

Rad Hard Dual 36V Precision Single-Supply, Rail-to-Rail Output, Low-Power Operational Amplifiers

ISL70218SEH

The ISL70218SEH is a dual, low-power precision amplifier optimized for single-supply applications. This op amp features a common mode input voltage range extending to 0.5V below the V- rail, a rail-rail differential input voltage range, and rail-to-rail output voltage swing, which makes it ideal for single-supply applications where input operation at ground is important.

This op amp features low power, low offset voltage, and low temperature drift, making it ideal for applications requiring both high DC accuracy and AC performance. This amplifier is designed to operate over a single supply range of 3V to 36V or a split supply voltage range of +1.8V/-1.2V to ±18V. The combination of precision and small footprint provides the user with outstanding value and flexibility relative to similar competitive parts.

Applications for this amplifier include precision instrumentation, data acquisition and precision power supply controls.

The ISL70218SEH is available in a 10 lead hermetic ceramic flatpack and operates over the extended temperature range of -55 °C to +125 °C.

Features

- DLA SMD# [5962-12222](#)
- Wide Single and Dual Supply Range 3V to 42V, Abs. Max.
- Low Current Consumption 850µA, Typ.
- Low Input Offset Voltage 40µV, Typ.
- Rail-to-Rail Output <10mV
- Rail-to-Rail Input Differential Voltage Range for Comparator Applications
- Operating Temperature Range -55 °C to +125 °C
- Below-ground (V-) Input Capability to -0.5V
- Low Noise Voltage 5.6nV/√Hz, Typ.
- Low Noise Current 355fA/√Hz, Typ.
- Offset Voltage Temperature Drift 0.3µV/°C, Typ.
- No Phase Reversal
- Radiation Tolerance
 - SEL/SEB LET_{TH} (V_S = ±18V) 86.4 MeV * cm²/mg
 - High Dose Rate 100krad(Si)
 - Low Dose Rate 100krad(Si)

* Product capability established by initial characterization. The EH version is acceptance tested on a wafer by wafer basis to 50krad(Si) at low dose rate.

Applications

- Precision Instruments
- Active Filter Blocks
- Data Acquisition
- Power Supply Control

NOTES:

- These Intersil Pb-free Hermetic packaged products employ 100% Au plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations.
- For Moisture Sensitivity Level (MSL), please see device information page for [ISL70218SEH](#). For more information on MSL, please see Tech Brief [TB363](#).

ISL70218SEH

Absolute Maximum Ratings

Maximum Supply Voltage	42V
Maximum Supply Voltage (LET = 86.4 MeV • cm ² /mg)	36V
Maximum Differential Input Current	20mA
Maximum Differential Input Voltage	V ₋ - 0.5V to V ₊ + 0.5V
Min/Max Input Voltage	V ₋ - 0.5V to V ₊ + 0.5V
Max/Min Input Current	±20mA
Output Short-Circuit Duration (1 output at a time)	Indefinite
ESD Tolerance	
Human Body Model (Tested per MIL-PRF-883 3015.7)	2kV
Machine Model (Tested per JESD22-A115-A)	300V
Charged Device Model (Tested per CDM-22C10ID)	750V
Di-electrically Isolated PR40 Process	Latch-up free

Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
10 Ld Flatpack Package (Notes 3, 4)	130	20
Storage Temperature Range	-65°C to +150°C	
Pb-Free Reflow Profile	see link below http://www.intersil.com/pbfree/Pb-FreeReflow.asp	

Recommended Operating Conditions

Ambient Operating Temperature Range	-55°C to +125°C
Maximum Operating Junction Temperature	+150°C
Supply Voltage	3V (+1.8V/-1.2V) to 30V (±15V)

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- θ_{JA} is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.
- For θ_{JC} , the "case temp" location is the center of the package underside.

Applications Information

Functional Description

The ISL70218SEH is a dual, 3.2MHz, single or dual supply, rail-to-rail output amplifier with a common mode input voltage range extending to a range of 0.5V below the V- rail. The input stage is optimized for precision sensing of ground-referenced signals in single-supply applications. The input stage is able to handle large input differential voltages without phase inversion, making this amplifier suitable for high-voltage comparator applications. The bipolar design features high open loop gain and excellent DC input and output temperature stability. This op amp features very low quiescent current of 850µA, and low temperature drift. The device is fabricated in a new precision 40V complementary bipolar DI process and is immune from latch-up for up to a 36V supply range.

Operating Voltage Range

The op amp is designed to operate over a single supply range of 3V to 36V or a split supply voltage range of +1.8V/-1.2V to ±18V. The device is fully characterized at 30V (±15V). Both DC and AC performance remain virtually unchanged over the complete operating voltage range. Parameter variation with operating voltage is shown in the “Typical Performance Curves” beginning on page 8.

The input common mode voltage to the V+ rail (V+ - 1.8V over the full temperature range) may limit amplifier operation when operating from split V+ and V- supplies. Figure 4 shows the common mode input voltage range variation over temperature.

Input Stage Performance

The ISL70218SEH PNP input stage has a common mode input range extending up to 0.5V below ground at +25 °C. Full amplifier performance is guaranteed for input voltage down to ground (V-) over the -55 °C to +125 °C temperature range. For common mode voltages down to -0.5V below ground (V-), the amplifiers are fully functional, but performance degrades slightly over the full temperature range. This feature provides excellent CMRR, AC performance, and DC accuracy when amplifying low-level, ground-referenced signals.

The input stage has a maximum input differential voltage equal to a diode drop greater than the supply voltage and does not contain the back-to-back input protection diodes found on many similar amplifiers. This feature enables the device to function as a precision comparator by maintaining very high input impedance for high-voltage differential input comparator voltages. The high differential input impedance also enables the device to operate reliably in large signal pulse applications, without the need for anti-parallel clamp diodes required on MOSFET and most bipolar input stage op amps. Thus, input signal distortion caused by nonlinear clamps under high slew rate conditions is avoided.

In applications in which one or both amplifier input terminals is at risk of exposure to voltages beyond the supply rails, current-limiting resistors may be needed at each input terminal (see Figure 49, R_{IN+} , R_{IN-}) to limit current through the power-supply ESD diodes to 20mA.

FIGURE 49. INPUT ESD DIODE CURRENT LIMITING

Output Drive Capability

The bipolar rail-to-rail output stage features low saturation levels that enable an output voltage swing to less than 15mV when the total output load (including feedback resistance) is held below 50µA (Figures 21 and 22). With ±15V supplies, this can be achieved by using feedback resistor values >300kΩ.

The output stage is internally current limited. Output current limit over temperature is shown in Figures 23 and 24. The amplifiers can withstand a short circuit to either rail as long as the power dissipation limits are not exceeded. This applies to only one amplifier at a time for the dual op amp. Continuous operation under these conditions may degrade long-term reliability.

The amplifiers perform well when driving capacitive loads (Figures 45 and 46). The unity gain, voltage follower (buffer) configuration provides the highest bandwidth but is also the most sensitive to ringing produced by load capacitance found in BNC cables. Unity gain overshoot is limited to 35% at capacitance values to 0.33nF. At gains of 10 and higher, the device is capable of driving more than 10nF without significant overshoot.

Output Phase Reversal

Output phase reversal is a change of polarity in the amplifier transfer function when the input voltage exceeds the supply voltage. The ISL70218SEH is immune to output phase reversal out to 0.5V beyond the rail ($V_{ABS\ MAX}$) limit (Figure 38).

Single Channel Usage

The ISL70218SEH is a dual op amp. If the application requires only one channel, the user must configure the unused channel to prevent it from oscillating. The unused channel oscillates if the input and output pins are floating. This results in higher-than-expected supply currents and possible noise injection into the channel being used. The proper way to prevent oscillation is to short the output to the inverting input, and ground the positive input (Figure 50).

FIGURE 50. PREVENTING OSCILLATIONS IN UNUSED CHANNELS

Power Dissipation

It is possible to exceed the +150°C maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related using Equation 1:

$$T_{JMAX} = T_{MAX} + \theta_{JA} \times PD_{MAXTOTAL} \quad (EQ. 1)$$

where

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})
- T_{MAX} = Maximum ambient temperature
- θ_{JA} = Thermal resistance of the package

PD_{MAX} for each amplifier can be calculated using Equation 2:

$$PD_{MAX} = V_S \times I_{qMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \quad (EQ. 2)$$

where

- PD_{MAX} = Maximum power dissipation of one amplifier
- V_S = Total supply voltage
- I_{qMAX} = Maximum quiescent supply current of one amplifier
- V_{OUTMAX} = Maximum output voltage swing of the application
- R_L = Load resistance

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL70218SEH](http://intersil.com/ISL70218SEH)

To report errors or suggestions for this datasheet, please go to: www.intersil.com/askourstaff

FTIs are available from our website at: <http://rel.intersil.com/reports/search.php>

For additional products, see www.intersil.com/product_tree

Intersil products are manufactured, assembled and tested utilizing ISO9000 quality systems as noted in the quality certifications found at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab (dimension k) may be used to identify pin one.
2. If a pin one identification mark is used in addition to a tab, the limits of dimension k do not apply.
3. This dimension allows for off-center lid, meniscus, and glass overrun.
4. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness. The maximum limits of lead dimensions b and c or M shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
5. N is the maximum number of terminal positions.
6. Measure dimension S1 at all four corners.
7. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
8. Dimension Q shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension Q minimum shall be reduced by 0.0015 inch (0.038mm) maximum when solder dip lead finish is applied.
9. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
10. Controlling dimension: INCH.
