Product Description

The AP561 is a high dynamic range broadband power amplifier in a surface mount package. The single-stage amplifier has 13 dB Gain, while being able to achieve high performance for 0.7–2.9 GHz applications with up to +39 dBm of compressed 1dB power.

The AP561 uses a high reliability +12V InGaP/GaAs HBT process technology. The device incorporates proprietary bias circuitry to compensate for variations in linearity and current draw over temperature. The device does not require any negative bias voltage; an internal active bias allows the AP561 to operate directly off a commonly used +12V supply and has the added feature of a +5V power down control pin. RoHS-compliant 5x6mm DFN package is surface mountable to allow for low manufacturing costs to the end user.

The AP561 is targeted for use in a balanced or single ended configuration for WiMAX or WiBro applications where high linearity and high power is required.

Application Circuit PC Board Layout

Circuit Board Material: 0.0147" Rogers Ultralam 2000, single layer, 1 oz copper, $\epsilon_r = 2.45$, Microstrip line details: width = .043", spacing = .050"

Baseplate Configuration

Notes:

1. Please note that for reliable operation, the evaluation board will have to be mounted to a much larger heat sink during operation and in laboratory environments to dissipate the power consumed by the device. The use of a convection fan is also recommended in laboratory environments.
2. The area around the module underneath the PCB should not contain any soldermask in order to maintain good RF grounding.
3. For proper and safe operation in the laboratory, the power-on sequencing is recommended.

Evaluation Board Bias Procedure

Following bias procedure is recommended to ensure proper functionality of AP561 in a laboratory environment. The sequencing is not required in the final system application.

Vpd	+5

Turn-on Sequence:

1. Attach input and output loads onto the evaluation board.
2. Turn on power supply Vcc = +12V.
3. Turn on power supply Vpd = +5V.
4. Turn on RF power.

Typical Device Data

S-Parameters ($V_{CC} = +12\text{ V}$, $I_{CC} = 300\text{ mA}$, $25\text{ }^\circ\text{C}$, unmatched 50 ohm system)

Notes:

The gain for the unmatched device in 50 ohm system is shown as the trace in black color. For a tuned circuit for a particular frequency, it is expected that actual gain will be higher, up to the maximum stable gain. The maximum stable gain is shown in the red line.

2.3-2.9 GHz Application Circuit Performance Plots

802.16-2004 O-FDMA, 64QAM-1/2, 1024-FFT, 20 symbols and 30 subchannels. 9.5 dB PAR @ 0.01%, 5 MHz Carrier BW

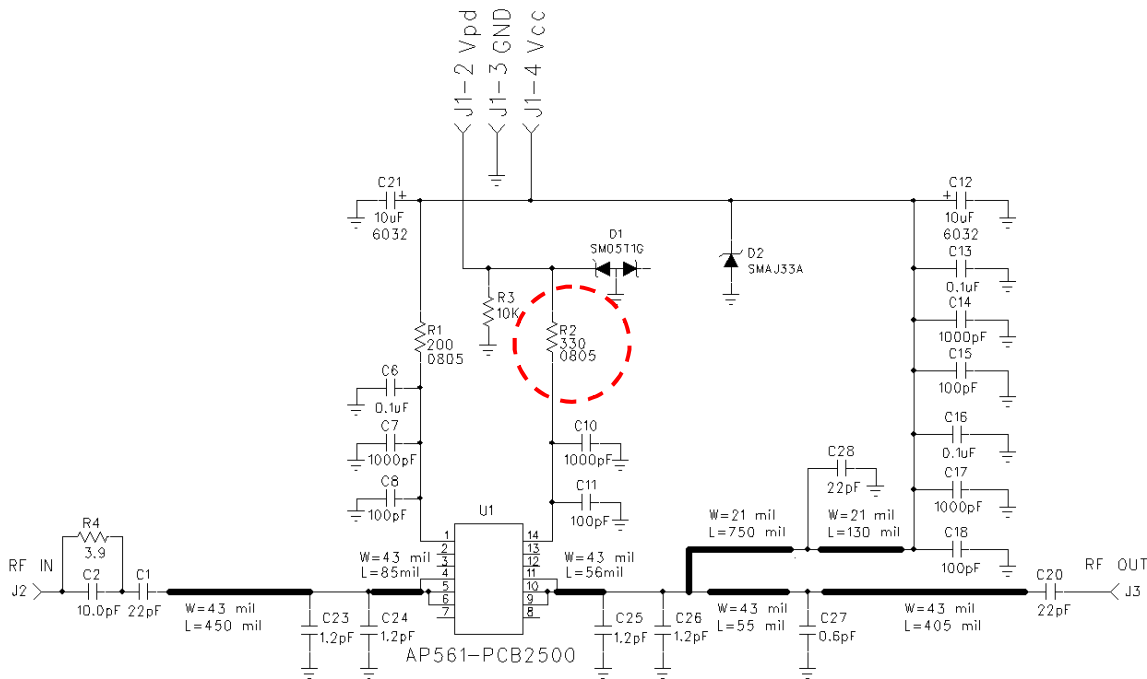

2.5 – 2.7 GHz Application Note: Changing Icq Biasing Configurations

The AP561 can be configured to operate with lower bias current by varying the bias-adjust resistor R2. (Table 1) The recommended circuit configurations shown previously in this datasheet have the device operating with a 300 mA as the quiescent current (I_{CQ}). This biasing level represents a tradeoff in terms of EVM and efficiency. Lowering I_{CQ} will improve upon the efficiency of the device, but degrade the EVM performance. Measured data shown in the plots below represents the AP561-PCB2500 measured and configured for 2.6GHz applications. It is expected that variation of the bias current for other frequency applications will produce similar performance results.

Table 1 : Reduced Current Operation

I _{cq} (mA)	R ₂ (Ω)	V _{PD} (V)	I _{REF} (V)
300	330	5	2.85
280	336	5	2.81
260	240	5	2.78
240	343	5	2.76
220	348	5	2.73
200	351	5	2.71

Mounting Configuration / Land Pattern

- NOTES:**
- GROUND/THERMAL VIAS ARE CRITICAL FOR THE PROPER PERFORMANCE OF THIS DEVICE. VIAS SHOULD USE A .35mm (#00/0135") DIAMETER DRILL AND HAVE A FINAL PLATED THRU DIAMETER OF .25mm (.010").
 - ADD AS MUCH COPPER AS POSSIBLE TO INNER AND OUTER LAYERS NEAR THE PART TO ENSURE OPTIMAL THERMAL PERFORMANCE.
 - TO ENSURE RELIABLE OPERATION, DEVICE GROUND PADDLE-TO-GROUND PAD SOLDER JOINT IS CRITICAL.
 - ADD MOUNTING SCREWS NEAR THE PART TO FASTEN THE BOARD TO A HEATSINK. ENSURE THAT THE GROUND/THERMAL VIA REGION CONTACTS THE HEATSINK.
 - DO NOT PUT SOLDER MASK ON THE BACK SIDE OF THE PCB BOARD IN THE REGION WHERE THE BOARD CONTACTS THE HEATSINK.
 - RF TRACE WIDTH DEPENDS UPON THE PCB BOARD MATERIAL AND CONSTRUCTION.
 - USE 1 OZ. COPPER MINIMUM.
 - ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
 - A HEATSINK UNDERNEATH THE AREA OF THE PCB FOR THE MOUNTED DEVICE IS STRICTLY REQUIRED FOR PROPER THERMAL OPERATION. DAMAGE TO THE DEVICE CAN OCCUR WITHOUT THE USE OF ONE.
