## Infrared remote control transmitter RC5

## PCA8521

## FEATURES

- RC5 protocol
- Maximum of:
  - 56 keys (20-pin version)
  - 30 keys (16-pin version).
- Option of multi-system or single system transmitter
  - Multi-system: maximum 8 systems, selection by key
  - Single system: maximum 8 different systems per IC, selection by jumper wire or switch.
- Power-down and key wake-up
- High output current ( $\leq 45$  mA)
- Oscillator frequency of 432 kHz or 4 MHz
- Multiple key protection
- Option of 25% or 33% duty factor
- Contained in DIP16, SO16, DIP20 or SO20 packages.

## GENERAL DESCRIPTION

The PCA8521 can be used in infrared remote control transmitters. It generates output pulses, in accordance with the RC5 protocol, when a key is pressed. The IC does not contain a software programmable processor. However, it does contain a ROM in which the codes that have to be transmitted are stored. An example of an application diagram using a 20-pin IC is illustrated in Fig.7. The oscillator frequency may be optionally chosen as 432 kHz or 4 MHz. For 432 kHz additional external capacitors must be connected. The capacitors for a 4 MHz oscillator is integrated. When a key in the key-matrix is pressed a drive line will be connected to a sense line. This causes the oscillator to start and a corresponding code will be generated conforming to the RC5 protocol.

Seven drive lines ( $\overline{DR0}$  to  $\overline{DR6}$ ) and eight sense lines (SN0 to SN7) may be connected via the key matrix to scan the keys (see Fig.1).

When two or more keys are activated simultaneously no transmission will take place.

## ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
PCA8521FP	DIP16	plastic dual in-line package; 16 leads (300 mil)	SOT38-4
PCA8521FT	SO16	plastic small outline package; 16 leads; body width 7.5 mm	SOT162-1
PCA8521BP	DIP20	plastic dual in-line package; 20 leads (300 mil)	SOT146-1
PCA8521BT	SO20	plastic small outline package; 20 leads; body width 7.5 mm	SOT163-1

**FUNCTIONAL DESCRIPTION**

Key numbering for the matrix is given in Tables 1 and 2.

**Table 1** Key numbering for 16-pin package

DRIVER LINES	SENSE LINES					
	SN0	SN1	SN2	SN3	SN4	SN5
$\overline{\text{DR0}}$	0	1	2	3	4	5
$\overline{\text{DR1}}$	8	9	10	11	12	13
$\overline{\text{DR2}}$	16	17	18	19	20	21
$\overline{\text{DR3}}$	24	25	26	27	28	29
$\overline{\text{DR4}}$	32	33	34	35	36	37

**Table 2** Key numbering for 20-pin package

DRIVER LINES	SENSE LINES							
	SN0	SN1	SN2	SN3	SN4	SN5	SN6	SN7
$\overline{\text{DR0}}$	0	1	2	3	4	5	6	7
$\overline{\text{DR1}}$	8	9	10	11	12	13	14	15
$\overline{\text{DR2}}$	16	17	18	19	20	21	22	23
$\overline{\text{DR3}}$	24	25	26	27	28	29	30	31
$\overline{\text{DR4}}$	32	33	34	35	36	37	38	39
$\overline{\text{DR5}}$	40	41	42	43	44	45	46	47
$\overline{\text{DR6}}$	48	49	50	51	52	53	54	55

When the keys have been scanned the key-number of the activated key serves as the address of the ROM to obtain the required code-word. When a 16-pin IC is used the following sense lines and driver lines will not be connected; SN6, SN7,  $\overline{\text{DR5}}$  and  $\overline{\text{DR6}}$ . Consequently, key numbers 6, 7, 14, 15, 22, 23, 30, 31, 38, 39 and 40 to 55 will not be addressed.

The ROM contains 8 banks of 64 code-words. Thus for each key a maximum of 8 different code-words may be generated. With multi-system use, 8 different systems (e.g. TV, VCR, tuner, CD etc.) may be selected. Apart from the system bits the command bits may also be different in different banks (true multi-function keys). Selection can be performed using the keys. For each key three bank select bits are present that determine which bank will be selected for the next key.

For each key an 'inhibit' bit is also present. When this bit is at logic 1 at an address in a given bank, and when the corresponding key is pressed (when this bank has been selected) no transmission will take place.

A single system option is available however, whereby instead of keys a jumper wire and/or a switch may be used for bank selection. Using this option it is possible to program different transmitter models in one IC and select the required bank by means of a jumper wire. Instead of a jumper wire a side-switch may also be used to change the generated code temporarily (select different bank) to obtain multi-function keys. With this option the jumper wires or switch must be connected between sense line SN0 and one of the drive lines  $\overline{\text{DR0}}$  to  $\overline{\text{DR6}}$  or ground. This means that SN0 cannot be used to connect keys and the maximum number of keys will be 25 keys for a 16-pin package and 49 keys for a 20-pin package.

It is not possible to use a combination of jumper wires and selection keys for bank selection in one unit.

The output of the ROM is loaded into a shift register that provides the input bits for the pulse generator. This pulse generator drives the output pin.

## Infrared remote control transmitter RC5

PCA8521

### Timing generator

A schematic diagram of the timing generator is illustrated in Fig.4. The oscillator frequency is 432 kHz or 4 MHz. The timing generator is stopped when no key is activated and started again when a key is pressed.

The output of the oscillator (CLK1) is divided by 111 for 4 MHz or by 12 for 432 kHz. Selection is achieved using a mask option. The output of the divider is CLK2 which is used for clocking of the control timer. The frequency of CLK2 is 36 kHz and the inverse is used to generate the output pulses in the subcarrier frequency. By mask option the duty factor can be chosen to be 25% or 33%.

The control timer has a length of 4096 subcarrier (pulse) periods. This is equal to the transmission repetition time. A bit time is equal to 64 pulses and the repetition time is 64 bit times. The control timer provides the timing of the key scanning, the ROM access and the code transmission. When the control timer has arrived at a certain state, and no key has been pressed for at least 28 ms, a stop signal will be generated which will stop the oscillator. All drive lines will then be set to logic 0. As soon as a key is pressed one of the sense lines will become logic 0. This will generate a start signal which will restart the oscillator.

### Key scanning

Six bits of the control timer are used to control the key scanning, subsequently 64 time slots are available. Each time slot corresponds to a key number. The 3 most significant bits (MSBs) control the drive lines and the 3 least significant bits (LSBs) control the sense lines. The scan timing is illustrated in Fig.5. In the first 8 time slots drive line  $\overline{DR0}$  is LOW. During this time the 8 sense lines SN0 to SN7 are sequentially tested. The same occurs for the next 8 time slots when  $\overline{DR1}$  is at logic 0 and so on until  $\overline{DR6}$  is at logic 0. After testing there are 8 time slots when no drive line is at logic 0 (all drive lines HIGH).

When, during time slots 0 to 63, one of the sense lines is at logic 0 the contents of the 6 bits is stored in the key register. This register is used to address the ROM.

No transmission will take place when two or more keys are activated. This situation is considered to be the same as 'no key' and the control bit in the command word for the next transmission will be toggled.

When no key is pressed the oscillator will stop at the end of the control timer (see Section "Timing generator"). In this situation all drive lines will be set to logic 0. When one of the keys is pressed again a wake-up will occur by starting the oscillator.

An option is available to select 'single' or 'multi' system.

### Single system

SN0 should be connected to one of the drive lines or ground.

The bank that will be selected is equal to drive line number to which SN0 is connected. When connected to ground the number will be 7. This is achieved by loading the bank select flip-flops BS0 to BS2 with the contents of C5 to C7 of the control timer (see Fig.4) when sense line SN0 is at logic 0. In this way it is possible to use two different systems in one transmitter by using a side switch. With this option SN0 cannot be used to connect keys, so the maximum number of keys will be lower. (49 keys with 20-pin IC and 25 keys with 16-pin IC).

### Multi system

The bank is selected by key for maximum 8 different systems (e.g. TV, VCR, CD, etc.), any key is flexible for bank selection. When a user inserts a new battery, the default bank is always in bank 7. If only bank 7 is used, then maximum number of keys can be:

- 56 keys for a 20-pin IC
- 30 keys for 16-pin IC.

### ROM

A schematic diagram of the ROM is illustrated in Fig.6. The ROM is divided into 8 banks of  $2 \times 64$  bytes. Bank selection is performed using flip-flops BS0 to BS2 that are the 3 highest bits of the address. With the 'single system' these bits are loaded from the 3 MSBs of the scan control when SN0 = 0. At power-on the bank select flip-flops will be in an arbitrary state.

When a key was activated, the key number is stored in the 6-bit key register. This register forms the lower bits of the ROM address. For each command the ROM will be accessed twice. This gives 16 bits in total (M0L to M7L and M0H to M7H). The bits are described in Table 3.

Infrared remote control transmitter RC5

PCA8521

**Table 3** ROM bit description

BITS	FUNCTION
M0L to M5L	Command bits 0 to 5.
M6L	Field bit. This bit indicates whether command codes 0 to 63 are used (field bit is at logic 1) or command codes 64 to 127 are used (field bit is at logic 0).
M7L	Inhibit bit. When this bit is at logic 1 no transmission will take place. When this bit is at logic 0 the appropriate code-word will be transmitted.
M0H to M4H	System bits 0 to 4.
M5H to M7H	Bank select. Will be stored in BS0 to BS2 when the 'multi-system' option is selected. With single system bits M5H to M7H are don't care.

**Pulse output**

The bits of the remote control word, as indicated by the addressed ROM locations, are loaded into a shift register every bit-time this register is shifted. The output is used to generate a logic 0 or a logic 1 in the biphas (Manchester) coding, modulated with a frequency of 36 kHz. The duty factor of the modulation pulses may be selected (optionally) to be 25% or 33.3%. The output of the pulse generator controls the output driver that can provide a maximum current of 45 mA.

## CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{DD}$	operating supply voltage		2.0	–	5.5	V
$I_{DD}$	supply current	$V_{DD} = 5\text{ V}$ ; $T_{amb} = 25\text{ }^{\circ}\text{C}$	–	–	2	mA
$I_{DD(q)}$	quiescent current	$V_{DD} = 3\text{ V}$ ; $T_{amb} = 25\text{ }^{\circ}\text{C}$	–	–	1	$\mu\text{A}$
$T_{amb}$	operating ambient temperature		–10	–	+50	$^{\circ}\text{C}$
<b>Sense lines (input only and will have a weak internal pull-up resistance)</b>						
$V_{IL}$	LOW level input voltage		–	–	$0.3V_{DD}$	V
$V_{IH}$	HIGH level input voltage		$0.7V_{DD}$	–	–	V
$R_{pu}$	pull-up resistance	$V_{DD} = 2\text{ V}$	50	–	100	$\text{k}\Omega$
<b>Driver lines (output only; open drain; maximum on-resistance when LOW)</b>						
$R_{on}$	maximum on-resistance	$V_{DD} = 2\text{ V}$	–	–	2	$\text{k}\Omega$
<b>Output driver (has a weak pull-up resistance)</b>						
$I_{sink}$	sink current	$V_{DD} = 2\text{ V}$ ; $V_o = 1\text{ V}$	–	–	45	mA
$R_{pu}$	pull-up resistance	$V_{DD} = 2\text{ V}$	–	–	5	$\text{k}\Omega$

## Infrared remote control transmitter RC5

## PCA8521

## SYSTEM DEVELOPMENT

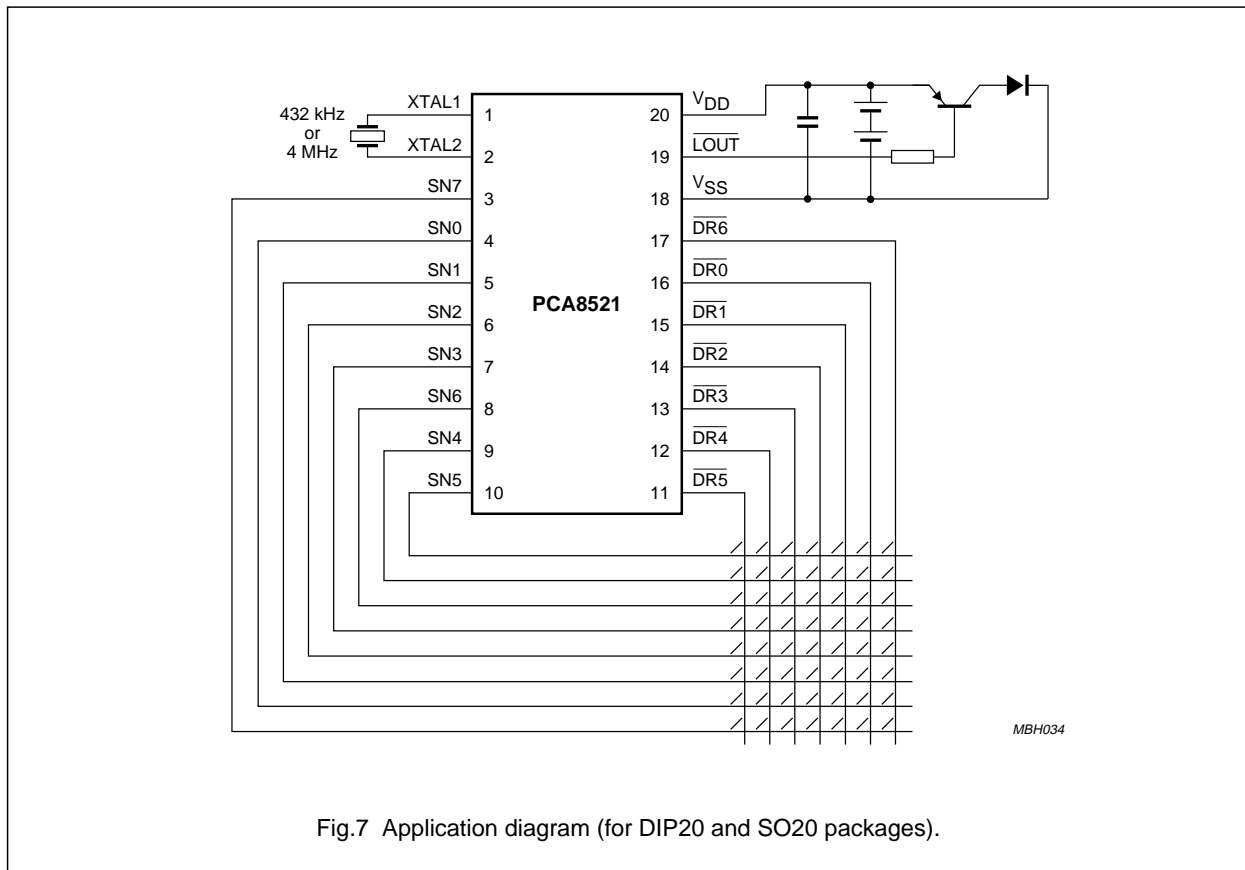

## Software (RC8521)

A PC program is provided that enables the user to fill in system and command codes for each key number in each bank. This program converts the input data into a ROM code-file needed to produce the metal mask and to program an EPROM to be used in the hardware emulator.

## Hardware (OM4839)

An emulator is available that functionally emulates the IC. An EPROM with the ROM code information is inserted into the emulator to produce the required remote control codes corresponding to the keys in the prototype device.

### SOLDERING

#### Introduction

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "*Data Handbook IC26; Integrated Circuit Packages*" (document order number 9398 652 90011).

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mount components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

#### Through-hole mount packages

##### SOLDERING BY DIPPING OR BY SOLDER WAVE

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joints for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg(max)}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

##### MANUAL SOLDERING

Apply the soldering iron (24 V or less) to the lead(s) of the package, either below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

#### Surface mount packages

##### REFLOW SOLDERING

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stenciling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 250 °C. The top-surface temperature of the packages should preferably be kept below 230 °C.

##### WAVE SOLDERING

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

##### MANUAL SOLDERING

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## Infrared remote control transmitter RC5

PCA8521

**Suitability of IC packages for wave, reflow and dipping soldering methods**

MOUNTING	PACKAGE	SOLDERING METHOD		
		WAVE	REFLOW <sup>(1)</sup>	DIPPING
Through-hole mount	DBS, DIP, HDIP, SDIP, SIL	suitable <sup>(2)</sup>	–	suitable
Surface mount	BGA, SQFP	not suitable	suitable	–
	HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, SMS	not suitable <sup>(3)</sup>	suitable	–
	PLCC <sup>(4)</sup> , SO, SOJ	suitable	suitable	–
	LQFP, QFP, TQFP	not recommended <sup>(4)(5)</sup>	suitable	–
	SSOP, TSSOP, VSO	not recommended <sup>(6)</sup>	suitable	–

**Notes**

1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *"Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods"*.
2. For SDIP packages, the longitudinal axis must be parallel to the transport direction of the printed-circuit board.
3. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
4. If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
5. Wave soldering is only suitable for LQFP, QFP and TQFP packages with a pitch (e) equal to or larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
6. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

**DEFINITIONS**

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

**PURCHASE OF PHILIPS RC5 COMPONENTS**

Purchase of Philips RC5 components conveys a license under the Philips RC5 patent to use the components in RC5 system products conforming to the RC5 standard UATM-5000 for allocation of remote control commands defined by Philips.
