XC9572XV High-performance CPLD

DS052 (v3.0) June 25, 2007

Product Specification

Note: This product is being discontinued. You cannot order parts after May 14, 2008. Xilinx recommends replacing XC9572XV devices with equivalent XC9572XL devices in all designs as soon as possible. Recommended replacements are pin compatible, however require a V_{CC} change to 3.3V, and a recompile of the design file. In addition, there is no 1.8V I/O support. See **XCN07010** for details regarding this discontinuation, including device replacement recomendations for the XC9572XV CPLD.

Features

- 72 macrocells with 1,600 usable gates
- Available in small footprint packages
  - 44-pin VQFP (34 user I/O pins)
  - 100-pin TQFP (72-user I/O pins)
- Optimized for high-performance 2.5V systems
  - Low power operation
  - Multi-voltage operation
- Advanced system features
  - In-system programmable
  - Superior pin-locking and routability with Fast CONNECT™ II switch matrix
  - Extra wide 54-input Function Blocks
  - Up to 90 product-terms per macrocell with individual product-term allocation
  - Local clock inversion with three global and one product-term clocks
  - Individual output enable per output pin
  - Input hysteresis on all user and boundary-scan pin inputs
  - Bus-hold ciruitry on all user pin inputs
  - Full IEEE Standard 1149.1 boundary-scan (JTAG)
- Fast concurrent programming
- Slew rate control on individual outputs
- Enhanced data security features
- Excellent quality and reliability
  - 20 year data retention
  - ESD protection exceeding 2,000V

Description

The XC9572XV is a 2.5V CPLD targeted for high-performance, low-voltage applications in leading-edge communications and computing systems. It is comprised of four 54V18 Function Blocks, providing 1,600 usable gates with propagation delays of 5 ns.

Power Estimation

Power dissipation in CPLDs can vary substantially depending on the system frequency, design application and output loading. To help reduce power dissipation, each macrocell in a XC9500XV device may be configured for low-power mode (from the default high-performance mode). In addition, unused product-terms and macrocells are automatically deactivated by the software to further conserve power.

For a general estimate of I_{CC}, the following equation may be used:

$$P_{TOTAL} = P_{INT} + P_{IO} = I_{CCINT} \times V_{CCINT} + P_{IO}$$

Separating internal and I/O power here is convenient because XC9500XV CPLDs also separate the corresponding power pins. P_{IO} is a strong function of the load capacitance driven, so it is handled by I = CVf. I_{CCINT} is another situation that reflects the actual design considered and the internal switching speeds. An estimation expression for I_{CCINT} (taken from simulation) is:

$$I_{CCINT}(mA) = MC_{HS}(0.122 \times PT_{HS} + 0.238) + MC_{LP}(0.042 \times PT_{LP} + 0.171) + 0.04(MC_{HS} + MC_{LP}) \times f_{MAX} \times MC_{TOG}$$

where:

MC_{HS} = # macrocells used in high speed mode

MC_{LP} = #macrocells used in low power mode

PT_{HS} = average p-terms used per high speed macrocell

PT_{LP} = average p-terms used over low power macrocell

f_{MAX} = max clocking frequency in the device

MC_{TOG} = % macrocells toggling on each clock (12% is frequently a good estimate

This calculation was derived from laboratory measurements of an XC9500XV part filled with 16-bit counters and allowing a single output (the LSB) to be enabled. The actual I_{CC} value varies with the design application and should be verified during normal system operation. Figure 1 shows the above estimation in a graphical form. For a more detailed discussion of power consumption in this device, see Xilinx application note **XAPP361, "Planning for High Speed XC9500XV Designs."**

Supported I/O Standards

Table 1: **IOSTANDARD Options**

IOSTANDARD	V_{CCIO}
LVTTL	3.3V
LVCMOS2	2.5V
X25TO18	1.8V

The XC9572XV CPLD features both LVCMOS and LVTTL I/O implementations. See Table 1 for I/O standard voltages.

The LVTTL I/O standard is a general purpose EIA/JEDEC standard for 3.3V applications that use an LVTTL input buffer and Push-Pull output buffer. The LVCMOS2 standard is used in 2.5V applications.

XC9500XV CPLDs are also 1.8V I/O compatible. The X25TO18 setting is provided for generating 1.8V compatible outputs from a CPLD normally operating in a 2.5V environment. The default I/O Standard for pads without IOSTANDARD attributes is LVTTL for XC9500XV devices.

Absolute Maximum Ratings

Symbol	Description	Value	Units
V_{CC}	Supply voltage relative to GND	–0.5 to 2.7	V
V_{CCIO}	Supply voltage for output drivers	–0.5 to 3.6	V
V_{IN}	Input voltage relative to GND(1)	–0.5 to 3.6	V
V_{TS}	Voltage applied to 3-state output(1)	–0.5 to 3.6	V
T_{STG}	Storage temperature (ambient)	–65 to +150	°C
T_J	Junction temperature	+150	°C

Notes:

1. Maximum DC undershoot below GND must be limited to either 0.5V or 10 mA, whichever is easier to achieve. During transitions, the device pins may undershoot to –2.0V or overshoot to +3.6V, provided this over- or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.
2. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.
3. For solder specifications, see **Xilinx Packaging** .

Recommended Operation Conditions

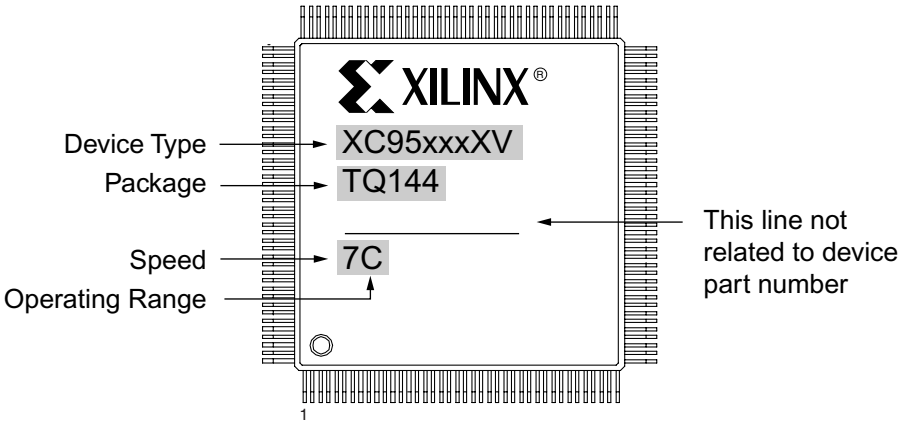
Device Part Marking and Ordering Combination Information



Sample package with part marking.

Notes:

1. Due to the small size of chip scale packages, part marking on these packages does not follow the above sample and the complete part number cannot be included in the marking. Part marking on chip scale packages by line:
   - Line 1 = X (Xilinx logo), then truncated part number (no XC), i.e., 95xxxXV.
   - Line 2 = Not related to device part number.
   - Line 3 = Not related to device part number.
   - Line 4 = Package code, speed, operating temperature, three digits not related to device part number. Package code: C1 = CS48.

Revision History

Date	Revision No.	Description
02/01/00	1.1	Initial Xilinx release. Advance information specification.
01/29/01	2.0	Added -4 performance specification and VQ44 pagkage. Deleted VQ64 package. Updated I_{CC} vs. Frequency Figure 1.
05/15/01	2.1	Updated I_{CC} formula, Recommended Operation Conditions, -4 and -5 AC Characteristics and Internal Timing Parameters
08/27/01	2.2	Changed V_{CCIO} 3.3V from 3.13 to 3.0 (min), 3.46 to 3.60 (max); DC characteristics: I_{IL} - added "low" current, I_{IH} - changed to "Input leakage high current"; Internal Timing: -5 T_{AOI} from 6.5 to 5.9.
05/31/02	2.3	Updated I_{CC} equation on page 1. Updated Component Availability Chart. Changed to Preliminary. Added second test condition and max measurement to I_{IH} DC Characteristics. Added Part Marking Information to Ordering Information. Removed the -4 device.
06/18/03	2.4	Updated T_{SOL} from 260 to 220°C. Updated Device Part Marking.
08/21/03	2.5	Updated Package Device Marking Pin 1 orientation.
04/15/05	2.6	Added T_{APRPW} specification to AC Characteristics. Added IOSTANDARD information.
01/16/06	2.7	Removed PC44 and CS48 packages as per **XCN05020**.
06/25/07	3.0	Notice of discontinuance.
