

Programmable Quad Supply Monitor with Adjustable Reset and Watchdog Timers

June 2002

FEATURES

- Simultaneously Monitors Four Supplies
- 16 User Selectable Combinations of 5V, 3.3V, 3V, 2.5V, 1.8V, 1.5V and/or \pm Adjustable Voltage Thresholds
- Guaranteed Threshold Accuracy: $\pm 1.5\%$ of Monitored Voltage Over Temperature
- Low Supply Current: 43 μ A Typ
- Adjustable Reset Time
- Adjustable Watchdog Time
- Open-Drain $\overline{\text{RST}}$ Output (LTC2901-1)
- Push-Pull $\overline{\text{RST}}$ Output (LTC2901-2)
- Individual Nondelayed Monitor Output for Each Supply
- Power Supply Glitch Immunity
- Guaranteed $\overline{\text{RST}}$ for $V_{\text{CC}} \geq 1\text{V}$

APPLICATIONS

- Desktop and Notebook Computers
- Multivoltage Systems
- Telecom Equipment
- Portable Battery-Powered Equipment
- Network Servers

DESCRIPTION

The LTC[®]2901 is a programmable supply monitor for systems with up to four supply voltages. One of 16 preset or adjustable voltage monitor combinations can be selected using an external resistor divider connected to the program pin. The preset voltage thresholds are accurate to 1.5% over temperature. All four voltage comparator outputs are connected to separate pins for individual supply monitoring.

The reset and watchdog delay times are adjustable using external capacitors. Tight voltage threshold accuracy and glitch immunity ensure reliable reset operation without false triggering. The $\overline{\text{RST}}$ output is guaranteed to be in the correct state for V_{CC} down to 1V. The LTC2901-1 features an open-drain $\overline{\text{RST}}$ output, while the LTC2901-2 has a push-pull $\overline{\text{RST}}$ output.

The 43 μ A supply current makes the LTC2901 ideal for power conscious systems and it may be configured to monitor less than four inputs. The parts are available in the 16-lead narrow SSOP package.

 LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Quadruple Supply Monitor (5V, 3.3V, 2.5V, 1.8V)

2901 is sn2901

ABSOLUTE MAXIMUM RATINGS

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: All voltage values are with respect to GND.

Note 3: The greater of V_1 , V_2 is the internal supply voltage (V_{CC}).

Note 4: Under static no-fault conditions, V_1 will necessarily supply quiescent current. If at any time V_2 is larger than V_1 , V_2 must be capable of supplying the quiescent current, programming (transient) current and reference load current.

Note 5: The output pins $\overline{\text{RST}}$, $\overline{\text{WDO}}$ and COMPX have internal pull-ups to V_2 of typically $6\mu\text{A}$. However, external pull-up resistors may be used when faster rise times are required or for V_{OH} voltages greater than V_2 .

Note 6: The push-pull $\overline{\text{RST}}$ output pin on the LTC2901-2 is *actively* pulled up to V_2 .

PIN FUNCTIONS

COMP3 (Pin 1): Comparator Output 3. Nondelayed, active high logic output with weak pull-up to V2. Pulls high when V3 is above reset threshold. May be pulled greater than V2 using external pull-up.

COMP1 (Pin 2): Comparator Output 1. Nondelayed, active high logic output with weak pull-up to V2. Pulls high when V1 is above reset threshold. May be pulled greater than V2 using external pull-up.

V3 (Pin 3): Voltage Input 3. Select from 2.5V, 1.8V, 1.5V or ADJ. See Table 1 for details.

V1 (Pin 4): Voltage Input 1. Select from 5V or 3.3V. See Table 1 for details. The greater of (V1, V2) is also V_{CC} for the chip. Bypass this pin to ground with a 0.1 μ F (or greater) capacitor.

CRT (Pin 5): Reset Delay Time Programming Pin. Attach an external capacitor (C_{RT}) to GND to set a reset delay time of 4.6ms/nF. Leaving the pin open generates a minimum delay of approximately 50 μ s. A 47nF capacitor will generate a 216ms reset delay time.

RST (Pin 6): Reset Logic Output. Active low with weak pull-up to V2 (LTC2901-1) or active pull-up to V2 (LTC2901-2). Pulls low when any voltage input is below the reset threshold and held low for programmed delay time after all voltage inputs are above threshold. May be pulled above V2 using an external pull-up (LTC2901-1 only).

WDO (Pin 7): Watchdog Output. Active low logic output with weak pull-up to V2. May be pulled greater than V2 using external pull-up. The watchdog output pulls low if the watchdog timer is allowed to time out and remains low until set high by the next WDI transition or anytime RST is low. The watchdog timer is enabled when RST is high.

WDI (Pin 8): Watchdog Input. A logic input whose rising or falling edge must occur on this pin (while RST is high) within the selected watchdog time-out period, prohibiting a high-to-low transition on the WDO pin. The watchdog time-out period is set by the value of the capacitor that is attached to the CWT pin. A rising or falling edge on the WDI pin clears the voltage on the C_{WT} capacitor, preventing WDO from going low. When disabling the watchdog function, tie CWT to GND.

CWT (Pin 9): Watchdog Time-Out Programming Pin. Attach a capacitor (C_{WT}) between CWT and GND to set a watchdog time-out period of 20ms/nF. Leaving the pin open generates a minimum time-out of approximately 200 μ s. A 47nF capacitor will generate a 940ms watchdog time-out period.

GND (Pin 10): Ground.

V_{PG} (Pin 11): Voltage Threshold Combination Select Input. Connect to an external 1% resistive divider between V_{REF} and GND to select 1 of 16 combinations of preset and/or \pm adjustable voltage thresholds (see Table 1). Do not add capacitance on the V_{PG} pin.

V_{REF} (Pin 12): Buffered Reference Voltage. A 1.210V nominal reference used for programming voltage (V_{PG}) and for the offset of negative adjustable applications. The buffered reference can source and sink up to 1mA. The reference can drive a bypass capacitor of up to 1000pF without oscillation.

V4 (Pin 13): Voltage Input 4. Select from 1.8V, 1.5V, ADJ or -ADJ. See Table 1 for details.

V2 (Pin 14): Voltage Input 2. Select from 3.3V, 3V or 2.5V. See Table 1 for details. The greater of (V1, V2) is also V_{CC} for chip. Bypass this pin to ground with a 0.1 μ F (or greater) capacitor. All logic outputs (COMP1, COMP2, COMP3, COMP4, RST, WDO) are weakly pulled up to V2 (LTC2901-1). RST is actively pulled up to V2 in the LTC2901-2.

COMP4 (Pin 15): Comparator Output 4. Nondelayed, active high logic output with weak pull-up to V2. Pulls high when V4 is above reset threshold. May be pulled greater than V2 using external pull-up.

COMP2 (Pin 16): Comparator Output 2. Nondelayed, active high logic output with weak pull-up to V2. Pulls high when V2 is above reset threshold. May be pulled greater than V2 using external pull-up.

BLOCK DIAGRAM

APPLICATIONS INFORMATION

Power-Up

The greater of V1, V2 is the internal supply voltage (V_{CC}). On power-up, V_{CC} will power the drive circuits for the \overline{RST} and the COMPX pins. This ensures that the \overline{RST} and COMPX outputs will be low as soon as V1 or V2 reaches 1V. The \overline{RST} and COMPX outputs will remain low until the part is programmed. After programming, if any one of the V_X inputs is below its programmed threshold, \overline{RST} will be a logic low. Once all the V_X inputs rise above their thresholds, an internal timer is started and \overline{RST} is released after the programmed delay time. If $V_{CC} < (V3 - 1)$ and $V_{CC} < 2.4V$, the V3 input impedance will be low ($1k\Omega$ typ).

Monitor Programming

The LTC2901 input voltage combination is selected by placing the recommended resistive divider from V_{REF} to GND and connecting the tap point to V_{PG} , as shown in Figure 4. Table 1 offers recommended 1% resistor values for the various modes. The last column in Table 1 specifies optimum V_{PG}/V_{REF} ratios (± 0.01) to be used when programming with a ratiometric DAC.

During power-up, once V1 or V2 reaches 2.4V max, the monitor enters a programming period of approximately

Table 1. Voltage Threshold Programming

Figure 4. Monitor Programming

150 μ s during which the voltage on the V_{PG} pin is sampled and the monitor is configured to the desired input combination. Do not add capacitance to the V_{PG} pin. Immediately after programming, the comparators are enabled and supply monitoring will begin.

Supply Monitoring

The LTC2901 is a low power, high accuracy programmable quad supply monitoring circuit with four nondelayed monitor outputs, a common reset output and a watchdog timer. Watchdog and reset timing are both adjustable using external capacitors. Single pin programming selects 1 of 16 input voltage monitor combinations. All four voltage inputs must be above predetermined thresholds for the reset not to be invoked. The LTC2901 will assert the reset and comparator outputs during power-up, power-down and brownout conditions on any one of the voltage inputs.

The inverting inputs on the V3 and/or V4 comparators are set to 0.5V when the positive adjustable modes are selected (Figure 5). The tap point on an external resistive divider, connected between the positive voltage being sensed and ground, is connected to the high impedance noninverting inputs (V3, V4). The trip voltage is calculated from:

$$V_{TRIP} = 0.5V \left(1 + \frac{R3}{R4} \right)$$

In the negative adjustable mode, the noninverting input on the V4 comparator is connected to ground (Figure 6). The tap point on an external resistive divider, connected between the negative voltage being sensed and the V_{REF} pin, is connected to the high impedance inverting input (V4). V_{REF} provides the necessary level shift required to operate at ground. The trip voltage is calculated from:

$$V_{TRIP} = -V_{REF} \left(\frac{R3}{R4} \right); V_{REF} = 1.210V \text{ Nominal}$$

APPLICATIONS INFORMATION

Figure 5. Setting the Positive Adjustable Trip Point

Figure 6. Setting the Negative Adjustable Trip Point

In a negative adjustable application, the minimum value for R4 is limited by the sourcing capability of V_{REF} (± 1 mA). With no other load on V_{REF} , R4 (minimum) is:

$$1.21\text{V} \div 1\text{mA} = 1.21\text{k}\Omega.$$

Tables 2 and 3 offer suggested 1% resistor values for various adjustable applications.

Although all four supply monitor comparators have built-in glitch immunity, bypass capacitors on V1 and V2 are recommended because the greater of V1 or V2 is also the V_{CC} for the chip. Filter capacitors on the V3 and V4 inputs are allowed.

Power-Down

On power-down, once any of the V_X inputs drop below their threshold, $\overline{\text{RST}}$ and $\overline{\text{COMPX}}$ are held at a logic low. A logic low of 0.4V is guaranteed until both V1 and V2 drop below 1V. If the bandgap reference becomes invalid ($V_{CC} < 2\text{V}$ typ), the part will reprogram once V_{CC} rises above 2.4V max.

Table 2. Suggested 1% Resistor Values for the ADJ Inputs

V_{SUPPLY} (V)	V_{TRIP} (V)	R3 (k Ω)	R4 (k Ω)

-10	-9.31	931	121
-12	-11.30	1130	121

Monitor Output Rise and Fall Time Estimation

All of the outputs ($\overline{\text{RST}}$, $\overline{\text{COMPX}}$, $\overline{\text{WDO}}$) have strong pull-down capability. If the external load capacitance (C_{LOAD}) for a particular output is known, output fall time (10% to 90%) is estimated using:

$$t_{\text{FALL}} \approx 2.2 \cdot R_{\text{PD}} \cdot C_{\text{LOAD}}$$

where R_{PD} is the on-resistance of the internal pull-down transistor. The typical performance curve (V_{OL} vs I_{SINK}) demonstrates that the pull-down current is somewhat linear versus output voltage. Using the 25°C curve, R_{PD} is estimated to be approximately 40 Ω . Assuming a 150pF load capacitance, the fall time is about 13.2ns.

Although the outputs are considered to be “open-drain,” they do have a weak pull-up capability (see $\overline{\text{COMPX}}$ or $\overline{\text{RST}}$

APPLICATIONS INFORMATION

Pull-Up Current vs V2 curve). Output rise time (10% to 90%) is estimated using:

$$t_{RISE} \approx 2.2 \cdot R_{PU} \cdot C_{LOAD}$$

where R_{PU} is the on-resistance of the pull-up transistor. The on-resistance as a function of the V2 voltage at room temperature is estimated using:

$$R_{PU} = \frac{6 \cdot 10^5}{V2 - 1} \Omega$$

with $V2 = 3.3V$, R_{PU} is about 260k. Using 150pF for load capacitance, the rise time is 86 μ s. If the output needs to pull up faster and/or to a higher voltage, a smaller external pull-up resistor may be used. Using a 10k pull-up resistor, the rise time is reduced to 3.3 μ s for a 150pF load capacitance.

The LTC2901-2 has an active pull-up to V2 on the \overline{RST} output. The typical performance curve (\overline{RST} Pull-Up Current vs V2 curve) demonstrates that the pull-up current is somewhat linear versus the V2 voltage and R_{PU} is estimated to be approximately 625 Ω . A 150pF load capacitance makes the rise time about 206ns.

Watchdog Timer

The watchdog circuit typically monitors a μ P's activity. The μ P is required to change the logic state of the WDI pin on a periodic basis in order to clear the watchdog timer and prevent the \overline{WDO} pin from going low. Whenever \overline{RST} is low, the watchdog timer is cleared and \overline{WDO} is set high. The watchdog timer is started when \overline{RST} pulls high. Subsequent edges received on the WDI pin will clear the watchdog timer. The timer will continue to run until the watchdog timer times out. Once the watchdog timer times out, internal circuitry will bring the \overline{WDO} pin low. \overline{WDO} will remain low and the watchdog timer will remain cleared until the next edge is received on the WDI pin or until \overline{RST} goes low.

To disable the watchdog timer, simply ground the CWT pin (Pin 9). With CWT held at ground, any reset event will force \overline{WDO} high indefinitely. It is safe to leave the WDI pin (Pin 8) unconnected because the weak internal pull-up (10 μ A typ) will pull WDI high. Tying WDI to V1 or ground is also allowed, but grounding the WDI pin will force the pull-up current to be drawn continuously.

Selecting the Reset Timing Capacitor

The reset time-out period is adjustable in order to accommodate a variety of microprocessor applications. The reset time-out period, t_{RST} , is adjusted by connecting a capacitor, C_{RT} , between the CRT pin and ground. The value of this capacitor is determined by:

$$C_{RT} = t_{RST} \cdot 217.4 \cdot 10^{-9}$$

with C_{RT} in Farads and t_{RST} in seconds. The C_{RT} value per millisecond of delay can also be expressed as $C_{RT/ms} = 217.4$ (pF/ms).

Leaving the CRT pin unconnected will generate a minimum reset time-out of approximately 50 μ s. Maximum reset time-out is limited by the largest available low leakage capacitor. The accuracy of the time-out period will be affected by capacitor leakage (the nominal charging current is 2 μ A) and capacitor tolerance. A low leakage ceramic capacitor is recommended.

Selecting the Watchdog Timing Capacitor

The watchdog time-out period is adjustable and can be optimized for software execution. The watchdog time-out period, t_{WD} , is adjusted by connecting a capacitor, C_{WT} , between the CWT pin and ground. Given a specified watchdog time-out period, the capacitor is determined by:

$$C_{WT} = t_{WD} \cdot 50 \cdot 10^{-9}$$

with C_{WT} in Farads and t_{WD} in seconds. The C_{WT} value per millisecond of delay can also be expressed as $C_{WT/ms} = 50$ (pF/ms).

Leaving the CWT pin unconnected will generate a minimum watchdog time-out of approximately 200 μ s. Maximum time-out is limited by the largest available low leakage capacitor. The accuracy of the time-out period will be affected by capacitor leakage (the nominal charging current is 2 μ A) and capacitor tolerance. A low leakage ceramic capacitor is recommended.

Monitoring Power Supply Controller Activity

Figure 7 demonstrates how the LTC2901 can be used to monitor switcher activity. The monitor is configured to supervise 3.3V, 2.5V, 1.8V and one adjustable input.

APPLICATIONS INFORMATION

Because 2.5V does not exist in this application, the V2 input is tied to the V1 (3.3V) input. The feedback voltage on the LTC1772 (0.8V typ) is monitored with the adjustable input (V4). The RST pin will go high 216ms ($C_{RT} = 47nF$) after the 3.3V and 1.8V supplies and the feedback voltage are above threshold. Individual input status is available at the COMPX pins.

While the voltage monitors can detect low voltage or shorted inputs, the watchdog circuit can be used to detect an open circuit to the primary load. With the CWT pin

unconnected, the watchdog time-out is approximately 200 μ s. At low load currents on the 1.8V supply, the LTC1772 will go into Burst Mode[®] operation. With an open-circuit load, the duty cycle at the gate of M1 will drop, and the pulse spacing will exceed the watchdog time-out period. The WDO pin will go low indicating the low load condition. The WDO pin will return high on the next pulse to the gate of M1. The WDO pin will remain high if the load is restored.

Burst Mode is a registered trademark of Linear Technology Corporation.

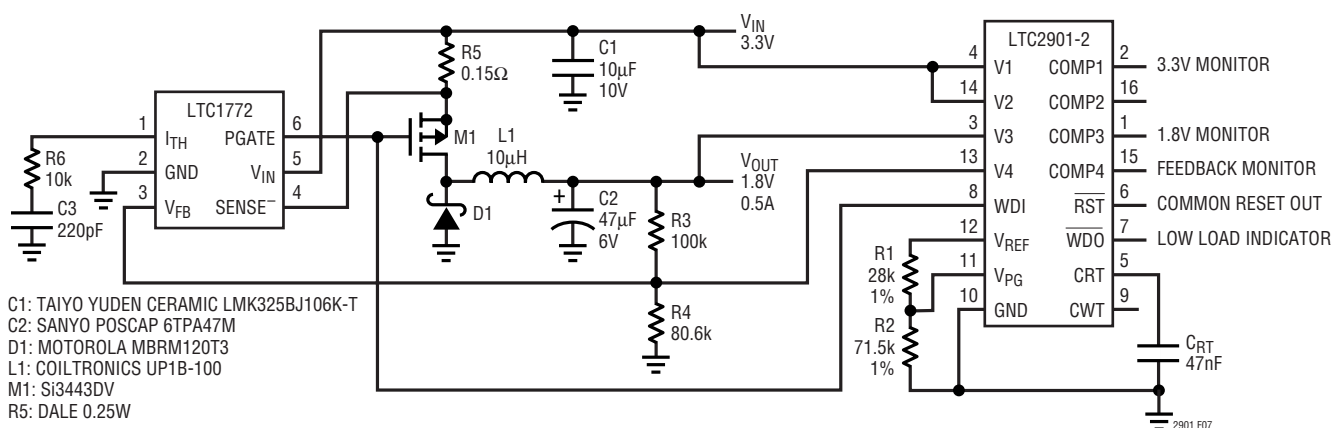

Figure 7. Monitor Input, Output, Feedback Voltage and Low Load Conditions on DC/DC Controller

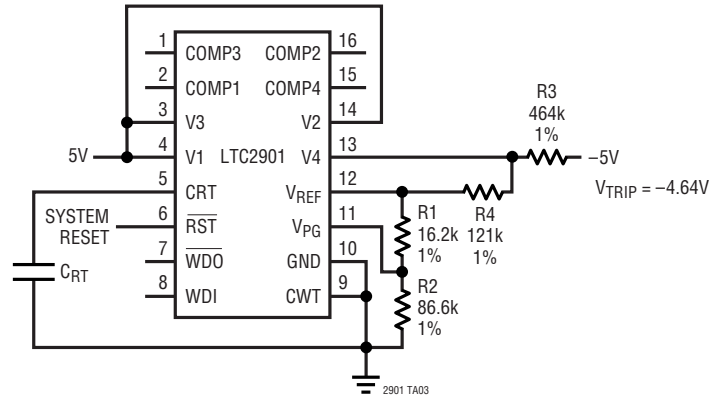

TYPICAL APPLICATIONS

Quad Supply Monitor with Watchdog Timer Disabled 5V, 3V, 1.8V, 12V (ADJ)

TYPICAL APPLICATIONS

**5V, -5V Monitor with Watchdog Timer Disabled and Unused
V2, V3 Inputs Pulled Above Trip Thresholds**

**Quad Supply Monitor with LED Undervoltage Indicators
5V, 3.3V, 2.5V, 1.5V**

PACKAGE DESCRIPTION

GN Package
16-Lead Plastic SSOP (Narrow .150 Inch)
 (Reference LTC DWG # 05-08-1641)

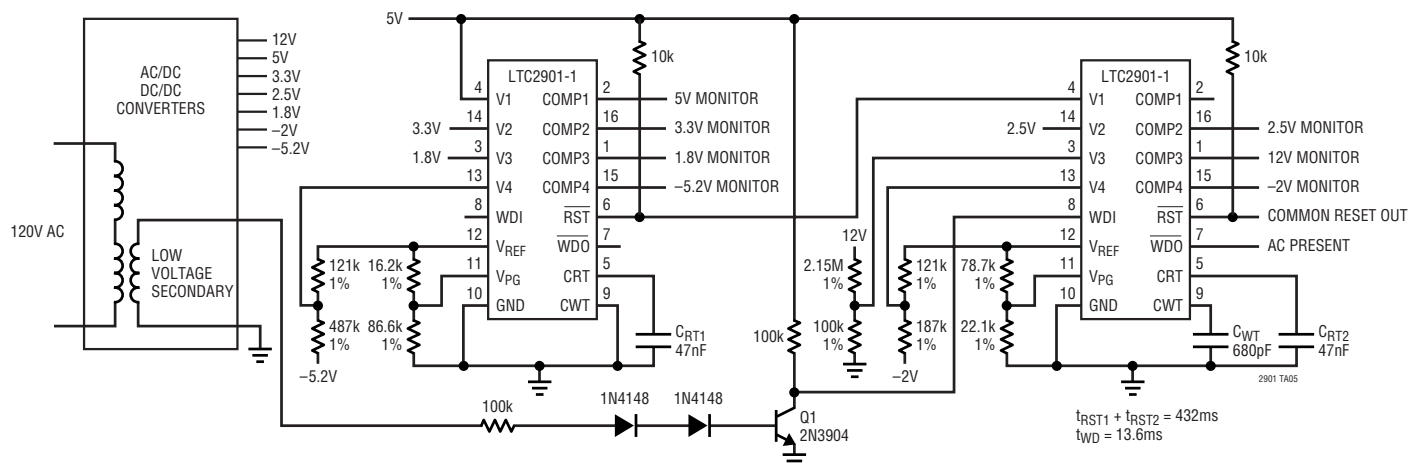

* DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE
 ** DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

GN16 (SSOP) 1098

TYPICAL APPLICATION

Monitor Seven Supplies (12V, 5V, 3.3V, 2.5V, 1.8V, -2V, -5.2V) with Sequenced Reset and AC Present Indication

RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
LTC690	5V Supply Monitor, Watchdog Timer and Battery Backup	4.65V Threshold
