

Serial SPI bus real-time clock with battery switchover

Features

- Ultra-low battery supply current of 365 nA
- Factory calibrated accuracy ± 5 ppm guaranteed after 2 reflows (SOX18)
 - Much better accuracies achievable using built-in programmable analog and digital calibration circuits
- 2.0 V to 5.5 V clock operating voltage
- Counters for tenths/hundredths of seconds, seconds, minutes, hours, day, date, month, year, and century
- Automatic switchover and reset output circuitry (fixed reference)
 - M41T93S: $V_{CC} = 3.0$ V to 5.5 V (2.85 V $\leq V_{RST} \leq 3.00$ V)
 - M41T93R: $V_{CC} = 2.7$ V to 5.5 V (2.55 V $\leq V_{RST} \leq 2.70$ V)
 - M41T93Z: $V_{CC} = 2.38$ V to 5.50 V (2.25 V $\leq V_{RST} \leq 2.38$ V)
- Compatible with SPI bus serial interface (supports SPI mode 0 [CPOL = 0, CPHA = 0])
- Programmable alarm with interrupt function (valid even during battery backup mode)
- Optional 2nd programmable alarm available
- Square wave output (defaults to 32 KHz on power-up)
- RESET (\overline{RST}) output
- Watchdog timer
- Programmable 8-bit counter/timer
- 7 bytes of battery-backed user SRAM
- Battery low flag
- Low operating current of 80 μ A
- Oscillator stop detection
- Battery or SuperCap™ backup
- Operating temperature of -40 °C to $+85$ °C

- Package options include:
 - a 16-lead QFN or an 18-lead embedded crystal SOIC
- RoHS compliance: lead-free components are compliant with the RoHS directive

1 Description

The M41T93 is a low-power serial SPI bus real-time clock with a built-in 32.768 kHz oscillator (external crystal-controlled for the QFN16 package, and embedded crystal for the SOX18 package). Eight bytes of the register map are used for the clock/calendar function and are configured in binary coded decimal (BCD) format. An additional 17 bytes of the register map provide status/control of the two alarms, watchdog, 8-bit counter, and square wave functions. An additional seven bytes are made available as user SRAM.

Addresses and data are transferred serially via a serial SPI bus-compatible interface. The built-in address register is incremented automatically after each WRITE or READ data byte. The M41T93 has a built-in power sense circuit which detects power failures and automatically switches to the battery supply when a power failure occurs. The energy needed to sustain the clock operations can be supplied by a small lithium button battery when a power failure occurs.

Functions available to the user include a non-volatile, time-of-day clock/calendar, alarm interrupt, watchdog timer, programmable 8-bit counter, and square wave outputs. The eight clock address locations contain the century, year, month, date, day, hour, minute, second, and tenths/hundredths of a second in 24-hour BCD format. Corrections for 28, 29 (leap year), 30, and 31 day months are made automatically. The M41T93 is supplied in either a QFN16 or an SOX18, 300 mil SOIC which includes an embedded 32 KHz crystal. The SOX18 package requires only a user-supplied battery to provide non-volatile operation.

Figure 1. Logic diagram

2. CPOL (clock polarity) and CPHA (clock phase) are bits that may be set in the SPI control register of the MCU.

Table 2. Function table

Mode	E	SCL	SDI	SDO
Disable reset	H	Input disabled	Input disabled	High Z
WRITE	L		Data bit latch	High Z
READ	L		X	Next data bit shift ⁽¹⁾

1. SDO remains at High Z until eight bits of data are ready to be shifted out during a READ.

Figure 6. Data and clock timing

Note: Supports SPI mode 0 (CPOL = 0, CPHA = 0) only.

1.1 SPI signal description

1.1.1 Serial data output (SDO)

The output pin is used to transfer data serially out of the memory. Data is shifted out on the falling edge of the serial clock.

1.1.2 Serial data input (SDI)

The input pin is used to transfer data serially into the device. Instructions, addresses, and the data to be written, are each received this way. Input is latched on the rising edge of the serial clock.

1.1.3 Serial clock (SCL)

The serial clock provides the timing for the serial interface (as shown in [Figure 20 on page 42](#) and [Figure 21 on page 42](#)). The W/R bit, addresses, or data are latched, from the input pin, on the rising edge of the clock input. The output data on the SDO pin changes state after the falling edge of the clock input.

The M41T93 can be driven by a microcontroller with its SPI peripheral running in only mode 0: (CPOL, CPHA) = (0,0).

For this mode, input data (SDI) is latched in by the low-to-high transition of clock SCL, and output data (SDO) is shifted out on the high-to-low transition of SCL (see [Table 2 on page 10](#) and [Figure 6 on page 10](#)).

1.1.4 Chip enable (\bar{E})

When \bar{E} is high, the memory device is deselected, and the SDO output pin is held in its high impedance state.

After power-on, a high-to-low transition on \bar{E} is required prior to the start of any operation.

2 Operation

The M41T93 clock operates as a slave device on the SPI serial bus. Each memory device is accessed by a simple serial interface that is SPI bus-compatible. The bus signals are SCL, SDI, and SDO (see [Table 1 on page 7](#) and [Figure 5 on page 10](#)). The device is selected when the chip enable input (\bar{E}) is held low. All instructions, addresses and data are shifted serially in and out of the chip. The most significant bit is presented first, with the data input (SDI) sampled on the first rising edge of the clock (SCL) after the chip enable (\bar{E}) goes low. The 32 bytes contained in the device can then be accessed sequentially in the following order:

- 1 Tenths/hundredths of a second register
- 2 Seconds register
- 3 Minutes register
- 4 Century/hours register
- 5 Day register
- 6 Date register
- 7 Month register
- 8 Year register
- 9 Digital calibration register
- 10 Watchdog register
- 11-15 Alarm1 registers
- 16 Flags register
- 17 Timer value register
- 18 Timer control register
- 19 Analog calibration register
- 20 Square wave register
- 21-25 Alarm2 registers
- 26-32 User RAM

The M41T93 clock continually monitors V_{CC} for an out-of tolerance condition. Should V_{CC} fall below V_{RST} , the device terminates an access in progress and resets the device address counter. Inputs to the device will not be recognized at this time to prevent erroneous data from being written to the device from a an out-of-tolerance system.

The power input will also be switched from the V_{CC} pin to the external battery when V_{CC} falls below the battery back-up switchover voltage ($V_{SO} = V_{RST}$). At this time the clock registers will be maintained by the battery supply. As system power returns and V_{CC} rises above V_{SO} , the battery is disconnected, and the power supply is switched to external V_{CC} .

Write protection continues until V_{CC} reaches V_{PFD} (min) plus t_{REC} (min). For more information on battery storage life refer to application note AN1012.

2.1 SPI bus characteristics

The serial peripheral interface (SPI) bus is intended for synchronous communication between different ICs. It consists of four signal lines: serial data input (SDI), serial data output (SDO), serial clock (SCL) and a chip enable (\bar{E}).

By definition a device that gives out a message is called “transmitter,” the receiving device that gets the message is called “receiver.” The device that controls the message is called “master.” The devices that are controlled by the master are called “slaves.”

The \bar{E} input is used to initiate and terminate a data transfer. The SCL input is used to synchronize data transfer between the master (micro) and the slave (M41T93) device.

The SCL input, which is generated by the microcontroller, is active only during address and data transfer to any device on the SPI bus (see [Figure 5 on page 10](#)).

The M41T93 can be driven by a microcontroller with its SPI peripheral running in only mode 0: (CPOL, CPHA) = (0,0).

For this mode, input data (SDI) is latched in by the low-to-high transition of clock SCL, and output data (SDO) is shifted out on the high-to-low transition of SCL (see [Table 2](#) and [Figure 6 on page 10](#)).

There is one clock for each bit transferred. Address and data bits are transferred in groups of eight bits. Due to memory size the second most significant address bit is a “don’t care” (address bit 6).

2.2 READ and WRITE cycles

Address and data are shifted MSB first into the serial data input (SDI) and out of the serial data output (SDO). Any data transfer considers the first bit to define whether a READ or WRITE will occur. This is followed by seven bits defining the address to be read or written. Data is transferred out of the SDO for a READ operation and into the SDI for a WRITE operation. The address is always the second through the eighth bit written after the enable (\bar{E}) pin goes low. If the first bit is a '1,' one or more WRITE cycles will occur. If the first bit is a '0,' one or more READ cycles will occur (see [Figure 7](#) and [Figure 8 on page 14](#)).

Data transfers can occur one byte at a time or in multiple byte burst mode, during which the address pointer will be automatically incremented. For a single byte transfer, one byte is read or written and then \bar{E} is driven high. For a multiple byte transfer all that is required is that \bar{E} continue to remain low. Under this condition, the address pointer will continue to increment as stated previously. Incrementing will continue until the device is deselected by taking \bar{E} high. The address will wrap to 00h after incrementing to 3Fh.

The system-to-user transfer of clock data will be halted whenever the address being read is a clock address (00h to 07h). Although the clock continues to maintain the correct time, this will prevent updates of time and date during either a READ or WRITE of these address locations by the user. The update will resume either due to a deselect condition or when the pointer increments to a non-clock or RAM address (08h to 1Fh).

Note: This is true both in READ and WRITE mode.

Figure 7. READ mode sequence

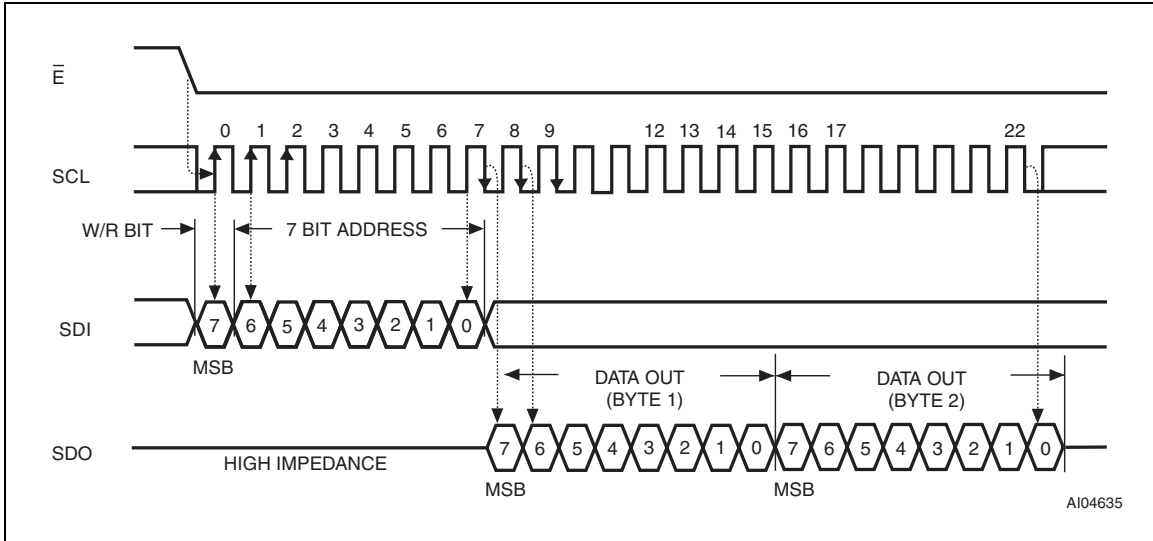

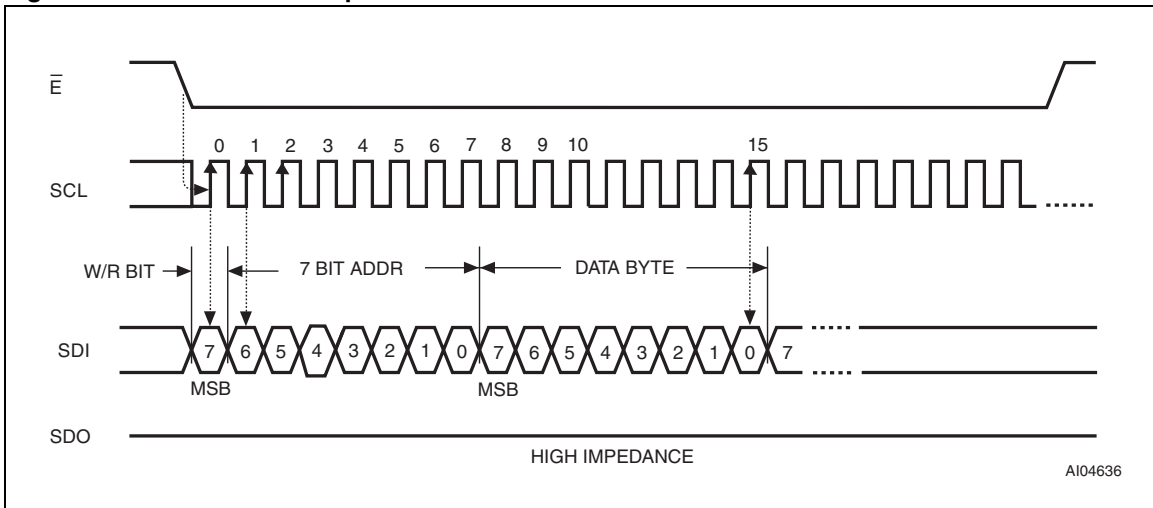

Figure 8. WRITE mode sequence

2.3 Data retention and battery switchover ($V_{SO} = V_{RST}$)

Once V_{CC} falls below the switchover voltage ($V_{SO} = V_{RST}$), the device automatically switches over to the battery and powers down into an ultra low current mode of operation to preserve battery life. If V_{BAT} is less than, or greater than V_{RST} , the device power is switched from V_{CC} to V_{BAT} when V_{CC} drops below V_{RST} (see [Figure 19 on page 41](#)). At this time the clock registers and user RAM will be maintained by the attached battery supply.

When it is powered back up, the device switches back from battery to V_{CC} at $V_{SO} +$ hysteresis. When V_{CC} rises above V_{RST} , it will recognize the inputs. For more information on battery storage life refer to application note AN1012.

2.4 Power-on reset (t_{rec})

The M41T93 continuously monitors V_{CC} . When V_{CC} falls to the power fail detect trip point, the \overline{RST} output pulls low (open drain) and remains low after power-up for t_{rec} (210ms typical) after V_{CC} rises above V_{RST} (max).

Note: The t_{rec} period does not affect the RTC operation. Write protect only occurs when V_{CC} is below V_{RST} . When V_{CC} rises above V_{RST} , the RTC will be selectable immediately. Only the \overline{RST} output is affected by the t_{rec} period.

The \overline{RST} pin is an open drain output and an appropriate pull-up resistor to V_{CC} should be chosen to control the rise time.

3 Clock operation

The M41T93 is driven by a quartz-controlled oscillator with a nominal frequency of 32.768 kHz. The accuracy of the real-time clock depends on the frequency of the quartz crystal that is used as the time-base for the RTC.

The 8-byte clock register (see [Table 3 on page 20](#)) is used to both set the clock and to read the date and time from the clock, in binary coded decimal format. Tenths/hundredths of seconds, seconds, minutes, and hours are contained within the first four registers.

Bit D7 of register 01h contains the STOP bit (ST). Setting this bit to a '1' will cause the oscillator to stop. When reset to a '0' the oscillator restarts within one second (typical).

Note: Upon initial power-up, the user should set the ST bit to a '1,' then immediately reset the ST bit to '0.' This provides an additional "kick-start" to the oscillator circuit.

Bits D6 and D7 of clock register 03h (century/ hours register) contain the CENTURY bit 0 (CB0) and CENTURY bit 1 (CB1). Bits D0 through D2 of register 04h contain the day (day of week). Registers 05h, 06h, and 07h contain the date (day of month), month, and years. The ninth clock register is the digital calibration register, while the analog calibration register is found at address 12h (these are both described in the clock calibration section). Bit D7 of register 09h (watchdog register) contains the oscillator fail interrupt enable bit (OFIE). When the user sets this bit to '1,' any condition which sets the oscillator fail bit (OF) (see [Oscillator fail detection on page 35](#)) will also generate an interrupt output.

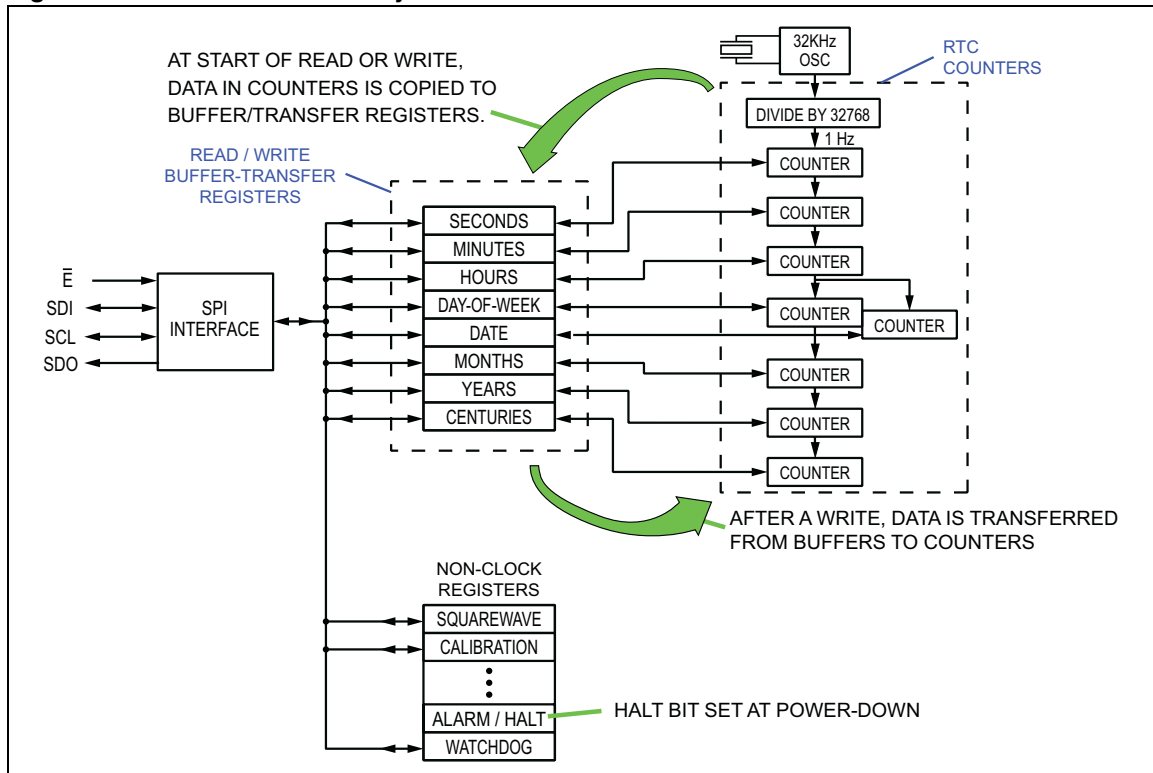

Note: A WRITE to ANY location within the first eight bytes of the clock register (00h-07h), including the ST bit and CB0-CB1 bits will result in an update of the system clock and a reset of the divider chain. This could result in an inadvertent change of the current time. These non-clock related bits should be written prior to setting the clock, and remain unchanged until such time as a new clock time is also written.

The eight clock registers may be read one byte at a time, or in a sequential block. Provision has been made to assure that a clock update does not occur while any of the eight clock addresses are being read. If a clock address is being read, an update of the clock registers will be halted. This will prevent a transition of data during the READ.

3.1 Clock data coherency

In order to synchronize the data during reads and writes of the real-time clock device, a set of buffer transfer registers resides between the SPI serial interface on the user side, and the clock/calendar counters in the part. While the read/write data is transferred in and out of the device one bit at a time to the user, the transfers between the buffer registers and counters occur such that all the bits are copied simultaneously. This keeps the data coherent and ensures that none of the counters are incremented while the data is being transferred.

Figure 9. Clock data coherency

3.1.1 Example of incoherency

Without having the intervening buffer/transfer registers, if the user began directly reading the counters at 23:59:59, a read of the seconds register would return 59 seconds. After the address pointer incremented, the next read would return 59 minutes. Then the next read should return 23 hours, but if the clock happened to increment between the reads, the user would see 00 hours. When the time was re-assembled, it would appear as 00:59:59, and thus be incorrect by one hour.

By using the buffer/transfer registers to hold a copy of the time, the user is able to read the entire set of registers without any values changing during the read.

Similarly, when the application needs to change the time in the counters, it is necessary that all the counters be loaded simultaneously. Thus, the user writes sequentially to the various buffer/transfer registers, then they are copied to the counters in a single transfer thereby coherently loading the counters.

3.1.2 Accessing the device

The M41T93 is comprised of 32 addresses which provide access to registers for time and date, digital and analog calibration, two alarms, watchdog, flags, timer, squarewave and NVRAM. The clock and alarm parameters are in binary coded decimal (BCD) format. The calibration, timer, watchdog, and squarewave parameters are in a binary format.

In the case of the M41T93, at the start of each read or write serial transfer, the counters are automatically copied to the buffer registers. In the event of a write to any register in the range 0-7, at the end of the serial transfer, the buffer registers are copied back into the counters thus revising the date/time. Any of the eight clock registers (addresses 0-7) not updated during the transfer will have its old value written back into the counters. For example, if only the seconds value is revised, the other seven counters will end up with the same values they had at the start of the serial transfer.

However, writes which do not affect the clock registers - that is, a write only to the non-clock registers (addresses 0x08 to 0x1F) - will not cause the buffer registers to be copied back to the counters. The counters are only updated if a register in the range 0-7 was written.

Whenever the RTC registers (addresses 0-7) are written, the divider chain from the oscillator is reset.

3.2 Halt bit (HT) operation

When the part is powered down into battery backup mode, a control bit, called the Halt or HT bit, is set automatically. This inhibits any subsequent transfers from the counters to the buffer registers thereby freezing in the buffer registers the time/date of the last access of the part.

Repeated reads of the clock registers will return the same value. After the HT bit is cleared, by writing bit 6 of address 0x0C to 0, the next read of the RTC will return the present time.

Note: Writes to the RTC registers (addresses 0-7) with the HT bit set can cause time corruption. Since the buffer registers contain the time of the last access prior to the HT bit being set, any write in the address range 0-7 will result in the time of the last access being copied back into the counters.

Example: The last access was November 17, 2009, at 16:15:07.77. The system later powered down thus setting the HT bit and freezing that value in the buffers. Later, on December 18, 2009, at 03:22:43.35, the system is powered up and the user writes the seconds to 46 without first clearing the HT bit. At the end of the serial transfer, the old time/date, with the seconds modified to 46, will be written back into the clock registers thereby corrupting them. The new, wrong time will be November 17, 2009, at 16:15:46.77. This makes it appear the RTC lost time during the power outage.

Thus, at power-up, the user should always clear the HT bit (write bit 6 to 0 at address 0x0C) before writing to any address in the range 0-7.

A typical power-up flow is to read the time of last access, then clear the HT bit, then read the current time.

3.2.1 Power-down time stamp

Some applications may need to determine the amount of time spent in backup mode. That can be calculated if the time of power-down and the time of power-up are known. The latter is straightforward to obtain. But the time of power-down is only available if an access occurred just prior to power-down. That is, if there was an access of the device just prior to power-down, the time of the access would have been frozen in the buffer transfer registers and thus the approximate time of power-down could be obtained.

If an application requires the time of power-down, the best way to implement it is to set up the software to do frequent reads of the clock, such as once every 1 or 5 seconds. That way, at power-up, the buffer-transfer registers will contain a time value within 1 (or 5) seconds of the actual time of power-down.

Table 3. Clock/control register map (32 bytes)

Addr									Function/range BCD format	
	D7	D6	D5	D4	D3	D2	D1	D0		
00h	0.1 seconds				0.01 seconds				Seconds	00-99

1. AF2 will always read '0' if the AL2E bit is set to '0'.

0 = Must be set to zero

ABE = Alarm in battery backup enable bit

A1IE = Alarm1 interrupt enable bit

AC0-AC6 = analog calibration bits

ACS = analog calibration sign bit

AF1, AF2 = Alarm flag

AL2E = Alarm 2 enable bit

BL = Battery low bit

BMB0-BMB4 = Watchdog multiplier bits

CB0, CB1 = Century bits

DC0-DC4 = Digital calibration bits

DCS = Digital calibration sign bit

FT = Frequency test bit

HT = Halt update bit

OF = Oscillator fail bit

OUT = Output level

OFIE = Oscillator fail interrupt enable

OTP = OTP control bit

RB0-RB2 = Watchdog resolution bits

RPT11-RPT15 = Alarm 1 repeat mode bits

RPT21-RPT25 = Alarm 2 repeat mode bits

RS0-RS3 = SQW frequency

SQWE = Square wave enable

SRAM/ALM2 = SRAM/Alarm 2 bit

ST = Stop bit

TD0, TD1 = Timer frequency bits

TE = Timer enable bit

TF = Timer flag

TI/TP = Timer interrupt or pulse

TIE = Timer interrupt enable

WDF = Watchdog flag

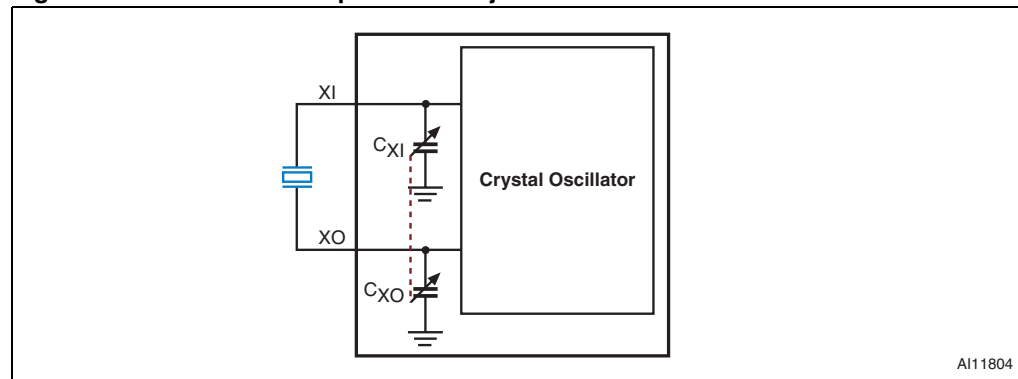

3.3 Real-time clock accuracy

The M41T93 is driven by a quartz controlled oscillator with a nominal frequency of 32,768 Hz. The accuracy of the real-time clock is dependent upon the accuracy of the crystal, and the match between the capacitive load of the oscillator circuit and the capacitive load for which the crystal was trimmed. Temperature also affects the crystal frequency, causing additional error (see [Figure 11 on page 25](#)).

The M41T93 provides the option of clock correction through either manufacturing calibration or in-application calibration. The total possible compensation is typically -93 ppm to $+156$ ppm. The two compensation circuits that are available are:

1. An analog calibration register (12h) can be used to adjust internal (on-chip) load capacitors for oscillator capacitance trimming. The individual load capacitors C_{X1} and C_{XO} (see [Figure 10](#)), are selectable from a range of -18 pF to $+9.75$ pF in steps of 0.25 pF. This translates to a calculated compensation of approximately ± 30 ppm (see [Analog calibration \(programmable load capacitance\) on page 24](#)).
2. A digital calibration register (08h) can also be used to adjust the clock counter by adding or subtracting a pulse at the 512 Hz divider stage. This approach provides periodic compensation of approximately -63 ppm to $+126$ ppm (see [Digital calibration \(periodic counter correction\) on page 22](#)).

Figure 10. Internal load capacitance adjustment

3.4 Clock calibration

The M41T93 oscillator is designed for use with a 12.5 pF crystal load capacitance. When the calibration circuit is properly employed, accuracy improves to better than ± 1 ppm at 25 °C.

The M41T93 design provides the following two methods for clock error correction.

3.4.1 Digital calibration (periodic counter correction)

This method employs the use of periodic counter correction by adjusting the ratio of the 100 Hz divider stage to the 512 Hz divider stage. Under normal operation, the 100Hz divider stage outputs precisely 100 pulses for every 512 pulses of the 512 Hz input stage to provide the input frequency to the fraction of seconds clock register. By adjusting the number of 512 Hz input pulses used to generate 100 output pulses, the clock can be sped up or slowed down, as shown in [Figure 13 on page 27](#).

When a non-zero value is loaded into the five calibration bits (DC4 – DC0) found in the digital calibration register (08h) and the sign bit is '1,' (indicating positive calibration), the 100 Hz stage outputs 100 pulses for every 511 input pulses instead of the normal 512. Since the 100 pulses are now being output in a shorter window, this has the effect of speeding up the clock by 1/512 seconds for each second the circuit is active. Similarly, when the sign bit is '0,' indicating negative calibration, the block outputs 100 pulses for every 513 input pulses. Since the 100 pulses are then being output in a longer window, this has the effect of slowing down the clock by 1/512 seconds for each second the circuit is active.

The amount of calibration is controlled by using the value in the calibration register (N) to generate the adjustment in one second increments. This is done for the first N seconds once every *eight* minutes for positive calibration, and for N seconds once every *sixteen* minutes for negative calibration (see [Table 4 on page 23](#)).

For example, if the calibration register is set to '100010,' then the adjustment will occur for two seconds in every minute. Similarly, if the calibration register is set to '000011,' then the adjustment will occur for 3 seconds in every alternating minute.

The digital calibration bits (DC4 – DC0) occupy the five lower order bits in the digital calibration register (08h). These bits can be set to represent any value between 0 and 31 in binary form. The sixth bit (DC5) is a sign bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within an 8-minute (positive) or 16-minute (negative) cycle. Therefore, each calibration step has an effect on clock accuracy of +4.068 or -2.034 ppm. Assuming that the oscillator is running at exactly 32,768 Hz, each of the 31 increments in the calibration byte would represent +10.7 or -5.35 seconds per month, which corresponds to a total range of +5.5 or -2.75 minutes per month.

- Note:*
- 1 *The modified pulses are not observable on the frequency test (FT) output, nor will the effect of the calibration be measurable real-time, due to the periodic nature of the error compensation.*
 - 2 *Positive digital calibration is performed on an eight minute cycle, therefore the value in the calibration register should not be modified more frequently than once every eight minutes for positive values of calibration. Negative digital calibration is performed on a sixteen minute cycle, therefore negative values in the calibration register should not be modified more frequently than once every sixteen minutes.*

Table 4. Digital calibration values

Calibration value (binary)	Calibration value rounded to the nearest ppm	
	Negative calibration (DCS = 0)	Positive calibration (DCS = 1)
DC4 – DC0		
0 (00000)	0	0
1 (00001)	-2	4
2 (00010)	-4	8
3 (00011)	-6	12
4 (00100)	-8	16
5 (00101)	-10	20
6 (00110)	-12	24
7 (00111)	-14	28
8 (01000)	-16	33
9 (01001)	-18	37
10 (01010)	-20	41
11 (01011)	-22	45
12 (01100)	-24	49
13 (01101)	-26	53
14 (01110)	-28	57
15 (01111)	-31	61
16 (10000)	-33	65
17 (10001)	-35	69
18 (10010)	-37	73
19 (10011)	-39	77
20 (10100)	-41	81
21 (10101)	-43	85
22 (10110)	-45	90
23 (10111)	-47	94
24 (11000)	-49	98
25 (11001)	-51	102
26 (11010)	-53	106
27 (11011)	-55	110
28 (11100)	-57	114
29 (11101)	-59	118
30 (11110)	-61	122
31 (11111)	-63	126
N	N/491520 (per minute)	N/245760 (per minute)

3.4.2 Analog calibration (programmable load capacitance)

A second method of calibration employs the use of programmable internal load capacitors to adjust (or trim) the oscillator frequency.

By design, the oscillator is intended to be 0 ppm ± crystal accuracy at room temperature (25 °C, see [Figure 11 on page 25](#)). For a 12.5 pF crystal, the default loading on each side of the crystal will be 25 pF. For incrementing or decrementing the calibration value, capacitance will be added or removed in increments of 0.25 pF to each side of the crystal.

Internally, C_{LOAD} of the oscillator is changed via two digitally controlled capacitors, C_{XI} and C_{XO} , connected from the XI and XO pins to ground (see [Figure 10 on page 21](#)). The effective on-chip series load capacitance, C_{LOAD} , ranges from 3.5 pF to 17.4 pF, with a nominal value of 12.5 pF (AC0-AC6 = '0').

The effective series load capacitance (C_{LOAD}) is the combination of C_{XI} and C_{XO} :

$$C_{LOAD} = 1 / (1 / C_{XI} + 1 / C_{XO})$$

Seven analog calibration bits, AC0 to AC6, are provided in order to adjust the on-chip load capacitance value for frequency compensation of the RTC. Each bit has a different weight for capacitance adjustment. An analog calibration sign (ACS) bit determines if capacitance is added (ACS bit = '0,' negative calibration) or removed (ACS bit = '1,' positive calibration). The majority of the calibration adjustment is positive (i.e. to increase the oscillator frequency by removing capacitance) due to the typical characteristic of quartz crystals to slow down due to changes in temperature, but negative calibration is also available.

Since the analog calibration register adjustment is essentially "pulling" the frequency of the oscillator, the resulting frequency changes will not be linear with incremental capacitance changes. The equations which govern this mechanism indicate that smaller capacitor values of analog calibration adjustment will provide larger increments. Thus, the larger values of analog calibration adjustment will produce smaller incremental frequency changes. These values typically vary from 6-10 ppm/bit at the low end to <1 ppm/bit at the highest capacitance settings. The range provided by the analog calibration register adjustment with a typical surface mount crystal is approximately ±30 ppm around the AC6-AC0 = 0 default setting because of this property (see [Table 5 on page 25](#)).

Figure 11. Crystal accuracy across temperature

Table 5. Analog calibration values

Addr	Analog calibration value	D7	D6	D5	D4	D3	D2	D1	D0	C _{XI} , C _{XO}	C _{LOAD} ⁽¹⁾
		ACS (±)	AC6 (16 pF)	AC5 (8 pF)	AC4 (4 pF)	AC3 (2 pF)	AC2 (1 pF)	AC1 (0.5 pF)	AC0 (0.25 pF)		
12h	0 pF	x	0	0	0	0	0	0	0	25 pF	12.5 pF
	3 pF	0	0	0	0	1	1	0	0	28 pF	14 pF
	5 pF	0	0	0	1	0	1	0	0	30 pF	15 pF
	-7 pF	1	0	0	1	1	1	0	0	18 pF	9 pF
	9.75 pF ⁽²⁾	0	0	1	0	0	1	1	1	34.75 pF	17.4 pF
	-18 pF ⁽³⁾	1	1	0	0	1	0	0	0	7 pF	3.5 pF

1. C_{LOAD} = 1/(1/C_{XI} + 1/C_{XO})

2. Maximum negative calibration value

3. Maximum positive calibration value

The on-chip capacitance can be calculated as follows:

$$C_{LOAD} = [(AC6 - AC0 \text{ value, decimal}) \times 0.25\text{pF}] + 7\text{pF}$$

For example:

$$C_{LOAD} (12h = x0000000) = 12.5 \text{ pF}$$

$$C_{LOAD} (12h = 11001000) = 3.5 \text{ pF and}$$

$$C_{LOAD} (12h = 00100111) = 17.4 \text{ pF}$$

The oscillator sees a minimum of 3.5 pF with no programmable load capacitance selected.

Note: These are typical values, and the total load capacitance seen by the crystal will include approximately 1-2 pF of package and board capacitance in addition to the analog calibration register value.

Any invalid value of analog calibration will result in the default capacitance of 25 pF.

The combination of analog and digital trimming can give up to -93 to +156 ppm of the total adjustment.

Figure 12 represents a typical curve of clock ppm adjustment versus the Analog Calibration value. This curve may vary with different crystals, so it is good practice to evaluate the crystal to be used with an M41T93 device before establishing the adjustment values for the application in question.

Figure 12. Clock accuracy vs. on-chip load capacitors

Two methods are available for ascertaining how much calibration a given M41T93 may require:

- The first involves setting the clock, letting it run for a month and comparing it to a known accurate reference and recording deviation over a fixed period of time. This allows the designer to give the end user the ability to calibrate the clock as the environment requires, even if the final product is packaged in a non-user serviceable enclosure. The designer could provide a simple utility that accesses either or both of the calibration bytes.
- The second approach is better suited to a manufacturing environment, and involves the use of the $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$ pin. The $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$ pin will toggle at 512 Hz when FT and OUT bits = '1' and ST = '0.' Any deviation from 512 Hz indicates the degree and direction of oscillator frequency shift at the test temperature. For example, a reading of 512.010124 Hz would indicate a +20 ppm oscillator frequency error, requiring either a -10 (xx001010) to be loaded into the digital calibration byte, or +6 pF (00011000) into the analog calibration byte for correction.

Note: Setting or changing the digital calibration byte does not affect the frequency test, square wave, or watchdog timer frequency, but changing the analog calibration byte DOES affect all functions derived from the low current oscillator (see [Figure 13](#)).

Figure 13. Clock divider chain and calibration circuits

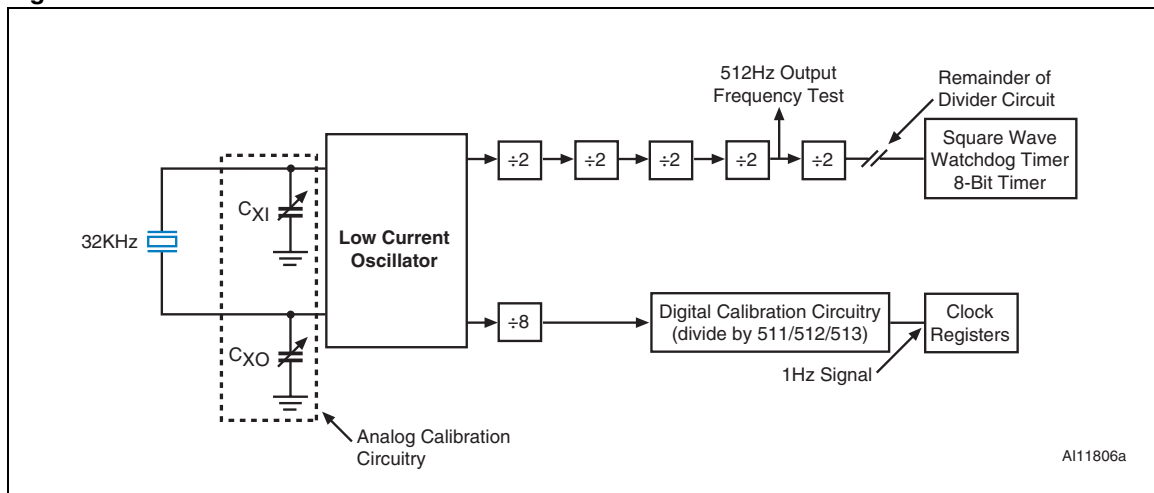

Figure 14. Crystal isolation example

Note: The substrate pad should be tied to V_{SS} .

3.5 Setting the alarm clock registers

Address locations 0Ah-0Eh (alarm 1) and 14h-18h (alarm 2) contain the alarm settings. Either alarm can be configured independently to go off at a prescribed time on a specific month, date, hour, minute, or second, or repeat every year, month, day, hour, minute, or second. Bits RPT15–RPT11 and RPT25–RPT21 put the alarms in the repeat mode of operation. [Table 6 on page 29](#) shows the possible bit configurations.

Codes not listed in the table default to the once-per-second mode to quickly alert the user of an incorrect alarm setting. When the clock information matches the alarm clock settings based on the match criteria defined by RPT15–RPT11 and/or RPT25–RPT21, AF1 (alarm 1 flag) or AF2 (alarm 2 flag) is set. If A1IE (alarm 1 interrupt enable) is set, the alarm condition activates the $\overline{IRQ}/FT/OUT$ output pin. To disable either of the alarms, write a '0' to the alarm date registers and to the RPTx5–RPTx1 bits.

Note: If the address pointer is allowed to increment to the flag register address, or the last address written is "Alarm Seconds," the address pointer will increment to the flag address, and an alarm condition will not cause the interrupt/flag to occur until the address pointer is moved to a different address.

The \overline{IRQ} output is cleared by a READ to the flags register (0Fh) as shown in [Figure 15](#). A subsequent READ of the flags register is necessary to see that the value of the alarm flag has been reset to '0'.

The $\overline{IRQ}/FT/OUT$ pin can also be activated in the battery backup mode (see [Figure 16 on page 29](#)).

3.6 Optional second programmable alarm

When the alarm 2 enable (AL2E) bit (D1 of address 13h) is set to a logic '1,' registers 14h through 18h provide control for a second programmable alarm which operates in the same manner as the alarm function described above.

The AL2E bit defaults on initial power-up to a logic '0' (alarm 2 disabled). In this mode, the five address bytes (14h-18h) function as additional user SRAM, for a total of 12 bytes of user SRAM.

Figure 15. Alarm interrupt reset waveform

Figure 16. Backup mode alarm waveform

Note: *ABE and A1IE bits = 1.*

Table 6. Alarm repeat modes

RPT5	RPT4	RPT3	RPT2	RPT1	Alarm setting
1	1	1	1	1	Once per second
1	1	1	1	0	Once per minute
1	1	1	0	0	Once per hour
1	1	0	0	0	Once per day
1	0	0	0	0	Once per month
0	0	0	0	0	Once per year

3.7 Watchdog timer

The watchdog timer can be used to detect an out-of-control microprocessor. The user programs the watchdog timer by setting the desired amount of time-out into the watchdog register, address 09h. Bits BMB4-BMB0 store a binary multiplier and the two lower order bits RB1-RB0 select the resolution, where 00 = 1/16 second, 01 = 1/4 second, 10 = 1 second, and 11 = 4 seconds. The amount of time-out is then determined to be the multiplication of the five-bit multiplier value with the resolution. (For example: writing 00001110 in the watchdog register = 3×1 , or 3 seconds). If the processor does not reset the timer within the specified period, the M41T93 sets the WDF (watchdog flag) and generates a watchdog interrupt.

The watchdog timer can be reset by having the microprocessor perform a WRITE of the watchdog register. The time-out period then starts over.

Should the watchdog timer time-out, a value of 00h needs to be written to the watchdog register in order to clear the $\overline{\text{IRQ/FT/OUT}}$ pin. This will also disable the watchdog function until it is again programmed correctly. A READ of the flags register will reset the watchdog flag (bit D7; register 0Fh).

The watchdog function is automatically disabled upon power-up and the watchdog register is cleared. If the watchdog function is set, the frequency test function is activated, and the SQWE bit is '0,' the watchdog function prevails and the frequency test function is denied.

3.8 8-bit (countdown) timer

The timer value register is an 8-bit binary countdown timer. It is enabled and disabled via the timer control register (11h) TE bit. Other timer properties such as the source clock, or interrupt generation are also selected in the timer control register (see [Table 7](#)). For accurate read back of the countdown value, the serial clock (SCL) must be operating at a frequency of at least twice the selected timer clock.

The timer control register selects one of four source clock frequencies for the timer (4096, 64, 1, or 1/60 Hz), and enables/disables the timer. The timer counts down from a software-loaded 8-bit binary value. At the end of every countdown, the timer sets the timer flag (TF) bit. The TF bit can only be cleared by software. When asserted, the timer flag (TF) can also be used to generate an interrupt ($\overline{\text{IRQ/FT/OUT}}$) on the M41T93. The interrupt may be generated as a pulsed signal every countdown period or as a permanently active signal which follows the condition of TF. The timer interrupt/timer pulse ($\overline{\text{TI/TP}}$) bit is used to control this mode selection. When reading the timer, the current countdown value is returned.

Table 7. Timer control register map

Addr	D7	D6	D5	D4	D3	D2	D1	D0	Function
0Fh	WDF	AF1	AF2	BL	TF	OF	0	0	Flags
10h	Timer countdown value								Timer value
11h	TE	$\overline{\text{TI/TP}}$	TIE	0	0	0	TD1	TD0	Timer control

Note: Bit positions labeled with '0' should always be written with logic '0.'

3.8.1 \overline{TI}/TP

- $\overline{TI}/TP = 0$
 $\overline{IRQ}/FT/OUT$ is active when TF is logic '1' (subject to the status of the timer interrupt enable bit (TIE)).
- $\overline{TI}/TP = 1$
 $\overline{IRQ}/FT/OUT$ pulses active according to [Table 8](#) (subject to the status of the TIE bit).

Note: If an alarm condition, watchdog time-out, oscillator failure, or $OUT = 0$ cause $\overline{IRQ}/FT/OUT$ to be asserted low, then $\overline{IRQ}/FT/OUT$ will remain asserted even if \overline{TI}/TP is set to '1.' When in pulse mode ($\overline{TI}/TP = 1$), clearing the TF bit will not stop the pulses on $\overline{IRQ}/FT/OUT$. The output pulses will only stop if TE, TIE, or \overline{TI}/TP are reset to '0.'

Table 8. Interrupt operation (bit $\overline{TI}/TP = 1$)

Source clock (Hz)	$\overline{IRQ}^{(1)}$ period(s)	
	$n^{(2)} = 1$	$n > 1$
4096	1/8192	1/4096
64	1/128	1/64
1	1/64	1/64
1/60	1/64	1/64

1. TF and $\overline{IRQ}/FT/OUT$ become active simultaneously.
2. $n =$ loaded countdown timer value. The timer is stopped when $n = 0$.

3.8.2 TF

At the end of a timer countdown, TF is set to logic '1.' If both timer and alarm interrupts are required in the application, the source of the interrupt can be determined by reading the flag bits. The timer will auto-reload and continue to count down regardless of the state of TF bit (or \overline{TI}/TP bit). The TF bit is cleared by reading the flags register.

3.8.3 TIE

In level mode ($\overline{TI}/TP = 0$), when TF is asserted, the interrupt is asserted (if TIE = 1). To clear the interrupt, the TF bit or the TIE bit must be reset.

3.8.4 TE

- TE = 0
When the timer register (10h) is set to '0,' the timer is disabled.
- TE = 1
The timer is enabled. TE is reset (disabled) on power-down. When re-enabled, the counter will begin from the same value as when it was disabled.

3.8.5 TD1/0

These are the timer source clock frequency selection bits (see [Table 9](#)). These bits determine the source clock for the countdown timer (see [Table 10](#)). When not in use, the TD1 and TD0 bits should be set to '11' (1/60 Hz) for power saving.

Table 9. Timer source clock frequency selection (244.1 μ s to 4.25 hrs)

TD1	TD0	Timer source clock frequency (Hz)
0	0	4096 (244.1 μ s)
0	1	64 (15.6 ms)
1	0	1 (1 s)
1	1	1/60 (60 s)

Table 10. Timer countdown value register bits (addr 11h)

Bit	Symbol	Description
7 - 0	<timer countdown value>	This register holds the loaded countdown value 'n.' Countdown period = n / source clock frequency

Note: Writing to the timer register will not reset the TF bit or clear the interrupt.

3.9 Square wave output

The M41T93 offers the user a programmable square wave function which is output on the SQW pin. RS3-RS0 bits located in 13h establish the square wave output frequency. These frequencies are listed in [Table 11](#). Once the selection of the SQW frequency has been completed, the SQW pin can be turned on and off under software control with the square wave enable bit (SQWE) located in register 0Ah.

Note: If the SQWE bit is set to '1', and V_{CC} falls below the switchover (V_{SO}) voltage, the squarewave output will be disabled.

Table 11. Square wave output frequency

Square wave bits				Square wave	
RS3	RS2	RS1	RS0	Frequency	Units
0	0	0	0	None	–
0	0	0	1	32.768	kHz
0	0	1	0	8.192	kHz
0	0	1	1	4.096	kHz
0	1	0	0	2.048	kHz
0	1	0	1	1.024	kHz
0	1	1	0	512	Hz
0	1	1	1	256	Hz
1	0	0	0	128	Hz
1	0	0	1	64	Hz
1	0	1	0	32	Hz
1	0	1	1	16	Hz
1	1	0	0	8	Hz
1	1	0	1	4	Hz
1	1	1	0	2	Hz
1	1	1	1	1	Hz

3.10 Battery low warning

The M41T93 automatically performs battery voltage monitoring upon power-up and at factory-programmed time intervals of approximately 24 hours. The battery low (BL) bit, bit D4 of flags register 0Fh, will be asserted if the battery voltage is found to be less than approximately 2.5 V. The BL bit will remain asserted until completion of battery replacement and subsequent battery low monitoring tests, either during the next power-up sequence or the next scheduled 24-hour interval.

If a battery low is generated during a power-up sequence, this indicates that the battery is below approximately 2.5 volts and may not be able to maintain data integrity. Clock data should be considered suspect and verified as correct. A fresh battery should be installed.

If a battery low indication is generated during the 24-hour interval check, this indicates that the battery is near end of life. However, data is not compromised due to the fact that a nominal V_{CC} is supplied. In order to insure data integrity during subsequent periods of battery backup mode, the battery should be replaced.

The M41T93 only monitors the battery when a nominal V_{CC} is applied to the device. Thus applications which require extensive durations in the battery backup mode should be powered-up periodically (at least once every few months) in order for this technique to be beneficial. Additionally, if a battery low is indicated, data integrity should be verified upon power-up via a checksum or other technique.

3.11 Century bits

These two bits will increment in a binary fashion at the turn of the century, and handle all leap years correctly. See [Table 12](#) for additional explanation.

Table 12. Century bits examples

CB0	CB1	Leap Year?	Example ⁽¹⁾
0	0	Yes	2000
0	1	No	2100
1	0	No	2200
1	1	No	2300

1. Leap year occurs every four years (for years evenly divisible by four), except for years evenly divisible by 100. The only exceptions are those years evenly divisible by 400 (the year 2000 was a leap year, year 2100 is not).

3.12 Output driver pin

When the OFIE bit, A1IE bit, and watchdog register are not set to generate an interrupt, the $\overline{IRQ}/FT/OUT$ pin becomes an output driver that reflects the contents of D7 of register 08h. In other words, when D7 (OUT bit) is a '0,' then the $\overline{IRQ}/FT/OUT$ pin will be driven low.

Note: The $\overline{IRQ}/FT/OUT$ pin is an open drain which requires an external pull-up resistor.

3.13 Oscillator fail detection

If the oscillator fail (OF) bit is internally set to a '1,' this indicates that the oscillator has either stopped, or was stopped for some period of time and can be used to judge the validity of the clock and date data. This bit will be set to '1' any time the oscillator stops.

In the event the OF bit is found to be set to '1' at any time other than the initial power-up, the STOP bit (ST) should be written to a '1,' then immediately reset to '0.' This will restart the oscillator. The following conditions can cause the OF bit to be set:

- The first time power is applied (defaults to a '1' on power-up).

Note: If the OF bit cannot be written to '0' four seconds after the initial power-up, the STOP bit (ST) should be written to a '1,' then immediately reset to '0.'

- The voltage present on VCC or battery is insufficient to support oscillation
- The ST bit is set to '1.'
- External interference of the crystal

For the M41T93, if the oscillator fail interrupt enable bit (OFIE) is set to a '1,' the $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$ pin will also be activated. The $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$ output is cleared by resetting the OFIE or OF bit to '0' (NOT by reading the flag register).

The OF bit will remain set to '1' until written to logic '0.' The oscillator must start and have run for at least 4 seconds before attempting to reset the OF bit to '0.' If the trigger event occurs during a power down condition, this bit will be set correctly.

3.14 Oscillator fail interrupt enable

If the oscillator fail interrupt bit (OFIE) is set to a '1,' the $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$ pin will also be activated. The $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$ output is cleared by resetting the OFIE or OF bit to '0' (not by reading the flags register).

3.15 Initial power-on defaults

Upon initial application of power to the device, the register bits will initially power-on in the state indicated in [Table 13](#) and [Table 14](#).

Table 13. Initial power-on default values (part 1)

Condition ⁽¹⁾	ST	CB1	CB0	OUT	FT	DCS ACS	Digital calib.	Analog calib.	OFIE	Watchdog ⁽²⁾	A1IE	SQWE	ABE
Initial power-up	0	0	0	1	0	0	0	0	0	0	0	1	0
Subsequent power-up ⁽³⁾⁽⁴⁾	UC	UC	UC	UC	0	UC	UC	UC	UC	0	UC	UC	UC

1. All other control bits power-up in an undetermined state
2. BMB0-BMB4, RB0, RB1
3. With battery backup
4. UC = Unchanged

Table 14. Initial power-up default values (part 2)

Condition ⁽¹⁾	RPT11-15	HT	OF	TE	T̄I/TP	TIE	TD1	TD0	RS0	RS1-3	OTP	RPT21-25	AL2E
Initial power-up	0	1	1	0	0	0	1	1	1	0	0	0	0
Subsequent power-up ⁽²⁾⁽³⁾	UC	1	UC	0	UC	UC	UC	UC	UC	UC	UC	UC	UC

1. All other control bits power-up in an undetermined state
2. With battery backup
3. UC = Unchanged

3.16 OTP bit operation (SOX18 package only)

When the OTP (one time programmable) bit is set to a '1,' the value in the internal OTP registers will be transferred to the analog calibration register (12h) and are "read only." The OTP value is programmed by the manufacturer, and will contain the calibration value necessary to achieve ± 5 ppm at room temperature after two SMT reflows. This clock accuracy can be guaranteed to drift no more than ± 3 ppm the first year, and ± 1 ppm for each following year due to crystal aging.

If the OTP bit is set to '0,' the analog calibration register will become a WRITE/READ register and function like standard SRAM memory cells, allowing the user to implement any desired value of analog calibration.

When the user sets the OTP bit, they need to wait for approximately 8 ms before the analog registers transfer the value from the OTP to the analog registers due to the OTP read operation.

4 Maximum ratings

Stressing the device above the rating listed in the “absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 15. Absolute maximum ratings

Symbol	Parameter	Value ⁽¹⁾	Unit	
T _{STG}	Storage temperature (V _{CC} off, oscillator off)	–55 to 125	°C	
V _{CC}	Supply voltage	–0.3 to 7.0	V	
T _{SLD} ⁽²⁾	Lead solder temperature for 10 seconds	QFN16	260	°C
		SOX18	245	°C
V _{IO}	Input or output voltages	–0.2 to V _{CC} +0.3	V	
I _O	Output current	20	mA	
P _D	Power dissipation	1	W	

1. Data based on characterization results, not tested in production.
2. Reflow at peak temperature of 260 °C (total thermal budget not to exceed 245 °C for greater than 30 seconds).

5 DC and AC parameters

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC characteristic tables are derived from tests performed under the measurement conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 16. Operating and AC measurement conditions

Parameter	M41T93
Supply voltage (V_{CC})	2.38 V to 5.5 V
Ambient operating temperature (T_A)	-40 to +85 °C
Load capacitance (C_L , typical)	30 pF
Input rise and fall times	≤ 50 ns
Input pulse voltages	0.2 V_{CC} to 0.8 V_{CC}
Input and output timing ref. voltages	0.3 V_{CC} to 0.7 V_{CC}

Note: Output Hi-Z is defined as the point where data is no longer driven.

Figure 17. Measurement AC I/O waveform

Table 17. Capacitance

Symbol	Parameter ⁽¹⁾⁽²⁾	Min	Max	Unit
C_{IN}	Input capacitance	-	7	pF
$C_{OUT}^{(3)}$	Output capacitance	-	10	pF

1. Effective capacitance measured with power supply at 3.6 V; sampled only, not 100% tested
2. At 25 °C, f = 1 MHz
3. Outputs deselected

Table 18. DC characteristics

Sym	Parameter	Test condition ⁽¹⁾		Min	Typ	Max	Unit
V _{CC}	Operating voltage (S)	-40 to 85 °C		3.00		5.50	V
	Operating voltage (R)	-40 to 85 °C		2.70		5.50	V
	Operating voltage (Z)	-40 to 85 °C		2.38		5.50	V
I _{LI}	Input leakage current	0 V ≤ V _{IN} ≤ V _{CC}				±1	µA
I _{LO}	Output leakage current	0 V ≤ V _{OUT} ≤ V _{CC}				±1	µA
I _{CC1}	Supply current	f _{SCL} = 2 MHz				0.5	mA
	SCL = 0.1V _{CC} /0.9V _{CC}	f _{SCL} = 5 MHz				1.0	mA
	SDO = open	f _{SCL} = 10 MHz				2.0	mA
I _{CC2}	Supply current (standby)	$\bar{E} = V_{CC};$	5.5 V		8	10	µA
		All inputs ≥ V _{CC} - 0.2 V; ≤ V _{SS} + 0.2 V	3.0 V		6.5		µA
V _{IL}	Input low voltage			-0.3		0.3V _{CC}	V
V _{IH}	Input high voltage			0.7V _{CC}		V _{CC} +0.3	V
V _{OL}	Output low voltage	$\overline{RST}, FT/\overline{RST}$	V _{CC} /V _{BAT} = 3.0 V, I _{OL} = 1.0 mA			0.4	V
		SQW, $\overline{IRQ}/FT/OUT$	V _{CC} = 3.0 V, I _{OL} = 1.0 mA			0.4	V
		SDO	V _{CC} = 3.0 V, I _{OL} = 3.0 mA			0.4	V
V _{OH}	Output high voltage	V _{CC} = 3.0 V, I _{OH} = -1.0 mA (push-pull)		2.4			V
	Pull-up supply voltage (open drain)	$\overline{IRQ}/FT/OUT$				5.5	V
V _{BAT}	Backup supply voltage			1.8		5.5	V
I _{BAT}	Battery supply current	25 °C; V _{CC} = 0 V; OSC on; V _{BAT} = 3 V; 32 KHz off			365	450	nA

1. Valid for ambient operating temperature: T_A = -40 to 85 °C; V_{CC} = 2.38 V to 5.5 V (except where noted)

Figure 18. I_{CC2} vs. temperature

Table 19. Crystal electrical characteristics

Symbol	Parameter ⁽¹⁾⁽²⁾	Min	Typ	Max	Units
f_O	Resonant frequency	-	32.768		kHz
R_S	Series resistance	-		65 ⁽³⁾	k Ω
C_L	Load capacitance	-	12.5		pF

- Externally supplied if using the QFN16 package. STMicroelectronics recommends the Citizen CFS-145 (1.5 x 5 mm) and the KDS DT-38 (3 x 8 mm) for thru-hole, or the KDS DMX-26S (3.2 x 8 mm) or Micro Crystal MS3V-T1R (1.5 x 5 mm) for surface-mount, tuning fork-type quartz crystals. For contact information, see [Section 8: References on page 49](#).
- Load capacitors are integrated within the M41T93. Circuit board layout considerations for the 32.768 kHz crystal of minimum trace lengths and isolation from RF generating signals should be taken into account.
- Guaranteed by design.

Table 20. Oscillator characteristics

Symbol	Parameter ⁽¹⁾⁽²⁾	Conditions	Min	Typ	Max	Units
V_{STA}	Oscillator start voltage	≤ 4 s	2.0			V
t_{STA}	Oscillator start time	$V_{CC} = V_{SO}$			1	s
C_{XI}, C_{XO} ⁽¹⁾	Capacitor input, capacitor output			25		pF
	IC-to-IC frequency variation ⁽²⁾⁽³⁾		-10		+10	ppm

- With default analog calibration value (= 0)
- Reference value
- $T_A = 25$ °C, $V_{CC} = 5.0$ V

Figure 19. Power down/up mode AC waveforms

Table 21. Power down/up trip points DC characteristics

Sym	Parameter ⁽¹⁾⁽²⁾	Min	Typ	Max	Unit	
V _{RST}	Reset threshold voltage	S	2.85	2.93	3.0	V
		R	2.55	2.63	2.7	V
		Z	2.25	2.32	2.38	V
V _{SO}	Battery backup switchover	V _{RST}			V	
	Hysteresis	25			mV	
t _{rec}	Reset pulse width (V _{CC} rising)	140		280	ms	
	V _{CC} to reset delay, V _{CC} = (V _{RST} + 100 mV), falling to (V _{RST} - 100 mV; for V _{CC} slew rate of 10 mV/μs		2.5		μs	

1. All voltages referenced to V_{SS}

2. Valid for ambient operating temperature: T_A = -40 to 85 °C; V_{CC} = 2.38 to 5.5 V (except where noted)

Figure 20. Input timing requirements

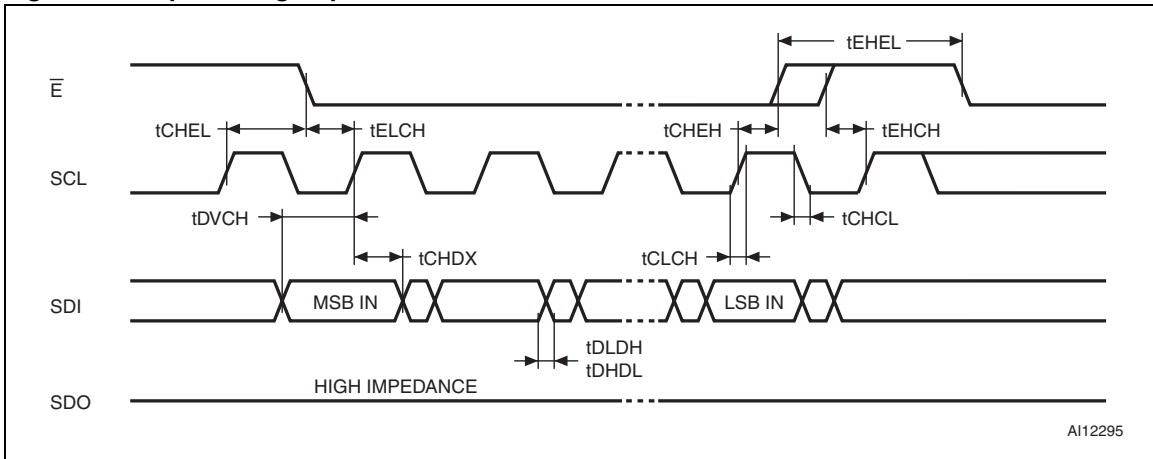

Figure 21. Output timing requirements

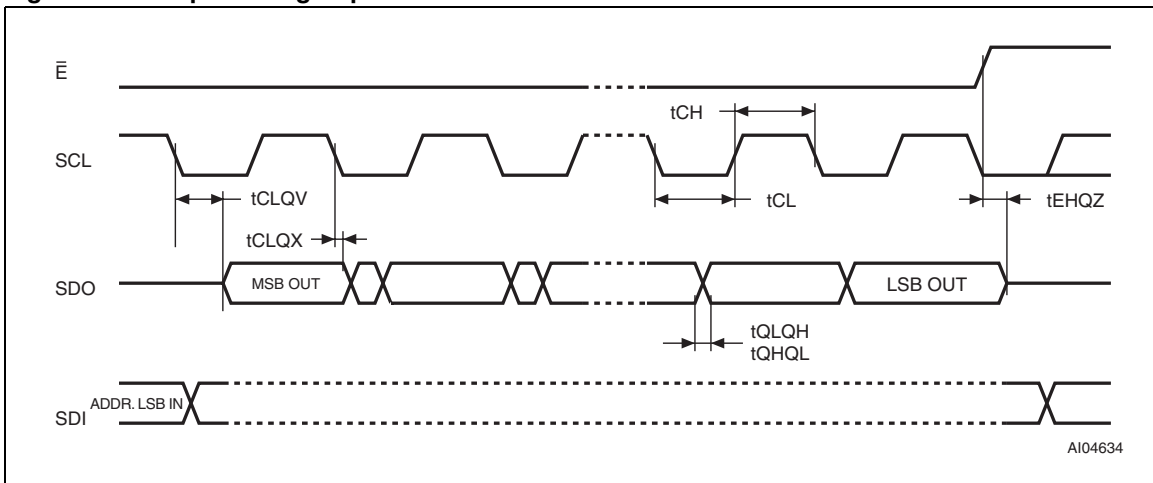

Table 22. AC characteristics

Sym	Parameter ⁽¹⁾	V _{CC} < 2.7 V		V _{CC} ≥ 2.7 V		Units
		Min	Max	Min	Max	
f _{SCL}	SCL clock frequency	D.C.	5	D.C.	10	MHz
t _{ELCH}	\bar{E} active setup time	90		30		ns
t _{EHCH}	\bar{E} not active setup time	90		30		ns
t _{EHEL}	\bar{E} deselect time	100		40		ns
t _{CHEH}	\bar{E} active hold time	90		30		ns
t _{CHEL}	\bar{E} not active hold time	90		30		ns
t _{CH} ⁽²⁾	Clock high time	90		40		ns
t _{CL} ⁽²⁾	Clock low time	90		40		ns
t _{CLCH} ⁽³⁾	Clock rise time		1		2	μs
t _{CHCL} ⁽³⁾	Clock fall time		1		2	μs
t _{DVCH}	Data in setup time	20		10		ns
t _{CHDX}	Data in hold time	30		10		ns
t _{EHQZ} ⁽³⁾	Output disable time		100		40	ns
t _{CLQV}	Clock low to output valid		60		40	ns
t _{CLQX}	Output hold time	0		0		ns
t _{QLQH} ⁽³⁾	Output rise time		50		40	ns
t _{QHQL} ⁽³⁾	Output fall time		50		40	ns

1. Valid for ambient operating temperature: T_A = -40 to 85 °C; V_{CC} = 2.38 to 5.5 V (except where noted)
2. t_{CH} and t_{CL} must never be lower than the shortest possible clock period, 1/f_{C(max)}
3. Value guaranteed by characterization, not 100% tested in production

6 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.

9 Revision history

Table 26. Document revision history

Date	Revision	Changes
07-Aug-2006	1	Initial release.
08-May-2007	2	Document status upgraded to full datasheet; updated Figure 12: Clock accuracy vs. on-chip load capacitors ; Section 3.16 ; Section 3.4.1 ; Table 1 , 15 , and 18 , Figure 3 and 24 ; added Figure 18: I_{CC2} vs. temperature . Micro Crystal information added (Table 19).
22-Oct-2007	3	Updated Features on cover page; minor formatting changes; modified footnote 1 in Table 19 ; added Section 8: References .
15-Aug-2008	4	Removed references to SPI bus mode 3 operation (updated cover page, Figure 5 , 6 , Section 1.1.3 , Section 2.1); minor formatting changes.
19-Oct-2010	5	Updated Note in Section 3.13: Oscillator fail detection ; updated ECOPACK [®] text in Section 6: Package mechanical data ; reformatted document.
12-Oct-2011	6	Updated Features , title, Section 3.1: Clock data coherency , Section 3.2: Halt bit (HT) operation ; added Figure 9 , added footnote 2 to Table 25: Ordering information .

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY TWO AUTHORIZED ST REPRESENTATIVES, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
