8-stage shift-and-store bus register

HEF4094B MSI

DESCRIPTION

The HEF4094B is an 8-stage serial shift register having a storage latch associated with each stage for strobing data from the serial input to parallel buffered 3-state outputs O_0 to O_7 . The parallel outputs may be connected directly to common bus lines. Data is shifted on positive-going clock transitions. The data in each shift register stage is transferred to the storage register when the strobe (STR) input is HIGH. Data in the storage register appears at the outputs whenever the output enable (EO) signal is HIGH.

Two serial outputs (O_s and O'_s) are available for cascading a number of HEF4094B devices. Data is available at O_s on positive-going clock edges to allow high-speed operation in cascaded systems in which the clock rise time is fast. The same serial information is available at O'_s on the next negative-going clock edge and provides cascading HEF4094B devices when the clock rise time is slow.

FUNCTION TABLE

INPUTS				PARALLEL OUTPUTS		SERIAL OUTPUTS	
CP	EO	STR	D	O ₀	O _n	O _s	O' _s
↗	L	X	X	Z	Z	O' ₆	nc
↘	L	X	X	Z	Z	nc	O ₇
↗	H	L	X	nc	nc	O' ₆	nc
↗	H	H	L	L	O _{n-1}	O' ₆	nc
↗	H	H	H	H	O _{n-1}	O' ₆	nc
↘	H	H	H	nc	nc	nc	O ₇

Notes

1. H = HIGH state (the more positive voltage)
2. L = LOW state (the less positive voltage)
3. X = state is immaterial
4. ↗ = positive-going transition
5. ↘ = negative-going transition
6. Z = high impedance off state
7. nc = no change
8. O'₆ = the information in the seventh shift register stage

At the positive clock edge the information in the 7th register stage is transferred to the 8th register stage and the O_s output.
