DESCRIPTION

The 74LV573 is a low-voltage Si-gate CMOS device that is pin and function compatible with 74HC/HCT573.

The 74LV573 is an octal D-type transparent latch featuring separate D-type inputs for each latch and 3-State outputs for bus oriented applications. A latch enable (LE) input and an output enable ($\overline{OE}$) input are common to all internal latches.

The '573' consists of eight D-type transparent latches with 3-State true outputs. When LE is HIGH, data at the D_n inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change each time its corresponding D-input changes.

When LE is LOW the latches store the information that was present at the D-inputs a set-up time preceding the HIGH-to-LOW transition of LE. When $\overline{OE}$ is LOW, the contents of the eight latches are available at the outputs. When $\overline{OE}$ is HIGH, the outputs go to the high impedance OFF-state. Operation of the $\overline{OE}$ input does not affect the state of the latches.

The '573' is functionally identical to the '563' and the '373', but the '563' has inverted outputs and the '373' has a different pin arrangement.

QUICK REFERENCE DATA

GND = 0V; T_{amb} = 25°C; $t_r = t_f \leq 2.5$ ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL	UNIT
t_{PHL}/t_{PLH}	Propagation delay Dn to Qn LE to Qn	C_L = 15pF V_{CC} = 3.3V	 12 13	ns
C_I	Input capacitance		3.5	pF
C_{PD}	Power dissipation capacitance per latch	Notes 1, 2	26	pF

NOTES:

1. C_{PD} is used to determine the dynamic power dissipation (P_D in µW)
   $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$ where:
   f_i = input frequency in MHz; C_L = output load capacity in pF;
   f_o = output frequency in MHz; V_{CC} = supply voltage in V;
   $\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of the outputs.
2. The condition is V_I = GND to V_{CC}.
