## 36V Rad Hard Dual Precision Operational Amplifier

## ISL70227SEH

The ISL70227SEH is a high precision dual operational amplifier featuring very low noise, low offset voltage, low input bias current and low temperature drift. These features plus its radiation tolerance make the ISL70227SEH the ideal choice for applications requiring both high DC accuracy and AC performance. The combination of precision, low noise, and small footprint provides the user with outstanding value and flexibility relative to similar competitive parts.

Applications for these amplifiers include precision and analytical instrumentation, active filters, and power supply controls.

The ISL70227SEH is available in a 10 lead hermetic ceramic flatpack and operates over the extended temperature range of $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## Applications

- Power Supply Control
- Industrial Controls
- Active Filter Blocks
- Data Acquisition

## Features

- Electrically Screened to DLA SMD\# 5962-12223
- Wide Supply Range .4.5V to 42V Max.
- Very Low Voltage Noise . . . . . . . . . . . . . . . . . . 2.5nV/VHz, Typ.
- Gain-bandwidth Product . . . . . . . . . . . . . . . . . . . . . . . . . 10MHz
- Superb Offset Drift . . . . . . . . . . . . . . . . . . . . . . . . . $1 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$, Max
- Operating Temperature Range. . . . . . . . . . . $55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
- Low Input Voltage Offset. . . . . . . . . . . . . . . . . . . . . . . 10رV, Typ.
- Input Bias Current . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1nA, Typ.
- Unity Gain Stable
- No Phase Reversal
- Radiation Tolerance
- SEL/SEB LET ${ }_{\text {TH }}$. . . . . . . . . . . . . . . . . . . . . . . $86 \mathrm{MeV} \cdot \mathrm{cm}^{2} / \mathrm{mg}$
- High Dose Rate. 100krad(Si)
- Low Dose Rate 100krad(Si)*
* Product capability established by initial characterization. The EH version is acceptance tested on a wafer by wafer basis to $50 \mathrm{krad}(\mathrm{Si})$ at low dose rate.

NOTES:

1. These Intersil Pb-free Hermetic packaged products employ $100 \%$ Au plate -e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations.
2. For Moisture Sensitivity Level (MSL), please see device information page for ISL70227SEH. For more information on MSL please see techbrief TB363.

## Thermal Information

## Recommended Operating Conditions

Ambient Operating Temperature Range . . . . . . . . . . . . . $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ Maximum Operating Junction Temperature . . . . . . . . . . . . . . . . $+150^{\circ} \mathrm{C}$ Supply Voltage
$4.5 \mathrm{~V}( \pm 2.25 \mathrm{~V})$ to $30 \mathrm{~V}( \pm 15 \mathrm{~V})$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.
NOTES:
3. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
4. For $\theta_{\mathrm{JC}}$, the "case temp" location is the center of the ceramic on the package underside.

Electrical Specifications $\mathrm{V}_{\mathrm{S}} \pm 15 \mathrm{~V}, \mathrm{~V}_{\mathrm{CM}}=0, \mathrm{~V}_{\mathrm{O}}=\mathrm{OV}, \mathrm{R}_{\mathrm{L}}=0$ pen, $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted. Boldface limits apply over the operating temperature range, $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## Applications Information

## Functional Description

The ISL70227SEH is a dual, low noise 10 MHz BW precision op amp fabricated in a new precision 40 V complementary bipolar DI process. A super-beta NPN input stage with input bias current cancellation provides low input bias current (1nA typical), low input offset voltage ( $10 \mu \mathrm{~V}$ typ), low input noise voltage $(3 \mathrm{nV} / \sqrt{ } \mathrm{Hz})$, and low $1 / \mathrm{f}$ noise corner frequency $(5 \mathrm{~Hz})$. These amplifiers also feature high open loop gain $(1500 \mathrm{~V} / \mathrm{mV})$ for excellent CMRR (120dB) and THD+N performance ( $0.0002 \%$ @ $3.5 \mathrm{~V}_{\text {RMS }}, 1 \mathrm{kHz}$ into $2 \mathrm{k} \Omega$ ). A complimentary bipolar output stage enables high capacitive load drive without external compensation.

## Operating Voltage Range

The devices are designed to operate over the $4.5 \mathrm{~V}( \pm 2.25 \mathrm{~V})$ to $36 \mathrm{~V}( \pm 18 \mathrm{~V})$ range and are fully characterized at $30 \mathrm{~V}( \pm 15 \mathrm{~V})$. Parameter variation with operating voltage is shown in the "Typical Performance Curves" beginning on page 9.

## Input ESD Diode Protection

The input terminals ( $\mathrm{IN}+$ and IN -) have internal ESD protection diodes to the positive and negative supply rails, and an additional anti-parallel diode pair across the inputs (see Figures 37 and 38).

FIGURE 37. INPUT ESD DIODE CURRENT LIMITING - UNITY GAIN
For unity gain applications (see Figure 37) where the output is connected directly to the non-inverting input a current limiting resistor ( $\mathrm{R}_{\text {IN }}$ ) will be needed under the following conditions to protect the anti-parallel differential input protection diodes.

- The amplifier input is supplied from a low impedance source.
- The input voltage rate-of-rise ( $\mathrm{dV} / \mathrm{dt}$ ) exceeds the maximum slew rate of the amplifier $( \pm 3.6 \mathrm{~V} / \mu \mathrm{s})$.
If the output lags far enough behind the input, the anti-parallel input diodes can conduct. For example, if an input pulse ramps from 0 V to +10 V in $1 \mu \mathrm{~s}$, then the output of the ISL70227SEH will reach only +3.6 V (slew rate $=3.6 \mathrm{~V} / \mu \mathrm{s}$ ) while the input is at 10 V , The input differential voltage of 6.4 V will force input ESD diodes to conduct, dumping the input current directly into the output stage and the load. The resulting current flow can cause permanent damage to the ESD diodes. The ESD diodes are rated to 20 mA , and in the previous example, setting $R_{\text {IN }}$ to 1 k resistor (see Figure 37) would limit the current to $<6.4 \mathrm{~mA}$, and provide additional protection up to $\pm 20 \mathrm{~V}$ at the input.
In applications where one or both amplifier input terminals are at risk of exposure to high voltage, current limiting resistors may be needed at each input terminal (see Figure $38 \mathrm{R}_{\mathrm{IN}}+, \mathrm{R}_{\mathrm{IN}}$ ) to limit current through the power supply ESD diodes to 20 mA .

FIGURE 38. INPUT ESD DIODE CURRENT LIMITING - DIFFERENTIAL INPUT

## Output Current Limiting

The output current is internally limited to approximately $\pm 45 \mathrm{~mA}$ at $+25^{\circ} \mathrm{C}$ and can withstand a short circuit to either rail as long as the power dissipation limits are not exceeded. This applies to only one amplifier at a time. Continuous operation under these conditions may degrade long term reliability.

## Output Phase Reversal

Output phase reversal is a change of polarity in the amplifier transfer function when the input voltage exceeds the supply voltage. The ISL70227SEH are immune to output phase reversal, even when the input voltage is 1 V beyond the supplies.

## Power Dissipation

It is possible to exceed the $+150^{\circ} \mathrm{C}$ maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature ( $\mathrm{T}_{\text {JMAX }}$ ) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related using Equation 1:
$\mathbf{T}_{\text {JMAX }}=\mathbf{T}_{\text {MAX }}+\theta_{\text {JA }} \times$ PD $_{\text {MAXTOTAL }}$
where:

- $P_{\text {dmaxtotal }}$ is the sum of the maximum power dissipation of each amplifier in the package ( $\mathrm{PD}_{\text {MAX }}$ )
- PD $_{\text {MAX }}$ for each amplifier can be calculated using Equation 2:
$P D_{\text {MAX }}=v_{S_{S}} \times I_{\text {qMAX }}+\left(v_{S}-v_{\text {OUTMAX }}\right) \times \frac{V_{\text {OUTMAX }}}{R_{L}}$
where:
- $\mathrm{T}_{\text {MAX }}=$ Maximum ambient temperature
- $\theta_{\mathrm{JA}}=$ Thermal resistance of the package
- $\mathrm{PD}_{\text {MAX }}=$ Maximum power dissipation of one amplifier
- $\mathrm{V}_{\mathrm{S}}=$ Total supply voltage
- $I_{q M A X}=$ Maximum quiescent supply current of one amplifier
- $\mathrm{V}_{\text {OUtMAX }}=$ Maximum output voltage swing of the application
- $\mathrm{R}_{\mathrm{L}}=$ Load resistance

## Package Characteristics

Weight of Packaged Device
0.4029 grams (Typical)

## Lid Characteristics

Finish: Gold
Case Isolation to Any Lead: $20 \times 10^{9} \Omega$ (min)

## Die Characteristics

## Die Dimensions

$1565 \mu \mathrm{~m} \times 2125 \mu \mathrm{~m}$ ( $62 \mathrm{mils} \times 84 \mathrm{mils}$ )
Thickness: $355 \mu \mathrm{~m} \pm 25 \mu \mathrm{~m}$ ( 14 mils $\pm 1 \mathrm{mil}$ )

## Interface Materials

GLASSIVATION
Type: Nitrox
Thickness: 15kÅ

## TOP METALLIZATION

Type: AICu (99.5\%/0.5\%)
Thickness: 30kÅ

## Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: ISL70227SEH

To report errors or suggestions for this datasheet, please go to www.intersil.com/askourstaff
FITs are available from our website at: http://rel.intersil.com/reports/search.php

## NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab (dimension k) may be used to identify pin one.
2. If a pin one identification mark is used in addition to a tab, the limits of dimension k do not apply.
3. This dimension allows for off-center lid, meniscus, and glass overrun.
4. Dimensions b1 and c1 apply to lead base metal only. Dimension Mapplies to lead plating and finish thickness. The maximum limits of lead dimensions $b$ and $c$ or $M$ shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
5. $N$ is the maximum number of terminal positions.
6. Measure dimension S1 at all four corners.
7. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
8. Dimension Q shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension Q minimum shall be reduced by 0.0015 inch $(0.038 \mathrm{~mm})$ maximum when solder dip lead finish is applied.
9. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
10. Controlling dimension: INCH.
