2. Notes

- The device uses positive logic, and a logic high voltage corresponds to a 1 in a register bit.
- Do not set the clock to impossible dates (17:34 pm on February 30th, for example). The results are unpredictable.
- When the device is powered on, the initial settings of all bits are undefined.

Register functions

1. Date and time registers

- The register values are in BCD, and used positive logic.
E.g.(S₈, S₄, S₂, S₁) = (1, 0, 0, 1) = 9 seconds

- Day-of-week register
The value is coded as 0 to 6, with Sunday = 0.

Code	0	1	2	3	4	5	6
Day	Sun.	Mon.	Tue.	Wed.	Thu.	Fri.	Sat.

- pm/am, h₂₀ and h₁₀ registers
The range of these values depends on whether the 12-hour or 24-hour clock is being used.
The pm/am bit is used only when the 12-hour clock is selected.
Set D₃ to 1 for the 24-hour, and to 0 for the 12-hour clock.
Set D₂ to 1 for pm and to 0 for am. Writing a 1 to bit D₃ automatically resets bit D₂ to 0.

Selection	Value range
12-hour clock	12:00 to 11:59 am and pm *
24-hour clock	00:00 to 23:59

* Note: 12:00 am represents 12:00 midnight, and 12:00 pm represents 12:00 noon.

- Y₁ and Y₁₀ Leap year selection
Bits D₃ and D₂ of the day tens register select the year value module 4 to be used for leap years.

Calendar	D ₃	D ₂	Value module 4 for leap year
Standard calendar	0	0	0
	0	1	3
	1	0	2
	1	1	1

- Do not set the clock to impossible dates (17:34 pm on February 30th, for example). The results are unpredictable.

2. Reset register (Control register D)

Select this register to reset the last five stages of the $1/2^{15}$ divider, and the busy circuit.

Latch the hexadecimal value D using the ADDRESS LATCH pin, and set WRITE high to carry out the reset.

3. Reference signal (Control registers E and F)

Latch the hexadecimal value E or F using the ADDRESS LATCH pin, and set WRITE high to obtain the reference signal values on D₀ to D₃.

■ Application notes

- (1) In order to realize low-power operation, the device has a high impedance; the shaded portion in the figure below is highly susceptible to inductance effects, and should be kept clear of signal lines.

- (2) Power supply filter capacitor
To ensure stable operation against transients and noise, connect a bypass capacitor of at least 0.01 μ F (ceramic) across the power supply, close to the device.
- (3) This device passes a drop test (from 75 cm onto a hard board), but it is possible for the crystal resonator to be damaged by the shocks produced by some mounting equipment. It is important to confirm that the mounting conditions for the equipment being used do not adversely affect performance. Re-check if any of the mounting conditions change.
- (4) There is a possibility of damage to the crystal resonator during ultrasonic cleaning. Because of the wide variation of conditions in ultrasonic cleaning equipment, the performance of this device is not guaranteed if it is subject to ultrasonic cleaning.
- (5) This is a CMOS device, and the standard precautions against static electricity should be taken.
