GENERAL DESCRIPTION

The 74HC/HCT390 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT390 are dual 4-bit decade ripple counters divided into four separately clocked sections. The counters have two divide-by-2 sections and two divide-by-5 sections. These sections are normally used in a BCD

decade or bi-quinary configuration, since they share a common master reset input (nMR). If the two master reset inputs (1MR and 2MR) are used to simultaneously clear all 8 bits of the counter, a number of counting configurations are possible within one package. The separate clocks ($\overline{nCP_0}$ and $\overline{nCP_1}$) of each section allow ripple counter or frequency division applications of divide-by-2, 4, 5, 10, 20, 25, 50 or 100.

Each section is triggered by the HIGH-to-LOW transition of the clock inputs ($\overline{nCP_0}$ and $\overline{nCP_1}$). For BCD decade operation, the nQ₀ output is connected to the $\overline{nCP_1}$ input of, the divide-by-5 section. For bi-quinary decade operation, the nQ₃ output is connected to the $\overline{nCP_0}$ input and nQ₀ becomes the decade output.

The master reset inputs (1MR and 2MR) are active HIGH asynchronous inputs to each decade counter which operates on the portion of the counter identified by the "1" and "2" prefixes in the pin configuration. A HIGH level on the nMR input overrides the clocks and sets the four outputs LOW.

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

			HC	HCT	
t _{PHL} / t _{PLH}	propagation delay n $\overline{CP_0}$ to nQ ₀	C _L = 15 pF; V _{CC} = 5 V	14	18	ns
	n $\overline{CP_1}$ to nQ ₁		15	19	ns
	n $\overline{CP_1}$ to nQ ₂		23	26	ns
	n $\overline{CP_1}$ to nQ ₃		15	19	ns
	nMR to Q _n		16	18	ns

C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per counter	notes 1 and 2	20	21	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is V_I = GND to V_{CC}
For HCT the condition is V_I = GND to V_{CC} -1.5 V
