## DESCRIPTION

The 74LV595 is a low-voltage Si-gate CMOS device that is pin and function compatible with 74HC/HCT595.

The74LV595 is an 8 -stage serial shift register with a storage register and 3-State outputs. The shift register and storage register have separate clocks.

Data is shifted on the positive-going transitions of the $\mathrm{SH}_{\mathrm{CP}}$ input. The data in each register is transferred to the storage register on a positive-going transition of the $\mathrm{ST}_{\mathrm{CP}}$ input. If both clocks are connected together, the shift register will always be one clock pulse ahead of the storage register.

The shift register has a serial input ( $\mathrm{D}_{\mathrm{S}}$ ) and a serial standard output ( $\mathrm{Q}_{7}$ ) all for cascading. It is also provided with asynchronous reset (active LOW) for all 8 shift register stages. The storage register has 8 parallel 3-State bus driver outputs. Data in the storage register appears at the output whenever the output enable input (OE) is LOW.

## NOTES

1. $\mathrm{C}_{\mathrm{PD}}$ is used to determine the dynamic power dissipation ( $\mathrm{P}_{\mathrm{D}}$ in $\mu \mathrm{W}$ )
$P_{D}=C_{P D} \times V_{C C}{ }^{2} \times f_{i}+\sum\left(C_{L} \times V_{C C}{ }^{2} \times f_{0}\right)$ where:
$\mathrm{f}_{\mathrm{i}}=$ input frequency in MHz; $\mathrm{C}_{\mathrm{L}}=$ output load capacitance in pF ;
$\mathrm{f}_{\mathrm{O}}=$ output frequency in MHz; $\mathrm{V}_{\mathrm{CC}}=$ supply voltage in V ;
$\sum\left(C_{L} \times V_{C C}{ }^{2} \times f_{o}\right)=$ sum of the outputs.
2. The condition is $\mathrm{V}_{\mathrm{I}}=\mathrm{GND}$ to $\mathrm{V}_{\mathrm{CC}}$.
