4-bit universal shift register

HEF40195B MSI

DESCRIPTION

The HEF40195B is a fully synchronous edge-triggered 4-bit shift register with a clock input (CP), four synchronous parallel data inputs (P₀ to P₃), two synchronous serial data inputs (J, \bar{K}), a synchronous parallel enable input (\overline{PE}), buffered parallel outputs from all 4-bit positions (O₀ to O₃), a buffered inverted output from the last bit position (\overline{O}_3) and an overriding asynchronous master reset input (\overline{MR}). Each register stage is of a D-type master-slave flip-flop. Operation is synchronous (except for \overline{MR}) and is edge-triggered on the LOW to HIGH transition of the CP

input. When \overline{PE} is LOW, data are loaded into the register from P₀ to P₃ on the LOW to HIGH transition of CP. When \overline{PE} is HIGH, data are shifted into the first register position from J and \bar{K} and all the data in the register are shifted one position to the right on the LOW to HIGH transition of CP. D-type entry is obtained by interconnecting J and \bar{K} . When J is HIGH and \bar{K} is LOW, the first stage is in the toggle mode. When J is LOW and \bar{K} is HIGH, the first stage is in the hold mode. A LOW on \overline{MR} resets all four bit positions (O₀ = LOW, \overline{O}_3 = HIGH) independent of all other input conditions.
