

CY7C185

8K x 8 Static RAM

Features

- High speed
 - 15 ns
- Fast t_{DOE}
- Low active power
 - 715 mW
- Low standby power
 - 220 mW
- CMOS for optimum speed/power
- Easy memory expansion with \overline{CE}_1 , CE_2 and \overline{OE} features
- TTL-compatible inputs and outputs
- Automatic power-down when deselected

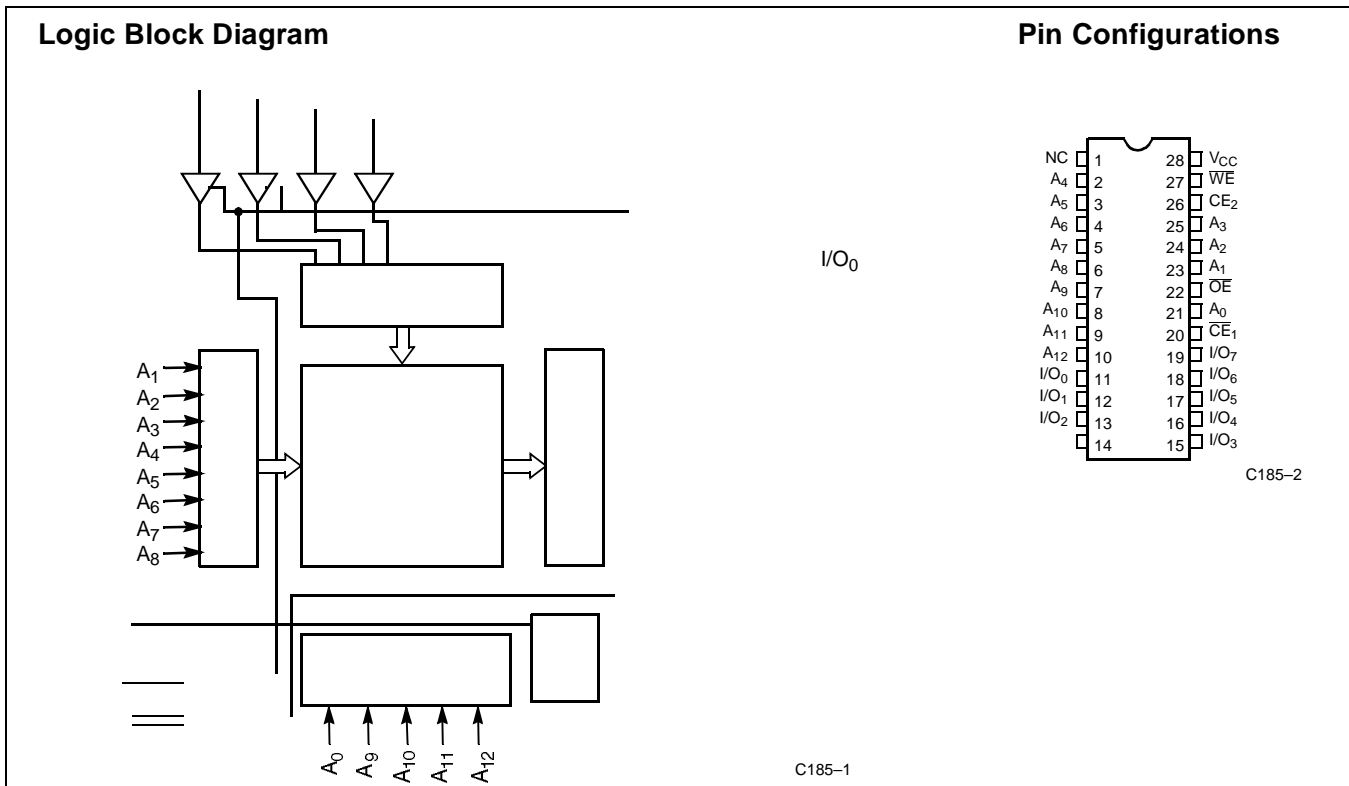

Functional Description

The CY7C185 is a high-performance CMOS static RAM organized as 8192 words by 8 bits. Easy memory expansion is

provided by an active LOW chip enable (\overline{CE}_1), an active HIGH chip enable (CE_2), and active LOW output enable (\overline{OE}) and three-state drivers. This device has an automatic power-down feature (\overline{CE}_1 or CE_2), reducing the power consumption by 70% when deselected. The CY7C185 is in a standard 300-mil-wide DIP and SOJ package.

An active LOW write enable signal (\overline{WE}) controls the writing/reading operation of the memory. When \overline{CE}_1 and \overline{WE} inputs are both LOW and CE_2 is HIGH, data on the eight data input/output pins (I/O_0 through I/O_7) is written into the memory location addressed by the address present on the address pins (A_0 through A_{12}). Reading the device is accomplished by selecting the device and enabling the outputs, \overline{CE}_1 and \overline{OE} active LOW, CE_2 active HIGH, while \overline{WE} remains inactive or HIGH. Under these conditions, the contents of the location addressed by the information on address pins are present on the eight data input/output pins.

The input/output pins remain in a high-impedance state unless the chip is selected, outputs are enabled, and write enable (\overline{WE}) is HIGH. A die coat is used to insure alpha immunity.

Pin Configurations (continued)

C185-3

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature -65°C to +150°C

Ambient Temperature with Power Applied..... -55°C to +125°C

Supply Voltage to Ground Potential -0.5V to +7.0V

DC Voltage Applied to Outputs in High Z State^[2] -0.5V to +7.0V

DC Input Voltage^[2] -0.5V to +7.0V

Output Current into Outputs (LOW)..... 20 mA

Static Discharge Voltage >2001V (per MIL-STD-883, Method 3015)

Latch-Up Current..... >200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0°C to +70°C	5V ± 10%

Electrical Characteristics Over the Operating Range

Parameter	Description	Test Conditions	7C185-12		7C185-15		Unit
			Min.	Max.	Min.	Max.	
V _{OH}	Output HIGH Voltage	V _{CC} = Min., I _{OH} = -4.0 mA	2.4		2.4		V

I _{SB1}	Automatic Power-Down Current	Max. V _{CC} , $\overline{CE}_1 \geq V_{IH}$ or CE ₂ ≤ V _{IL} Min. Duty Cycle=100%	40		40		mA
I _{SB2}	Automatic Power-Down Current	Max. V _{CC} , $\overline{CE}_1 \geq V_{CC} - 0.3V$, or CE ₂ ≤ 0.3V V _{IN} ≥ V _{CC} - 0.3V or V _{IN} ≤ 0.3V	15		15		mA

Shaded areas contain preliminary information.

Notes:

2. Minimum voltage is equal to -3.0V for pulse durations less than 30 ns.
3. -Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.

Shaded areas contain preliminary information.

Notes:

- Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- t_{HZOE}, t_{HZCE}, and t_{HZWE} are specified with C_L = 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady state voltage.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE1} and t_{LZCE2} for any given device.
- The internal write time of the memory is defined by the overlap of \overline{CE}_1 LOW, CE₂ HIGH, and \overline{WE} LOW. All 3 signals must be active to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

Notes:

9. Device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$. $CE_2 = V_{IH}$.
10. \overline{WE} is HIGH for read cycle.
11. Data I/O is High Z if $\overline{OE} = V_{IH}$, $\overline{CE}_1 = V_{IH}$, $\overline{WE} = V_{IL}$ or $CE_2 = V_{IL}$.
12. The internal write time of the memory is defined by the overlap of \overline{CE}_1 LOW, CE_2 HIGH and \overline{WE} LOW. \overline{CE}_1 and \overline{WE} must be LOW and CE_2 must be HIGH to initiate write. A write can be terminated by \overline{CE}_1 or \overline{WE} going HIGH or CE_2 going LOW. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
13. The minimum write cycle time for write cycle #3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .
14. If \overline{CE}_1 goes HIGH or CE_2 goes LOW simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
15. During this period, the I/Os are in the output state and input signals should not be applied.
