

CY7C147

4K x 1 Static RAM

Features

- Automatic power-down when deselected
- CMOS for optimum speed/power
- High speed
— 25 ns
- Low active power
— 440 mW (commercial)
— 605 mW (military)
- Low standby power
— 55 mW
- TTL-compatible inputs and outputs

- Capable of withstanding greater than 2001V electrostatic discharge

Functional Description

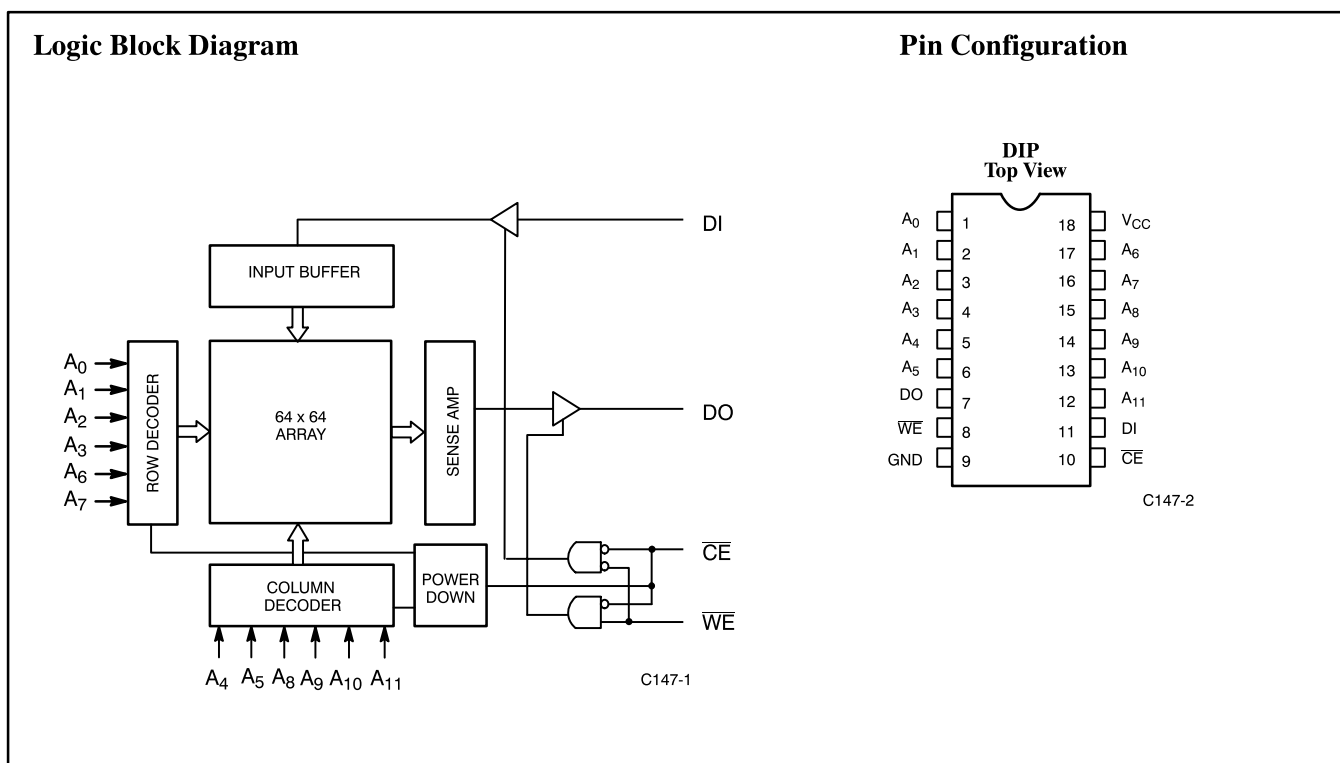

The CY7C147 is a high-performance CMOS static RAMs organized as 4096 words by 1 bit. Easy memory expansion is provided by an active LOW chip enable (CE) and three-state drivers. The CY7C147 has an automatic power-down feature, reducing the power consumption by 80% when deselected.

Writing to the device is accomplished when the chip select (CE) and write enable

(WE) inputs are both LOW. Data on the input pin (DI) is written into the memory location specified on the address pins (A₀ through A₁₁).

Reading the device is accomplished by taking the chip enable (CE) LOW while (WE) remains HIGH. Under these conditions, the contents of the location specified on the address pins will appear on the data output (DO) pin.

The output pin remains in a high-impedance state when chip enable is HIGH, or write enable (WE) is LOW.

Selection Guide

		7C147-25	7C147-35	7C147-45
Maximum Access Time (ns)	Commercial	25	35	45

Capacitance^[5]

Parameter	Description	Test Conditions	Max.	Unit
C _{IN}	Input Capacitance	T _A = 25°C, f = 1 MHz, V _{CC} = 5.0V	8	pF
C _{OUT}	Output Capacitance		8	pF

Notes:

1. T_A is the "instant on" case temperature.
2. See the last page of this specification for Group A subgroup testing information.
3. Duration of the short circuit should not exceed 30 seconds.
4. A pull-up resistor to V_{CC} on the \overline{CE} input is required to keep the device deselected during V_{CC} power-up, otherwise I_{SB} will exceed values given.
5. Tested initially and after any design or process changes that may affect these parameters.

t _{HZWE}	\overline{WE} LOW to High Z ^[7, 8]		15		20		25	ns

Notes:

- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- At any given temperature and voltage condition, t_{HZ} is less than t_{LZ} for all devices.
- t_{HZCE} and t_{HZWE} are tested with C_L = 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady state voltage.
- The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
