

DATA SHEET

TEA6823T; TEA6825T In Car Entertainment (ICE) car radio

Preliminary specification
File under Integrated Circuits, IC01

1998 Mar 24

In Car Entertainment (ICE) car radio

TEA6823T; TEA6825T

FEATURES

General

- FM mixer for conversion from FM-IF₁ = 72.2 MHz to FM-IF₂ = 10.7 MHz
- AM mixer for conversion from AM-IF₁ = 10.7 MHz to AM-IF₂ = 450 kHz
- FM-IF gain stage
- Crystal oscillator providing mixer frequencies and references for IF-count and stereo decoder
- FM quadrature demodulator with automatic centre frequency adjustment and THD compensation
- Level, multi-path and noise detectors
- Soft mute
- Stereo noise cancelling and variable de-emphasis
- PLL stereo decoder
- Noise blanker
- AM IF-amplifier and demodulator
- I²C-bus transceiver with interface to enable direct data transfer to radio front-end
- IF-count for AM and FM
- Reference frequency generation for PLL synthesizer.

Stereo decoder

- Adjustment-free PLL VCO
- Pilot depending mono/stereo switching
- Analog control of mono/stereo blend
- Adjacent channel noise suppression (114 kHz)
- Pilot cancelled
- Analog control of de-emphasis
- Integrated low-pass filters for 190 kHz adjacent channel interferences and signal delay for interference absorption circuit.

GENERAL DESCRIPTION

The TEA6823T together with the TEA6811T and the TEA6825T together with the TEA6810T form an AM/FM electronic tuned car radio in a double conversion receiver concept.

ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
TEA6823T	VSO56	plastic very small outline package; 56 leads	SOT190-1
TEA6825T	VSO56	plastic very small outline package; 56 leads; face down	SOT190-2

SYMBOL	PIN	DESCRIPTION
FMIFAMPOUT	29	FM-IF amplifier output
AFGND	30	AF ground
DEEMPHR	31	de-emphasis capacitor right
DEEMPHL	32	de-emphasis capacitor left
AMIF2IN1	33	AM-IF ₂ input 1
AMIF2IN2	34	AM-IF ₂ input 2
FMIN2	35	FM limiter input
DCFEED	36	DC feed FM limiter
FMIN1	37	FM limiter input
LEVELADJ	38	level adjustment input
C _{AFC}	39	AFC capacitor
MPBUF	40	multi-path buffer time constant
OUTLEFT	41	AF output left
FMSTOP	42	FMSTOP adjustment input
RDS/AMSTOP	43	MPX for RDS/AMSTOP adjustment input
OUTRIGHT	44	AF output right
MPXIN	45	stereo decoder MPX input
THRES	46	threshold
MPXOUT	47	FM demodulator MPX output
AMAFOUT	48	AM demodulator AF output
V _{mute/AML}	49	mute voltage/AM level
LEVELUNWEIG	50	unweighted level output
IAC _{CONTR}	51	IAC control voltage
V _{DDD}	52	digital supply voltage
SDA	53	serial data input/output; pull-up to +5 V
SCL	54	serial clock input; pull-up to +5 V
DGND	55	digital ground
V _{DDA3}	56	analog supply voltage 3 (+8.5 V)

In Car Entertainment (ICE) car radio

TEA6823T; TEA6825T

FUNCTIONAL DESCRIPTION

Stereo decoder

By changing the value of the input resistor at pin 12 the MPX input can be adapted to the level of the FM demodulator output (see Fig.16).

A 3rd order low-pass filter ($f_g = 90$ kHz) at the MPX input provides an extra 190 kHz ACI suppression.

An interference gate is connected at the MPX demodulator outputs. For AM the VCO is switched off.

In Car Entertainment (ICE) car radio

TEA6823T; TEA6825T

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V _{DDA1}	analog supply voltage 1 (pin 5)		-0.3	+6.5	V
V _{DDA2}	analog supply voltage 2 (pin 28)		-0.3	+12	V
V _{DDA3}	analog supply voltage 3 (pin 56)		-0.3	+12	V
V _{DDD}	digital supply voltage (pin 52)		-0.3	+6.5	V
T _{stg}	storage temperature		-55	+150	°C
T _{amb}	operating ambient temperature		-40	+85	°C
V _{es}	electrostatic handling	note 1			
	pins 8 and 9		-100	+100	V
	all other pins		-300	+300	V

Note

- Charge device model class B: equivalent to discharging a 200 pF capacitor via a 0 Ω series resistor.

CHARACTERISTICS

V₅₆₋₄ = V₂₈₋₄ = 8.5 V; V₅₋₄ = V₅₂₋₅₅ = 5 V; T_{amb} = 25 °C; f_{mod} = 1 kHz; deviation = 22.5 kHz; R_g = 50 Ω; V₃₇₋₃₅ = 10 mV; with de-emphasis = 50 μs; coil quality = 15; unless otherwise specified.

Notes to the characteristics

- For typical adjusting range see Figs 10 and 13.
- For typical curve see Fig.11.
- The static mute voltage follows the unweighted voltage level as function of FM-IF₂ voltage and level adjustment voltage V_{38-4} . It additionally depends on multi-path level, noise (adjacent channel interferences) and the position of TSWITCH (pin 3). For typical curve for mute voltage dependence see Fig.12.
- The mono/stereo blend voltage is generated as a function of FM-IF₂ voltage, multi-path level, noise and position of TSWITCH.
- The high-cut control voltage is generated as a function of FM-IF₂ voltage, multi-path level, noise and position of TSWITCH.
- $f_{IF1} = 10.7 \text{ MHz}$; $f_{IF2} = 450 \text{ kHz}$ for AM mixer.
- The AM oscillator signal is generated by division of the 61.5 MHz crystal oscillator. Two divider ratios programmable by the I²C-bus: divide by 6 (AM-IF₁ = 10.7 MHz); divide by 2 (AM-IF₁ = 30 MHz).
- For typical AM level curve see Fig.15.
- For AM detector; $f_{AMIF2} = 450 \text{ kHz}$; $f_{\text{mod}} = 400 \text{ Hz}$; $m = 30\%$.

Notes to the stereo decoder characteristics

1. The following equations give the values for the carrier and harmonic suppression at the output:

$$\alpha_{2^7} = \frac{V_0(\text{signal}) (\text{at } 1 \text{ kHz})}{V_0(\text{spurious}) (\text{at } 1 \text{ kHz})} f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_{3^3} = \frac{V_0(\text{signal}) (\text{at } 1 \text{ kHz})}{V_0(\text{spurious}) (\text{at } 1 \text{ kHz})} f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

$$\alpha_{57} (\text{ARI}) = \frac{V_0(\text{signal}) (\text{at } 1 \text{ kHz})}{V_0(\text{spurious}) (\text{at } 1 \text{ kHz} \pm 23 \text{ Hz})}$$

$$\alpha_{67} = \frac{V_0(\text{signal}) (\text{at } 1 \text{ kHz})}{V_0(\text{spurious}) (\text{at } 9 \text{ kHz})} f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

$$\alpha_{114} = \frac{V_0(\text{signal}) (\text{at } 1 \text{ kHz})}{V_0(\text{spurious}) (\text{at } 4 \text{ kHz})} f_s = 110 \text{ kHz} - (3 \times 38 \text{ kHz})$$

$$\alpha_{190} = \frac{V_0(\text{signal}) (\text{at } 1 \text{ kHz})}{V_0(\text{spurious}) (\text{at } 4 \text{ kHz})} f_s = 186 \text{ kHz} - (5 \times 38 \text{ kHz})$$

2. The stereo decoder can be set to mono via the I²C-bus. Pilot presence indication via the I²C-bus.
3. The nominal de-emphasis value can be changed to 75 μs with C₃₁; C₃₂ = 10 nF.
4. The VCO is adjusted by means of a digital auxiliary PLL.
5. Noise blanker does not trigger.
6. Noise blanker triggers.

I²C-BUS AND I²C-BUS CONTROLLED FUNCTIONS**I²C-bus specification**

The standard I²C-bus specification is expanded by the following definitions.

Structure of the I²C-bus logic: slave transceiver with auto increment and expansion to switch a direct transfer of all transmissions to an output for the radio front-end IC (TEA6810T respectively TEA6811T).

Subaddresses are not used.

DATA TRANSFER FOR THE TEA6823T AND THE TEA6825T

Data sequence:

- Address
- Byte 1
- Byte 2.

The data transfer may be in this order only. The transfer direction of the data bytes is defined by the LSB of the address.

The data becomes valid at the output of the internal latches with the acknowledge of each byte. A STOP condition after any byte can shorten transmission times.

When writing to the transceiver by using the STOP condition before completion of the whole transfer:

- The remaining bytes will contain the old information
- If the transfer of a byte was not completed, this byte is lost and the previous information is available.

DATA TRANSFER TO AN OUTPUT OF THE FRONT-END IC

A data bit in the transceiver of the TEA6823T or TEA6825T enables or disables a direct transfer of all transmissions to an interface stage for the front-end IC.

For a transmission to the front-end IC the address and the data format of the front-end IC has to be used.

Remark: the pull-up resistors for the front-end interface (pins 6 and 7) should not be connected to the 5 V supply voltage of the front-end IC, otherwise a bus pull-down (pin 53) can occur during switching off the front-end supply when the interface stage is enabled.

DATA TRANSFER TO THE IF IC

Data transfer to the IF IC (TEA6823T or TEA6825T) is independent of the state of interface stage for the front-end IC.

Table 1 Structure of the I²C-bus

DESCRIPTION	SPECIFICATION
Bus address of the TEA6823T and the TEA6825T	1100001X
Subaddress	not used
Hardware (pin) programmable address bits	not available
Default settings by power-on reset	data byte 1 bits 4 to 7 are set to logic 0; all other bits are random

Table 8 Output signal of reference frequency divider

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
$V_{10-11(p-p)}$	differential output voltage (peak-to-peak value)	0.3	0.4	0.5	V
$V_{10-4(p-p)}$; $V_{11-4(p-p)}$	single-ended output voltage (peak-to-peak value)	0.15	0.2	0.3	V
C_{10-4} ; C_{11-4}	output capacitance	–	–	4	pF
R_{10-52} ; R_{11-52}	output resistance	800	1000	1200	Ω

IF-COUNTER

Table 9 IF-counter sensitivity

SYMBOL	PARAMETER	CONDITIONS	MIN.	UNIT
V_{33-34}	IF-counter sensitivity	AM mode; $m = 0$	200	μV
V_{37-35}	IF-counter sensitivity	FM mode	200	μV

AM counting windows are 4 or 40 ms. FM counting windows are 4 or 40 ms. AM counting resolution is 250 or 25 Hz. FM counting resolution is 5 kHz, 625 Hz, 50 kHz or 6.25 kHz. AM-IF-prescaler is divisible by 1. FM-IF-prescaler is divisible by 25 or 200.

In Car Entertainment (ICE) car radio

TEA6823T; TEA6825T

*IF-counter read out***IF-counter read out as a function of FM or AM position, counter window and prescaler setting**

FM/AM	PRESCALER RATIO	WINDOW (ms)	f _{IF} (kHz)	READ OUT	RESOLUTION (Hz/count)	RANGE (kHz)	
						MIN.	MAX.
FM	200	4	10700	D6H	50000	4300	17050
FM	200	40	10700	5CH	5000	10065	11335
FM	25	4	10700	B0H	6250	9906.25	11493.75
FM ⁽¹⁾	25	40	10700	E0H	625	10620.63	10779.38
AM	1	4	450	08H	250	418.25	481.75
AM ⁽¹⁾	1	40	450	50H	25	446.83	453.18

Note

1. In position FM with a prescaler ratio of 25, counter window of 40 ms and in position AM with 40 ms counter window ambiguous counting results within the IF filter bandwidth are obtained. The counting range is 127 counts above and 127 counts below the nominal IF of 10.7 MHz for FM and 450 kHz for AM.

The IF-count windows are valid for a crystal oscillator frequency of 61.5 MHz.

The FM/AM switching is carried out by bit 0 of byte 2 of the received data of the IC.

The IF-counter operates continuously.

The IF-counter and window-counter will be reset when the I²C-bus logic detects the address of the IC. This disables changes in the latches for the IF-count, while reading this value. If the transmission to the front-end IC is disabled after the synthesizer loop of the TEA6810T/TEA6811T front-end IC has locked for a new frequency, the IF-count will be available after the set measuring time.

The IF-counter starts at 0. The IF-counter output are the **8 least significant bits** of the counting result.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (order code 9398 652 90011).

Reflow soldering

Reflow soldering techniques are suitable for all VSO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

Wave soldering

Wave soldering techniques can be used for all VSO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale

PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
