serial Data Input (CMOS)           |  |  |  |  |  |  |  |  |
| 6   | REFIN | I   | Reference Voltage Input to DAC A-B |  |  |  |  |  |  |  |  |
| 7   | VOA   | 0   | DAC A Output Voltage               |  |  |  |  |  |  |  |  |
| 8   | VOB   | 0   | DAC B Output Voltage               |  |  |  |  |  |  |  |  |

## **ABSOLUTE MAXIMUM RATINGS**

| Symbol              | Parameter                                 | Value       | Unit |
|---------------------|---|-------------|------|
| V <sub>DD</sub>     | Supply Voltage                            | -0.3 to 7.0 | V    |
| I <sub>IN</sub>     | Input Current                             | +/- 25.0    | mA   |
| V <sub>IN</sub> _   | Digital Input Voltage (SCK, SDI, CLR, CS) | -0.3 to 7.0 | V    |
| V <sub>IN_REF</sub> | Reference Input Voltage                   | -0.3 to 7.0 | V    |
| T <sub>STG</sub>    | Storage Temperature                       | -65 to +150 | °C   |
| Tsol                | Soldering Temperature                     | 300         | °C   |

Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## ORDERING INFORMATION

| Part    | Operating Temperature Range | Package      |
|---------|-----------------------------|--------------|
| ICM7562 | -40 °C to 85 °C             | 08-Lead MSOP |
| ICM7542 | -40 °C to 85 °C             | 08-Lead MSOP |
| ICM7522 | -40 °C to 85 °C             | 08-Lead MSOP |

## DC ELECTRICAL CHARACTERISTICS

( $V_{DD}$  = 2.7V to 5.5V,  $V_{OUT}$  unloaded; all specifications  $T_{MIN}$  to  $T_{MAX}$  unless otherwise noted)

**Table 2. Power Down Mode Control** 

#### DETAILED DESCRIPTION

The ICM7562 is a 12-bit voltage output Dual DAC. The ICM7542 is the 10-bit version of this family and the ICM7522 is the 8-bit version. These devices have a 16-bit data-in shift register and each DAC has a double buffered input.

This family of DACs has a guaranteed monotonic behavior. The operating supply range is from 2.7V to 5.5V.

## Reference Input

The reference input accepts positive DC and AC signals. The voltage at REFIN sets the full-scale output voltage of both the DACs. The reference input voltage range is from 0 to VDD-1.5V. The impedance at this pin is very high (greater than 10 M Ohm). Each DACs output amplifier is configured in a gain of 2 configuration. This means that the full-scale output of each DAC will be  $2x\ V_{REF}$ . To determine the output voltage for any code, use the following equation.

$$V_{OUT} = 2 x (V_{REF} x (D / (2^n)))$$

Where D is the numeric value of DAC's decimal input code,  $V_{REF}$  is the reference voltage and n is number of bits, i.e. 12 for ICM7562, 10 for ICM7542 and 8 for ICM7522.

## **Output Buffer Amplifier**

The Dual DAC has 2 output amplifiers connected in a gain of 2 configuration. These amplifiers have a wide output voltage swing. The actual swing of the output amplifiers will be limited by offset error and gain error. See the Applications Information section for a more detailed discussion.

The output amplifier can drive a load of 2.0 K  $\Omega$  to  $V_{DD}$  or GND in parallel with a 500 pF load capacitance.

The output amplifier has a full-scale typical settling time of 8  $\mu s$  and it dissipates about 100  $\mu A$  with a 3V supply voltage.

## Serial Interface and Input Logic

This dual DAC family uses a standard 3-wire connection compatible with SPI/QSPI and Microwire interfaces. Data is always loaded in 16-bit words which consist of 4 address and control bits (MSBs) followed by 12 bits (see Figure .3). The last 5 bits of this 12 bit word are also used for power down control (see tables 1 and 2). Each DAC is double buffered with an input latch and DAC latch.

## Serial Data Input

SDI (Serial Data Input) pin is the data input pin for all DACs. Data is clocked in on the falling edge of SCK which has a Schmitt trigger internally to allow for noise immunity on the SCK pin. This specially eases the use for opto-coupled interfaces.

The Chip Select pin which is the 3<sup>rd</sup> pin of 8 lead MSOP package is active low. This pin frames the input data for

synchronous loading and must be low when data is being clocked into the part. There is an onboard counter on the clock input and after the 16<sup>th</sup> clock pulse the data is automatically transferred to a 16-bit input latch and the 4 bit control word (C3~C0) is then decoded and the appropriate DAC is updated or loaded depending on the control word (see Table 1). Chip Select pin must be pulled high (level-triggered) and back low for the next data word to be loaded in. This pin also disables the SCK pin internally when pulled high.

The DAC has a double-buffered input with an input latch and a DAC latch. The DAC output will swing to its new value when data is loaded into the DAC latch. The user has three options: loading only the input latch, updating the DAC with data previously loaded into the input latch or loading the input latch and updating the DAC at the same time with a new code. The actual data that gets loaded into the DAC latch is D11~D0 for the ICM7562, D9~D0 for the ICM7542 and D7~D0 for the ICM 7522.

#### Power-Down Mode

The DAC have three Software-Selectable Power-Down Output Impedances (1 K Ohm, 100 K Ohm and Hi-Z) as additional safety feature for applications that drive transducers or valves. The power down can be done with loading the control word with 1111 (C0 to C3). The selection of the Output Impedance of DAC is controlled by the last 5 bits. See Table 1 and Table 2 for details of operation of this function.

## Power-On Reset

There is a power-on reset on board that will clear the contents of all the latches to all 0s on power-up and the DAC voltage output will go to ground.

#### **APPLICATIONS INFORMATION**

## **Power Supply Bypassing and Layout Considerations**

As in any precision circuit, careful consideration has to be given to layout of the supply and ground. The return path from the GND to the supply ground should be short with low impedance. Using a ground plane would be ideal. The supply should have some bypassing on it. A 10  $\mu F$  tantalum capacitor in parallel with a 0.1  $\mu F$  ceramic with a low ESR can be used. Ideally these would be placed as close as possible to the device. Avoid crossing digital and analog signals, specially the reference, or running them close to each other.

## **Output Swing Limitations**

The ideal rail-to-rail DAC would swing from GND to V<sub>DD</sub>. However, offset and gain error limit this ability. Figure 4 illustrates how a negative offset error will affect the output. The output will limit close to ground since this is single supply part, resulting in a dead-band area. As a larger input is loaded into the DAC the output will eventually rise above ground. This is why the linearity is specified for a starting code greater than zero.

Figure 5 illustrates how a gain error or positive offset error will affect the output when it is close to  $V_{\rm DD}$ . A positive gain error or positive offset will cause the output to be limited to the positive supply voltage resulting in a dead-band of codes close to full-scale.
