

SAA7102; SAA7103

Digital video encoder

Rev. 04 — 18 January 2006

Product data sheet

1. General description

The SAA7102; SAA7103 is used to encode PC graphics data at maximum 800×600 resolution to PAL (50 Hz) or NTSC (60 Hz) video signals. A programmable scaler and interlacer ensures properly sized and flicker-free TV display as CVBS or S-video output.

Alternatively, the three Digital-to-Analog Converters (DACs) can output RGB signals together with a TTL composite sync to feed SCART connectors.

When the scaler/interlacer is bypassed, a second VGA monitor can be connected to the RGB outputs and separate H and V-syncs as well, thereby serving as an auxiliary monitor at maximum 800×600 resolution/60 Hz (PIXCLK < 45 MHz).

The device includes a sync/clock generator and on-chip DACs.

2. Features

- Digital PAL/NTSC encoder with integrated high quality scaler and anti-flicker filter for TV output from a PC
- 27 MHz crystal-stable subcarrier generation
- Maximum graphics pixel clock 45 MHz at double edged clocking, synthesized on-chip or from external source
- Up to 800×600 graphics data at 60 Hz or 50 Hz with programmable underscan range.
- Three Digital-to-Analog Converters (DACs) at 27 MHz sample rate for CVBS (BLUE, C_B), VBS (GREEN, CVBS) and C (RED, C_R) (signals in parenthesis are optional); all at 10-bit resolution
- Non-Interlaced (NI) C_B -Y- C_R or RGB input at maximum 4 : 4 : 4 sampling
- Downscaling from 1 : 1 to 1 : 2 and up to 20 % upscaling
- Optional interlaced C_B -Y- C_R input of Digital Versatile Disc (DVD) signals
- Optional non-interlaced RGB output to drive second VGA monitor (bypass mode with maximum 45 MHz)
- 3×256 bytes RGB Look-Up Table (LUT)
- Support for hardware cursor
- Programmable border color of underscan area
- On-chip 27 MHz crystal oscillator (3rd-harmonic or fundamental 27 MHz crystal)
- Fast I²C-bus control port (400 kHz)
- Encoder can be master or slave
- Programmable horizontal and vertical input synchronization phase
- Programmable horizontal sync output phase
- Internal Color Bar Generator (CBG)
- Optional support of various Vertical Blanking Interval (VBI) data insertion

PHILIPS

- Macrovision Pay-per-View copy protection system rev. 7.01 and rev. 6.1 as option; this applies to the SAA7102 only
- Power-save modes
- Joint Test Action Group (JTAG) Boundary Scan Test (BST)
- Monolithic CMOS 3.3 V device, 5 V tolerant I/Os
- QFP44 and LBGA156 packages
- Same footprint as SAA7108E; SAA7109E

3. Quick reference data

Table 1: Quick reference data

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	analog supply voltage		3.15	3.3	3.45	V
V_{DDD}	digital supply voltage		3.0	3.3	3.6	V
I_{DDA}	analog supply current		1	110	140	mA
I_{DDD}	digital supply current		1	70	90	mA
V_i	input signal voltage levels		TTL compatible			
$V_{o(p-p)}$	analog CVBS output signal voltage for a 100/100 color bar at 75/2 Ω load (peak-to-peak value)		-	1.23	-	V
R_L	load resistance		-	37.5	-	Ω
$ILE_{if(DAC)}$	low frequency integral linearity error of DACs		-	-	± 3	LSB
$DLE_{if(DAC)}$	low frequency differential linearity error of DACs		-	-	± 1	LSB
T_{amb}	ambient temperature		0	-	70	$^{\circ}\text{C}$

4. Ordering information

Table 2: Ordering information

Type number	Package		
	Name	Description	Version
SAA7102E SAA7103E	LBGA156	plastic low profile ball grid array package; 156 balls; body 15 × 15 × 1.05 mm	SOT700-1
SAA7102H SAA7103H	QFP44	plastic quad flat package; 44 leads (lead length 1.3 mm); body 10 × 10 × 1.75 mm	SOT307-2

PD6	B4	43	I	MSB – 1 with C _B -Y-C _R 4 : 2 : 2; see Table 28 to Table 33 for pin assignment
PD7	A2	44	I	MSB with C _B -Y-C _R 4 : 2 : 2; see Table 28 to Table 33 for pin assignment

[1] Pin type: I = input, O = output, S = supply.

[2] In accordance with the "IEEE1149.1" standard the pins TDI, TMS, TCK and $\overline{\text{TRST}}$ are input pins with an internal pull-up resistor and TDO is a 3-state output pin.

[3] Pins FSVGC, VSVGC, $\overline{\text{CB}}\overline{\text{O}}$, HSVGC and TTXRQ_XCLKO2 are used for bootstrapping; see Section 7.1.

[4] For board design without boundary scan implementation connect $\overline{\text{TRST}}$ to ground.

[5] This pin provides easy initialization of the BST circuit. $\overline{\text{TRST}}$ can be used to force the Test Access Port (TAP) controller to the TEST_LOGIC_RESET state (normal operation) at once.

7. Functional description

The digital video encoder encodes digital luminance and color difference signals (C_B-Y-C_R) or digital RGB signals into analog CVBS, S-video and, optionally, RGB or C_R-Y-C_B signals. NTSC M, PAL B/G and sub-standards are supported.

The SAA7102; SAA7103 can be directly connected to a PC video graphics controller with a maximum resolution of 800 × 600 at a 50 Hz or 60 Hz frame rate. A programmable scaler scales the computer graphics picture so that it will fit into a standard TV screen with an adjustable underscan area. Non-interlaced-to-interlaced conversion is optimized with an adjustable anti-flicker filter for a flicker-free display at a very high sharpness.

Besides the most common 16-bit 4 : 2 : 2 C_B-Y-C_R input format (using 8 pins with double edge clocking), other C_B-Y-C_R and RGB formats are also supported; see Table 28 to Table 33.

A complete 3 × 256 bytes Look-Up Table (LUT), which can be used, for example, as a separate gamma corrector, is located in the RGB domain; it can be loaded either through the video input port Pixel Data (PD) or via the I²C-bus.

The SAA7102; SAA7103 supports a 32-bit × 32-bit × 2-bit hardware cursor, the pattern of which can also be loaded through the video input port or via the I²C-bus.

It is also possible to encode interlaced 4 : 2 : 2 video signals such as PC-DVD; for that the anti-flicker filter, and in most cases the scaler, will simply be bypassed.

Besides the applications for video output, the SAA7102; SAA7103 can also be used for generating a kind of auxiliary VGA output, when the RGB non-interlaced input signal is fed to the DACs. This may be of interest for example, when the graphics controller provides a second graphics window at its video output port.

The basic encoder function consists of subcarrier generation, color modulation and insertion of synchronization signals at a crystal-stable clock rate of 13.5 MHz (independent of the actual pixel clock used at the input side), corresponding to an internal 4 : 2 : 2 bandwidth in the luminance/color difference domain. Luminance and chrominance signals are filtered in accordance with the standard requirements of "RS-170-A" and "ITU-R BT.470-3".

For ease of analog post filtering the signals are twice oversampled to 27 MHz before digital-to-analog conversion.

The total filter transfer characteristics (scaler and anti-flicker filter are not taken into account) are illustrated in [Figure 6](#) to [Figure 11](#). All three DACs are realized with full 10-bit resolution. The C_R - Y - C_B to RGB dematrix can be bypassed (optionally) in order to provide the upsampled C_R - Y - C_B input signals.

The 8-bit multiplexed C_B - Y - C_R formats are "ITU-R BT.656" (D1 format) compatible, but the SAV and EAV codes can be decoded optionally, when the device is operated in Slave mode. For assignment of the input data to the rising or falling clock edge see [Table 28](#) to [Table 34](#).

In order to display interlaced RGB signals through a euro-connector TV set, a separate digital composite sync signal (pin HSM_CS SYNC) can be generated; it can be advanced up to 31 periods of the 27 MHz crystal clock in order to be adapted to the RGB processing of a TV set.

The SAA7102; SAA7103 synthesizes all necessary internal signals, color subcarrier frequency and synchronization signals from that clock.

Wide screen signalling data can be loaded via the I²C-bus and is inserted into line 23 for standards using a 50 Hz field rate.

VPS data for program dependent automatic start and stop of such featured VCRs is loadable via the I²C-bus.

The IC also contains closed caption and extended data services encoding (line 21), and supports teletext insertion for the appropriate bit stream format at a 27 MHz clock rate (see [Figure 15](#)). It is also possible to load data for the copy generation management system into line 20 of every field (525/60 line counting).

A number of possibilities are provided for setting different video parameters such as:

- Black and blanking level control
- Color subcarrier frequency
- Variable burst amplitude etc.

7.1 Reset conditions

To activate the reset a pulse at least of 2 crystal clocks duration is required.

During reset ($\overline{\text{RESET}} = \text{LOW}$) plus an extra 32 crystal clock periods, FSVGC, VSVGC, $\overline{\text{CBO}}$, HSVGC and TTX_SRES are set to input mode and HSM_CSYN and VSM are set to 3-state. A reset also forces the I²C-bus interface to abort any running bus transfer and sets it into receive condition.

After reset, the state of the I/Os and other functions is defined by the strapping pins until an I²C-bus access redefines the corresponding registers; see [Table 5](#).

Table 5: Strapping pins

Pin	Tied	Preset
FSVGC	LOW	NTSC M encoding, PIXCLK fits to 640 × 480 graphics input
	HIGH	PAL B/G encoding, PIXCLK fits to 640 × 480 graphics input
VSVGC	LOW	4 : 2 : 2 Y-C _B -C _R graphics input (format 0)
	HIGH	4 : 4 : 4 RGB graphics input (format 3)
$\overline{\text{CBO}}$	LOW	input demultiplex phase: LSB = LOW
	HIGH	input demultiplex phase: LSB = HIGH
HSVGC	LOW	input demultiplex phase: MSB = LOW
	HIGH	input demultiplex phase: MSB = HIGH
TTXRQ_XCLKO2	LOW	slave (FSVGC, VSVGC and HSVGC are inputs, internal color bar is active)
	HIGH	master (FSVGC, VSVGC and HSVGC are outputs)

7.2 Input formatter

The input formatter converts all accepted PD input data formats, either RGB or Y-C_B-C_R, to a common internal RGB or Y-C_B-C_R data stream.

When double-edge clocking is used, the data is internally split into portions PPD1 and PPD2. The clock edge assignment must be set according to the I²C-bus control bits EDGE1 and EDGE2 for correct operation.

If Y-C_B-C_R is being applied as a 27 MB/s data stream, the output of the input formatter can be used directly to feed the video encoder block.

7.3 RGB LUT

The three 256 byte RAMs of this block can be addressed by three 8-bit wide signals, thus it can be used to build any transformation, e.g. a gamma correction for RGB signals. In the event that the indexed color data is applied, the RAMs are addressed in parallel.

The LUTs can either be loaded by an I²C-bus write access or can be part of the pixel data input through the PD port. In the latter case, 256 bytes × 3 bytes for the R, G and B LUT are expected at the beginning of the input video line, two lines before the line that has been defined as first active line, until the middle of the line immediately preceding the first active line. The first 3 bytes represent the first RGB LUT data, and so on.

7.4 Cursor insertion

A 32 dots × 32 dots cursor can be overlaid as an option; the bit map of the cursor can be uploaded by an I²C-bus write access to specific registers or in the pixel data input through the PD port. In the latter case, the 256 bytes defining the cursor bit map (2 bits per pixel) are expected immediately following the last RGB LUT data in the line preceding the first active line.

The cursor bit map is set up as follows: each pixel occupies 2 bits. The meaning of these bits depends on the CMODE I²C-bus register as described in [Table 8](#). Transparent means that the input pixels are passed through, the 'cursor colors' can be programmed in separate registers.

The bit map is stored with 4 pixels per byte, aligned to the least significant bit. So the first pixel is in bits 0 and 1, the next pixel in bits 3 and 4 and so on. The first index is the column, followed by the row; index 0,0 is the upper left corner.

Table 6: Layout of a byte in the cursor bit map

7	6	5	4	3	2	1	0
pixel n + 3		pixel n + 2		pixel n + 1		pixel n	
D1	D0	D1	D0	D1	D0	D1	D0

For each direction, there are 2 registers controlling the position of the cursor, one controls the position of the 'hot spot', the other register controls the insertion position. The hot spot is the 'tip' of the pointer arrow. It can have any position in the bit map. The actual position registers describe the co-ordinates of the hot spot. Again 0,0 is the upper left corner. While it is not possible to move the hot spot beyond the left respectively upper screen border this is perfectly legal for the right respectively lower border. It should be noted that the cursor position is described relative to the input resolution.

Table 7: Cursor bit map

Byte	7	6	5	4	3	2	1	0
0	row 0 column 3	row 0 column 2	row 0 column 1	row 0 column 0				
1	row 0 column 7	row 0 column 6	row 0 column 5	row 0 column 4				
2	row 0 column 11	row 0 column 10	row 0 column 9	row 0 column 8				
...				
6	row 0 column 27	row 0 column 26	row 0 column 25	row 0 column 24				
7	row 0 column 31	row 0 column 30	row 0 column 29	row 0 column 28				
...				
254	row 31 column 27	row 31 column 26	row 31 column 25	row 31 column 24				
255	row 31 column 31	row 31 column 30	row 31 column 29	row 31 column 28				

Table 8: Cursor modes

Cursor pattern	Cursor mode	
	CMODE = 0	CMODE = 1
00	second cursor color	second cursor color
01	first cursor color	first cursor color
10	transparent	transparent
11	inverted input	auxiliary cursor color

7.5 RGB Y-C_B-C_R matrix

RGB input signals to be encoded to PAL or NTSC are converted to the Y-C_B-C_R color space in this block. The color difference signals are fed through low-pass filters and formatted to a ITU-R BT.601 like 4 : 2 : 2 data stream for further processing.

The matrix and formatting blocks can be bypassed for Y-C_B-C_R graphics input.

When the auxiliary VGA mode is selected, the output of the cursor insertion block is immediately directed to the triple DAC.

7.6 Horizontal scaler

The high quality horizontal scaler operates on the 4 : 2 : 2 data stream. Its control engines compensate the color phase offset automatically.

The scaler starts processing after a programmable horizontal offset and continues with a number of input pixels. Each input pixel is a programmable fraction of the current output pixel (XINC/4096). A special case is XINC = 0, this sets the scaling factor to 1.

If the SAA7102; SAA7103 input data is in accordance with "ITU-R BT.656", the scaler enters another mode. In this event, XINC needs to be set to 2048 for a scaling factor of 1. With higher values, upscaling will occur.

The phase resolution of the circuit is 12 bits, giving a maximum offset of 0.2 after 800 input pixels. Small FIFOs rearrange a 4 : 2 : 2 data stream at the scaler output.

7.7 Vertical scaler and anti-flicker filter

The functions scaling, Anti-Flicker Filter (AFF) and re-interlacing are implemented in the vertical scaler.

Besides the entire input frame, it receives the first and last lines of the border to allow anti-flicker filtering.

The circuit generates the interlaced output fields by scaling down the input frames with different offsets for odd and even fields. Increasing the YSKIP setting reduces the anti-flicker function. A YSKIP value of 4095 switches it off; see [Table 91](#).

The programming is similar to the horizontal scaler. For the re-interlacing, the resolutions of the offset registers are not sufficient, so the weighting factors for the first lines can also be adjusted. YINC = 0 sets the scaling factor to 1; YIWGTO and YIWGTE must not be 0.

Due to the re-interlacing, the circuit can perform upscaling. The maximum factor depends on the setting of the anti-flicker function and can be derived from the formulae given in [Section 7.17](#).

7.8 FIFO

The FIFO acts as a buffer to translate from the PIXCLK clock domain to the XTAL clock domain. The write clock is PIXCLK and the read clock is XTAL. An underflow or overflow condition can be detected via the I²C-bus read access.

In order to avoid underflows and overflows, it is essential that the frequency of the synthesized PIXCLK matches to the input graphics resolution and the desired scaling factor. It is suggested to refer to [Table 9](#) to [Table 26](#) for some representative combinations.

7.9 Border generator

When the graphics picture is to be displayed as interlaced PAL, NTSC, S-video or RGB on a TV screen, it is desired in many cases not to lose picture information due to the inherent overscanning of a TV set. The desired amount of underscan area, which is achieved through appropriate scaling in the vertical and horizontal direction, can be filled in the border generator with an arbitrary true color tint.

7.10 Oscillator and Discrete Time Oscillator (DTO)

The master clock generation is realized as a 27 MHz crystal oscillator, which can operate with either a fundamental wave crystal or a 3rd-harmonic crystal.

The crystal clock supplies the DTO of the pixel clock synthesizer, the video encoder and the I²C-bus control block. It also usually supplies the triple DAC, with the exception of the auxiliary VGA mode, where the triple DAC is clocked by the pixel clock (PIXCLK).

The DTO can be programmed to synthesize all relevant pixel clock frequencies between circa 18 MHz and 44 MHz.

7.11 Low-pass Clock Generation Circuit (CGC)

This block reduces the phase jitter of the synthesized pixel clock. It works as a tracking filter for all relevant synthesized pixel clock frequencies.

7.12 Encoder

7.12.1 Video path

The encoder generates luminance and color subcarrier output signals from the Y, C_B and C_R baseband signals, which are suitable for use as CVBS or separate Y and C signals.

Input to the encoder, at 27 MHz clock (e.g. DVD), is either originated from computer graphics at pixel clock, fed through the FIFO and border generator, or a ITU-R BT.656 style signal.

Luminance is modified in gain and in offset (the offset is programmable in a certain range to enable different black level set-ups). A blanking level can be set after insertion of a fixed synchronization pulse tip level, in accordance with standard composite synchronization

schemes. Other manipulations used for the Macrovision anti-taping process, such as additional insertion of AGC super-white pulses (programmable in height), are supported by the SAA7102 only.

To enable easy analog post filtering, luminance is interpolated from a 13.5 MHz data rate to a 27 MHz data rate, thereby providing luminance in a 10-bit resolution. The transfer characteristics of the luminance interpolation filter are illustrated in [Figure 8](#) and [Figure 9](#). Appropriate transients at start/end of active video and for synchronization pulses are ensured.

Chrominance is modified in gain (programmable separately for C_B and C_R), and a standard dependent burst is inserted, before baseband color signals are interpolated from a 6.75 MHz data rate to a 27 MHz data rate. One of the interpolation stages can be bypassed, thus providing a higher color bandwidth, which can be used for the Y and C output. The transfer characteristics of the chrominance interpolation filter are illustrated in [Figure 6](#) and [Figure 7](#).

The amplitude (beginning and ending) of the inserted burst, is programmable in a certain range that is suitable for standard signals and for special effects. After the succeeding quadrature modulator, color is provided on the subcarrier in 10-bit resolution.

The numeric ratio between the Y and C outputs is in accordance with the standards.

7.12.2 Teletext insertion and encoding (not simultaneously with real-time control)

Pin TTX_SRES receives a WST or NABTS teletext bitstream sampled at the crystal clock. At each rising edge of the output signal (TTXRQ) a single teletext bit has to be provided after a programmable delay at input pin TTX_SRES.

Phase variant interpolation is achieved on this bitstream in the internal teletext encoder, providing sufficient small phase jitter on the output text lines.

TTXRQ_XCLKO2 provides a fully programmable request signal to the teletext source, indicating the insertion period of bitstream at lines which can be selected independently for both fields. The internal insertion window for text is set to 360 (PAL WST), 296 (NTSC WST) or 288 (NABTS) teletext bits including clock run-in bits. The protocol and timing are illustrated in [Figure 15](#).

Alternatively, this pin can be provided with a buffered crystal clock (XCLK) of 13.5 MHz.

7.12.3 Video Programming System (VPS) encoding

Five bytes of VPS information can be loaded via the I²C-bus and will be encoded in the appropriate format into line 16.

7.12.4 Closed caption encoder

Using this circuit, data in accordance with the specification of closed caption or extended data service, delivered by the control interface, can be encoded (line 21). Two dedicated pairs of bytes (two bytes per field), each pair preceded by run-in clocks and framing code, are possible.

The actual line number in which data is to be encoded, can be modified in a certain range.

The data clock frequency is in accordance with the definition for NTSC M standard 32 times horizontal line frequency.

Data LOW at the output of the DACs corresponds to 0 IRE, data HIGH at the output of the DACs corresponds to approximately 50 IRE.

It is also possible to encode closed caption data for 50 Hz field frequencies at 32 times the horizontal line frequency.

7.12.5 Anti-taping (SAA7102 only)

For more information contact your nearest Philips Semiconductors sales office.

7.13 RGB processor

This block contains a dematrix in order to produce RED, GREEN and BLUE signals to be fed to a SCART plug.

Before Y, C_B and C_R signals are de-matrixed, individual gain adjustment for Y and color difference signals and 2 times oversampling for luminance and 4 times oversampling for color difference signals is performed. The transfer curves of luminance and color difference components of RGB are illustrated in [Figure 10](#) and [Figure 11](#).

7.14 Triple DAC

Both Y and C signals are converted from digital-to-analog in a 10-bit resolution at the output of the video encoder. Y and C signals are also combined into a 10-bit CVBS signal.

The CVBS output signal occurs with the same processing delay as the Y, C and optional RGB or C_R -Y- C_B outputs. Absolute amplitude at the input of the DAC for CVBS is reduced by $\frac{15}{16}$ with respect to Y and C DACs to make maximum use of the conversion ranges.

RED, GREEN and BLUE signals are also converted from digital-to-analog, each providing a 10-bit resolution.

The reference currents of all three DACs can be adjusted individually in order to adapt for different output signals. In addition, all reference currents can be adjusted commonly to compensate for small tolerances of the on-chip band gap reference voltage.

Alternatively, all currents can be switched off to reduce power dissipation.

All three outputs can be used to sense for an external load (usually 75 Ω) during a pre-defined output. A flag in the I²C-bus status byte reflects whether a load is applied or not.

If the SAA7102; SAA7103 is required to drive a second (auxiliary) VGA monitor, the DACs receive the signal directly from the cursor insertion block. In this event, the DACs are clocked at the incoming PIXCLKI instead of the 27 MHz crystal clock used in the video encoder.

7.15 Timing generator

The synchronization of the SAA7102; SAA7103 is able to operate in two modes; Slave mode and Master mode.

In Slave mode, the circuit accepts sync pulses on the bidirectional FSVGC (frame sync), VSVGC (vertical sync) and HSVGC (horizontal sync) pins: the polarities of the signals can be programmed. The frame sync signal is only necessary when the input signal is

interlaced, in other cases it may be omitted. If the frame sync signal is present, it is possible to derive the vertical and the horizontal phase from it by setting the HFS and VFS bits. HSVGC and VSVG C are not necessary in this case, so it is possible to switch the pins to output mode.

Alternatively, the device can be triggered by auxiliary codes in a ITU-R BT.656 data stream via PD7 to PD0.

Only vertical frequencies of 50 Hz and 60 Hz are allowed with the SAA7102; SAA7103. In Slave mode, it is not possible to lock the encoders color carrier to the line frequency with the PHRES bits.

In the (more common) Master mode, the time base of the circuit is continuously free-running. The IC can output a frame sync at pin FSVG C, a vertical sync at pin VSVG C, a horizontal sync at pin HSVGC and a composite blanking signal at pin $\overline{\text{CBO}}$. All of these signals are defined in the PIXCLK domain. The duration of HSVGC and VSVG C are fixed, they are 64 clocks for HSVGC and 1 line for VSVG C. The leading slopes are in phase and the polarities can be programmed.

The input line length can be programmed. The field length is always derived from the field length of the encoder and the pixel clock frequency that is being used.

$\overline{\text{CBO}}$ acts as a data request signal. The circuit accepts input data at a programmable number of clocks after $\overline{\text{CBO}}$ goes active. This signal is programmable and it is possible to adjust the following (see [Figure 13](#) and [Figure 14](#)):

- The horizontal offset
- The length of the active part of the line
- The distance from active start to first expected data
- The vertical offset separately for odd and even fields
- The number of lines per input field

In most cases, the vertical offsets for odd and even fields are equal. If they are not, then the even field will start later. The SAA7102; SAA7103 will also request the first input lines in the even field, the total number of requested lines will increase by the difference of the offsets.

As stated above, the circuit can be programmed to accept the look-up and cursor data in the first 2 lines of each field. The timing generator provides normal data request pulses for these lines; the duration is the same as for regular lines. The additional request pulses will be suppressed with LUTL set to logic 0; see [Table 101](#). The other vertical timings do not change in this case, so the first active line can be number 2, counted from 0.

7.16 I²C-bus interface

The I²C-bus interface is a standard slave transceiver, supporting 7-bit slave addresses and 400 kbit/s guaranteed transfer rate. It uses 8-bit subaddressing with an auto-increment function. All registers are write and read, except two read only status bytes.

The register bit map consists of an RGB Look-Up Table (LUT), a cursor bit map and control registers. The LUT contains three banks of 256 bytes, where each RGB triplet is assigned to one address. Thus a write access needs the LUT address and three data

bytes following subaddress FFh. For further write access auto-incrementing of the LUT address is performed. The cursor bit map access is similar to the LUT access but contains only a single byte per address.

The I²C-bus slave address is defined as 88h.

7.17 Programming the SAA7102; SAA7103

In order to program the SAA7102; SAA7103 it is first necessary to determine the input and output field timings. The timings are controlled by decoding binary counters that index the position in the current line and field respectively. In both cases, 0 means the start of the sync pulse.

At 60 Hz, the first visible pixel has the index 256, 710 pixels can be encoded; at 50 Hz, the index is 284, 702 pixels can be visible. Some variables are defined below:

- InPix: the number of active pixels per input line
- InPpl: the length of the entire input line in pixel clocks
- InLin: the number of active lines per input field/frame
- TPclk: the pixel clock period
- OutPix: the number of active pixels per output line
- OutLin: the number of active lines per output field
- TXclk: the encoder clock period (37.037 ns)

The output lines should be centred on the screen. It should be noted that the encoder has 2 clocks per pixel; see [Table 62](#).

ADWHS = 256 + 710 – OutPix (60 Hz); ADWHS = 284 + 702 – OutPix (50 Hz);
ADWHE = ADWHS + OutPix × 2 (all frequencies)

For vertical, the procedure is the same. At 60 Hz, the first line with video information is number 19, 240 lines can be active. For 50 Hz, the numbers are 23 and 287; see [Table 70](#) to [Table 72](#).

$$FAL = 19 + \frac{240 - OutLin}{2} \text{ (60 Hz); } FAL = 23 + \frac{287 - OutLin}{2} \text{ (50 Hz);}$$

LAL = FAL + OutLin (all frequencies).

Most TV sets use overscan, and not all pixels respectively lines are visible. There is no standard for the factor, it is highly recommended to make the number of output pixels and lines adjustable. A reasonable underscan factor is 10 %, giving approximately 640 output pixels per line.

The total number of pixel clocks per line and the input horizontal offset need to be chosen next. The only constraint is that the horizontal blanking has at least 10 clock pulses.

The required pixel clock frequency can be determined in the following way: Due to the limited internal FIFO size, the input path has to provide all pixels in the same time frame as the encoders vertical active time. The scaler also has to process the first and last border lines for the anti-flicker function. Thus:

$$TPclk = \frac{262.5 \times 1716 \times TXclk}{InPpl \times \text{integer}\left(\frac{InLin + 2}{OutLin} \times 262.5\right)} \quad (60 \text{ Hz})$$

$$TPclk = \frac{312.5 \times 1728 \times TXclk}{InPpl \times \text{integer}\left(\frac{InLin + 2}{OutLin} \times 312.5\right)} \quad (50 \text{ Hz}) \text{ and for the pixel clock generator}$$

$$PCL = \frac{TXclk}{TPclk} \times 2^{21} \quad (\text{all frequencies}); \text{ see } \text{Table 74}.$$

The input vertical offset can be taken from the assumption that the scaler should just have finished writing the first line when the encoder starts reading it:

$$YOF5 = \frac{FAL \times 1716 \times TXclk}{InPpl \times TPclk} - 2 \quad (60 \text{ Hz}) \quad YOF5 = \frac{FAL \times 1728 \times TXclk}{InPpl \times TPclk} - 2 \quad (50 \text{ Hz})$$

In most cases the vertical offsets will be the same for odd and even fields. The results should be rounded down.

Once the timings are known the scaler can be programmed.

XOFS can be chosen arbitrarily, the condition being that $XOFS + XPIX \leq HLEN$ is fulfilled. Values given by the VESA display timings are preferred.

$$HLEN = InPpl - 1$$

$$XPIX = \frac{InPix}{2}$$

$$XINC = \frac{OutPix}{InPix} \times 4096$$

XINC needs to be rounded up, it needs to be set to 0 for a scaling factor of 1.

$$YPIX = InLin$$

YSKIP defines the anti-flicker function. 0 means maximum flicker reduction but minimum vertical bandwidth, 4095 gives no flicker reduction and maximum bandwidth.

$$YINC = \frac{OutLin}{InLin + 2} \times \left(1 + \frac{YSKIP}{4095}\right) \times 4096$$

$$YIWGTO = \frac{YINC}{2} + 2048$$

$$YIWGTE = \frac{YINC - YSKIP}{2}$$

When $YINC = 0$ it sets the scaler to scaling factor 1. The initial weighting factors must not be set to 0 in this case. YIWGTE may go negative. In this event, YINC should be added and YOFSE incremented. This can be repeated as often as necessary to make YIWGTE positive.

Due to the limited amount of memory it is not possible to get valid vertical scaler settings only from the formulae above. In some cases it is necessary to adjust the vertical offsets or the scaler increment to get valid settings. [Table 9](#) to [Table 26](#) show verified settings. They are organized in the following way: The tables are separate for the standard to be encoded, the input resolution and three different anti-flicker filter settings. Each table contains 5 vertical sizes with 5 different offsets. They are intended to be selected according to the current TV set. The corresponding horizontal resolutions of 640 pixels give proper aspect ratios. They can be adjusted according to the formulae above. The next line gives a minimum size intended to fit on the screen under all circumstances. The corresponding horizontal resolution is 620 pixels. Overscan is only possible with an input resolution of 800×600 pixels. Where possible, the corresponding settings are given on the last lines of the tables.

7.18 Input levels and formats

The SAA7102; SAA7103 accepts digital Y, C_B, C_R or RGB data with levels (digital codes) in accordance with "ITU-R BT.601"; see [Table 27](#).

For C and CVBS outputs, deviating amplitudes of the color difference signals can be compensated for by independent gain control setting, while gain for luminance is set to predefined values, distinguishable for 7.5 IRE set-up or without set-up.

The RGB, respectively C_R-Y-C_B path features an individual gain setting for luminance (GY) and color difference signals (GCD). Reference levels are measured with a color bar, 100 % white, 100 % amplitude and 100 % saturation.

8.2 I²C-bus format

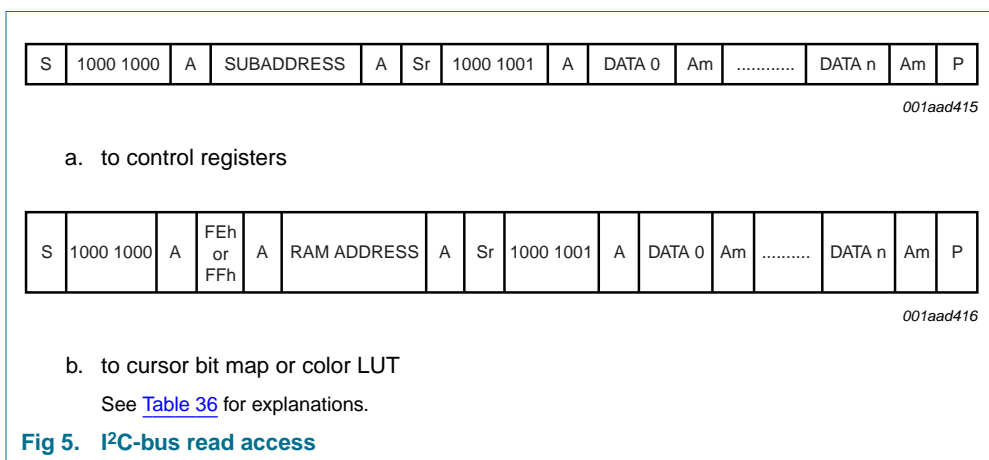

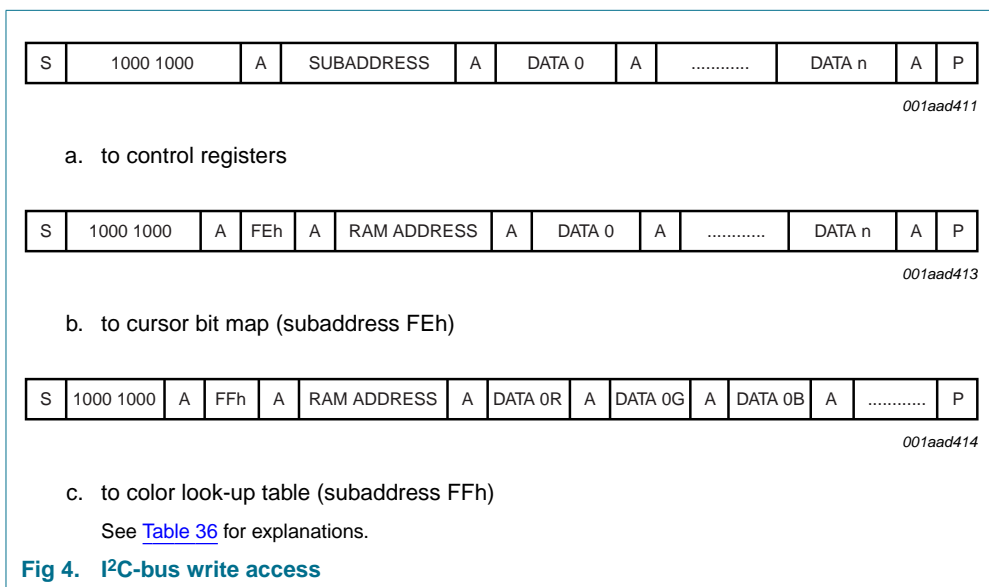

Table 36: Explanations of Figure 4 and Figure 5

Code	Description
S	START condition
Sr	repeated START condition
1000 100X ^[1]	slave address
A	acknowledge generated by the slave
Am	acknowledge generated by the master
SUBADDRESS ^[2]	subaddress byte
DATA	data byte
-----	continued data bytes and acknowledges
P	STOP condition
RAM ADDRESS	start address for RAM access

[1] X is the read/write control bit; X = logic 0 is order to write; X = logic 1 is order to read.

[2] If more than 1 byte of DATA is transmitted, then auto-increment of the subaddress is performed.

8.3 Slave receiver

Table 37: Common DAC adjust fine register, subaddress 16h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 4	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
3 to 0	DACF[3:0]	R/W		DAC fine output voltage adjustment, 1 % steps for all DACs
			0111	7 %
			0110	6 %
			0101	5 %
			0100	4 %
			0011	3 %
			0010	2 %
			0001	1 %
			0000*	0 %
			1000	0 %
			1001	-1 %
			1010	-2 %
			1011	-3 %
			1100	-4 %
			1101	-5 %
			1110	-6 %
			1111	-7 %

Table 38: RGB DAC adjust coarse registers, subaddresses 17h to 19h, bit description

Subaddress	Bit	Symbol	Description
17h to 19h	7 to 5	-	must be programmed with logic 0 to ensure compatibility to future enhancements
17h	4 to 0	RDACC[4:0]	output level coarse adjustment for RED DAC; default after reset is 1Bh for output of C signal 0 0000b \equiv 0.585 V to 1 1111b \equiv 1.240 V at 37.5 Ω nominal for full-scale conversion
18h	4 to 0	GDACC[4:0]	output level coarse adjustment for GREEN DAC; default after reset is 1Bh for output of VBS signal 0 0000b \equiv 0.585 V to 1 1111b \equiv 1.240 V at 37.5 Ω nominal for full-scale conversion
19h	4 to 0	BDACC[4:0]	output level coarse adjustment for BLUE DAC; default after reset is 1Fh for output of CVBS signal 0 0000b \equiv 0.585 V to 1 1111b \equiv 1.240 V at 37.5 Ω nominal for full-scale conversion

Table 39: MSM threshold, subaddress 1Ah, bit description

Bit	Symbol	Description
7 to 0	MSMT[7:0]	monitor sense mode threshold for DAC output voltage, should be set to 70h

Table 40: Monitor sense mode register, subaddress 1Bh, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	MSM	R/W		monitor sense mode
			0*	off; RCOMP, GCOMP and BCOMP bits are not valid
			1	on
6 to 3	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
2	RCOMP	R		check comparator at DAC on pin RED_CR_C
			0	active, output is loaded
			1	inactive, output is not loaded
1	GCOMP	R		check comparator at DAC on pin GREEN_VBS_CVBS
			0	active, output is loaded
			1	inactive, output is not loaded
0	BCOMP	R		check comparator at DAC on pin BLUE_CB_CVBS
			0	active, output is loaded
			1	inactive, output is not loaded

Table 41: Wide screen signal registers, subaddresses 26h and 27h, bit description

Legend: * = default value after reset.

Subaddress	Bit	Symbol	Access	Value	Description
27h	7	WSSON	R/W	0*	wide screen signalling output is disabled
				1	wide screen signalling output is enabled
	6	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
	5 to 3	WSS[13:11]	R/W	-	wide screen signalling bits, reserved
	2 to 0	WSS[10:8]	R/W	-	wide screen signalling bits, subtitles
26h	7 to 4	WSS[7:4]	R/W	-	wide screen signalling bits, enhanced services
	3 to 0	WSS[3:0]	R/W	-	wide screen signalling bits, aspect ratio

Table 42: Real-time control and burst start register, subaddress 28h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 and 6	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
5 to 0	BS[5:0]	R/W		starting point of burst in clock cycles
			21h*	PAL: BS = 33; strapping pin FSVGC tied to HIGH
			19h*	NTSC: BS = 25; strapping pin FSVGC tied to LOW

Table 43: Sync reset enable and burst end register, subaddress 29h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	SRES	R/W	0*	pin TTX_SRES accepts a teletext bit stream (TTX)
			1	pin TTX_SRES accepts a sync reset input (SRES); a HIGH impulse resets synchronization of the encoder (first field, first line)
6	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
5 to 0	BE[5:0]	R/W		ending point of burst in clock cycles
			1Dh*	PAL: BE = 29; strapping pin FSVGC tied to HIGH
			1Dh*	NTSC: BE = 29; strapping pin FSVGC tied to LOW

Table 44: Copy generation 0, 1, 2 and CG enable registers, subaddresses 2Ah to 2Ch, bit description

Legend: * = default value after reset.

Subaddress	Bit	Symbol	Access	Value	Description
2Ch	7	CGEN	R/W	0*	disabled
				1	enabled
				6 to 4 -	R/W
	3 to 0	CG[19:16]	R/W	-	LSBs of the respective bytes are encoded immediately after run-in, the MSBs of the respective bytes have to carry the CRCC bits, in accordance with the definition of copy generation management system encoding format.
2Bh	7 to 0	CG[15:8]			
2Ah	7 to 0	CG[7:0]			

Table 45: Output port control register, subaddress 2Dh, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	VBSEN	R/W		pin GREEN_VBS_CVBS provides a
			0	component GREEN signal (CVBSEN1 = 0) or CVBS signal (CVBSEN1 = 1)
			1*	luminance (VBS) signal
6	CVBSEN1	R/W		pin GREEN_VBS_CVBS provides a
			0*	component GREEN (G) or luminance (VBS) signal
			1	CVBS signal
5	CVBSEN0	R/W		pin BLUE_CB_CVBS provides a
			0	component BLUE (B) or color difference BLUE (C _B) signal
			1*	CVBS signal
4	CEN	R/W		pin RED_CR_C provides a
			0	component RED (R) or color difference RED (C _R) signal
			1*	chrominance signal (C) as modulated subcarrier for S-video
3	ENCOFF	R/W		encoder
			0*	active
			1	bypass, DACs are provided with RGB signal after cursor insertion block
2	CLK2EN	R/W		pin TTXRQ_XCLKO2 provides
			0	teletext request signal (TTXRQ)
			1*	buffered crystal clock divided by two (13.5 MHz)
1 and 0	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements

Table 46: Gain luminance for RGB register, subaddress 38h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 5	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
4 to 0	GY[4:0]	R/W	-	Gain luminance of RGB (C_R , Y and C_B) output, ranging from $(1 - 16/32)$ to $(1 + 15/32)$. Suggested nominal value = 0, depending on external application.

Table 47: Gain color difference for RGB register, subaddress 39h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 5	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
4 to 0	GCD[4:0]	R/W	-	Gain color difference of RGB (C_R , Y and C_B) output, ranging from $(1 - 16/32)$ to $(1 + 15/32)$. Suggested nominal value = 0, depending on external application.

Table 48: Input port control 1 register, subaddress 3Ah, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	CBENB	R/W	0	data from input ports is encoded
			1	color bar with fixed colors is encoded
6 and 5	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
4	SYMP	R/W		horizontal and vertical trigger
			0*	taken from FSVG or both VSVG and HSVG
			1	decoded out of 'ITU-R BT.656' compatible data at PD port
3	DEMOFF	R/W		Y- C_B - C_R to RGB dematrix
			0*	active
			1	bypassed
2	CSYNC	R/W		pin HSM_CSYSN provides
			0	horizontal sync for non-interlaced VGA components output (at PIXCLK)
			1	composite sync for interlaced components output (at XTAL clock)
1	Y2C	R/W		input luminance data
			0	twos complement from PD input port
			1*	straight binary from PD input port
0	UV2C	R/W		input color difference data
			0	twos complement from PD input port
			1*	straight binary from PD input port

Table 49: VPS enable, input control 2, subaddress 54h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	VPSEN	R/W		video programming system data insertion
			0*	is disabled
			1	in line 16 is enabled
6 to 2	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
1	EDGE2	R/W		internal PPD2 data is sampled with
			0	rising clock edges
			1*	falling clock edges; see Table 28 to Table 34
0	EDGE1	R/W		internal PPD1 data is sampled with
			0*	rising clock edges
			1	falling clock edges; see Table 28 to Table 34

Table 50: VPS byte 5, 11, 12, 13 and 14 registers, subaddresses 55h to 59h, bit description [1]

Subaddress	Bit	Symbol	Access	Value	Description
55h	7 to 0	VPS5[7:0]	R/W	-	fifth byte of video programming system data
56h	7 to 0	VPS11[7:0]	R/W	-	eleventh byte of video programming system data
57h	7 to 0	VPS12[7:0]	R/W	-	twelfth byte of video programming system data
58h	7 to 0	VPS13[7:0]	R/W	-	thirteenth byte of video programming system data
59h	7 to 0	VPS14[7:0]	R/W	-	fourteenth byte of video programming system data

[1] In line 16; LSB first; all other bytes are not relevant for VPS.

Table 51: Chrominance phase register, subaddress 5Ah, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 0	CHPS[7:0]	R/W	00h*	phase of encoded color subcarrier (including burst) relative to horizontal sync; can be adjusted in steps of 360/256 degrees
			6Bh	PAL B/G and data from input ports in Master mode
			16h	PAL B/G and data from look-up table
			25h	NTSC M and data from input ports in Master mode
			46h	NTSC M and data from look-up table

Table 52: Gain U and gain U MSB, black level registers, subaddresses 5Bh and 5Dh, bit description

Subaddress	Bit	Symbol	Conditions	Remarks
5Bh	7 to 0	GAINU[8:0] [1]	white-to-black = 92.5 IRE	GAINU = $-2.17 \times \text{nominal}$ to $+2.16 \times \text{nominal}$
5Dh	7		GAINU = 0	output subcarrier of U contribution = 0
			GAINU = 118 (76h)	output subcarrier of U contribution = nominal
			white-to-black = 100 IRE	GAINU = $-2.05 \times \text{nominal}$ to $+2.04 \times \text{nominal}$
			GAINU = 0	output subcarrier of U contribution = 0
			GAINU = 125 (7Dh)	output subcarrier of U contribution = nominal
6	-		must be programmed with logic 0 to ensure compatibility to future enhancements	
5 to 0		BLCKL[5:0] [2]	white-to-sync = 140 IRE [3]	recommended value: BLCKL = 58 (3Ah)
			BLCKL = 0 [3]	output black level = 29 IRE
			BLCKL = 63 (3Fh) [3]	output black level = 49 IRE
			white-to-sync = 143 IRE [4]	recommended value: BLCKL = 51 (33h)
			BLCKL = 0 [4]	output black level = 27 IRE
			BLCKL = 63 (3Fh) [4]	output black level = 47 IRE

[1] Variable gain for C_B signal; input representation in accordance with 'ITU-R BT.601'.

[2] Variable black level; input representation in accordance with 'ITU-R BT.601'.

[3] Output black level/IRE = $\text{BLCKL} \times 2/6.29 + 28.9$.

[4] Output black level/IRE = $\text{BLCKL} \times 2/6.18 + 26.5$.

Table 53: Gain V and gain V MSB, blanking level registers, subaddresses 5Ch and 5Eh, bit description

Subaddress	Bit	Symbol	Conditions	Remarks
5Ch	7 to 0	GAINV[8:0] [1]	white-to-black = 92.5 IRE	GAINV = $-1.55 \times \text{nominal}$ to $+1.55 \times \text{nominal}$
5Eh	7		GAINV = 0	output subcarrier of V contribution = 0
			GAINV = 165 (A5h)	output subcarrier of V contribution = nominal
			white-to-black = 100 IRE	GAINV = $-1.46 \times \text{nominal}$ to $+1.46 \times \text{nominal}$
			GAINV = 0	output subcarrier of V contribution = 0
			GAINV = 175 (AFh)	output subcarrier of V contribution = nominal
6	-		must be programmed with logic 0 to ensure compatibility to future enhancements	
5 to 0		BLNNL[5:0] [2]	white-to-sync = 140 IRE [3]	recommended value: BLNNL = 46 (2Eh)
			BLNNL = 0 [3]	output blanking level = 25 IRE
			BLNNL = 63 (3Fh) [3]	output blanking level = 45 IRE
			white-to-sync = 143 IRE [4]	recommended value: BLNNL = 53 (35h)
			BLNNL = 0 [4]	output blanking level = 26 IRE
			BLNNL = 63 (3Fh) [4]	output blanking level = 46 IRE

[1] Variable gain for C_R signal; input representation in accordance with 'ITU-R BT.601'.

[2] Variable blanking level.

[3] Output black level/IRE = $\text{BLNNL} \times 2/6.29 + 25.4$.

[4] Output black level/IRE = $\text{BLNNL} \times 2/6.18 + 25.9$; default after reset: 35h.

Table 54: CCR and blanking level VBI register, subaddress 5Fh, bit description

Bit	Symbol	Access	Value	Description
7 and 6	CCRS[1:0]	R/W		select cross-color reduction filter in luminance; for overall transfer characteristic of luminance see Figure 8
			00	no cross-color reduction
			01	cross-color reduction #1 active
			10	cross-color reduction #2 active
			11	cross-color reduction #3 active
5 to 0	BLNVB[5:0]	R/W	-	variable blanking level during vertical blanking interval is typically identical to value of BLNNL

Table 55: Standard control register, subaddress 61h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	DOWND	R/W		digital core
			0*	in normal operational mode
			1	in Sleep mode and is reactivated with an I ² C-bus address
6	DOWNA	R/W		DACs
			0*	in normal operational mode
			1	in Power-down mode
5	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
4	YGS	R/W		luminance gain for white – black
			0	100 IRE
			1	92.5 IRE including 7.5 IRE set-up of black
3	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
2	SCBW	R/W		bandwidth for chrominance encoding (for overall transfer characteristic of chrominance in baseband representation see Figure 6 and Figure 7)
			0	enlarged
			1*	standard
1	PAL	R/W		encoding
			0	NTSC (non-alternating V component)
			1	PAL (alternating V component)
0	FISE	R/W		total pixel clocks per line
			0	864
			1	858

Table 56: Burst amplitude register, subaddress 62h, bit description

Legend: * = default value after reset, ^ = recommended value.

Bit	Symbol	Access	Value	Description
7	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
6 to 0	BSTA[6:0]	R/W		amplitude of color burst; input representation in accordance with 'ITU-R BT.601'
			3Fh (63)^	white-to-black = 92.5 IRE; burst = 40 IRE; NTSC encoding; BSTA = 0 to 2.02 × nominal
			2Dh (45)^	white-to-black = 92.5 IRE; burst = 40 IRE; PAL encoding; BSTA = 0 to 2.82 × nominal
			43h (67)^	white-to-black = 100 IRE; burst = 43 IRE; NTSC encoding; BSTA = 0 to 1.90 × nominal
			2Fh (47)*^	white-to-black = 100 IRE; burst = 43 IRE; PAL encoding; BSTA = 0 to 3.02 × nominal

Table 57: Subcarrier 0, 1, 2 and 3 registers, subaddresses 63h to 66h, bit description

Subaddress	Bit	Symbol	Access	Value	Description
66h	7 to 0	FSC[31:24]	R/W	-	f_{fsc} = subcarrier frequency (in multiples of line frequency); f_{llc} = clock frequency (in multiples of line frequency); FSC[31:24] = most significant byte; FSC[07:00] = least significant byte [1]
65h	7 to 0	FSC[23:16]	R/W	-	
64h	7 to 0	FSC[15:08]	R/W	-	
63h	7 to 0	FSC[07:00]	R/W	-	

$$[1] \text{ FSC} = \text{round}\left(\frac{f_{fsc}}{f_{llc}} \times 2^{32}\right)$$

Examples:

a) NTSC M: $f_{fsc} = 227.5$, $f_{llc} = 1716 \rightarrow \text{FSC} = 569408543$ (21F0 7C1Fh).b) PAL B/G: $f_{fsc} = 283.7516$, $f_{llc} = 1728 \rightarrow \text{FSC} = 705268427$ (2A09 8ACBh).**Table 58: Line 21 odd 0, 1 and even 0, 1 registers, subaddresses 67h to 6Ah, bit description [1]**

Subaddress	Bit	Symbol	Access	Value	Description
67h	7 to 0	L21O[07:00]	R/W	-	first byte of captioning data, odd field
68h	7 to 0	L21O[17:10]	R/W	-	second byte of captioning data, odd field
69h	7 to 0	L21E[07:00]	R/W	-	first byte of extended data, even field
6Ah	7 to 0	L21E[17:10]	R/W	-	second byte of extended data, even field

[1] LSBs of the respective bytes are encoded immediately after run-in and framing code, the MSBs of the respective bytes have to carry the parity bit, in accordance with the definition of line 21 encoding format.

Table 59: Trigger control registers, subaddresses 6Ch and 6Dh, bit description

Legend: * = default value after reset.

Subaddress	Bit	Symbol	Access	Value	Description
6Ch	7 to 0	HTRIG[7:0]	R/W	00h*	sets the horizontal trigger phase related to chip-internal horizontal input [1]
6Dh	7 to 5	HTRIG[10:8]	R/W	0h*	
	4 to 0	VTRIG[4:0]	R/W	00h*	sets the vertical trigger phase related to chip-internal vertical input [2]

- [1] Values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed; increasing HTRIG decreases delays of all internally generated timing signals.
- [2] Increasing VTRIG decreases delays of all internally generated timing signals, measured in half lines; variation range of VTRIG = 0 to 31 (1Fh).

Table 60: Multi control register, subaddress 6Eh, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
6	BLCKON	R/W	0*	encoder in normal operation mode
			1	output signal is forced to blanking level
5 and 4	PHRES[1:0]	R/W		selects the phase reset mode of the color subcarrier generator
			00	no subcarrier reset
			01	subcarrier reset every two lines
			10	subcarrier reset every eight fields
			11	subcarrier reset every four fields
3 and 2	LDEL[1:0]	R/W		selects the delay on luminance path with reference to chrominance path
			00*	no luminance delay
			01	1 LLC luminance delay
			10	2 LLC luminance delay
			11	3 LLC luminance delay
1 and 0	FLC[1:0]	R/W		field length control
			00*	interlaced 312.5 lines/field at 50 Hz, 262.5 lines/field at 60 Hz
			01	non-interlaced 312 lines/field at 50 Hz, 262 lines/field at 60 Hz
			10	non-interlaced 313 lines/field at 50 Hz, 263 lines/field at 60 Hz
			11	non-interlaced 313 lines/field at 50 Hz, 263 lines/field at 60 Hz

Table 61: Closed caption, teletext enable register, subaddress 6Fh, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 and 6	CCEN[1:0]	R/W		enables individual line 21 encoding
			00*	line 21 encoding off
			01	enables encoding in field 1 (odd)
			10	enables encoding in field 2 (even)
			11	enables encoding in both fields

Table 61: Closed caption, teletext enable register, subaddress 6Fh, bit description
...continued

Bit	Symbol	Access	Value	Description
5	TTXEN	R/W		teletext insertion
			0*	disabled
			1	enabled
4 to 0	SCCLN[4:0]	R/W	-	selects the actual line, where closed caption or extended data are encoded; line = (SCCLN + 4) for M-systems; line = (SCCLN + 1) for other systems

Table 62: Active Display Window Horizontal (ADWH) start and end registers, subaddresses 70h to 72h, bit description

Subaddress	Bit	Symbol	Access	Value	Description
70h	7 to 0	ADWHS[7:0]	R/W	-	active display window horizontal start; defines the start of the active TV display portion after the border color [1]
71h	7 to 0	ADWHE[7:0]	R/W	-	active display window horizontal end; defines the end of the active TV display portion before the border color [1]
72h	7	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
	6 to 4	ADWHE[10:8]	R/W	-	active display window horizontal end; defines the end of the active TV display portion before the border color [1]
	3	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
	2 to 0	ADWHS[10:8]	R/W	-	active display window horizontal start; defines the start of the active TV display portion after the border color [1]

[1] Values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed.

Table 63: TTX request horizontal start register, subaddress 73h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 0	TTXHS[7:0]	R/W		start of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0); see Figure 15
			42h*	if strapped to PAL
			54h*	if strapped to NTSC

Table 64: TTX request horizontal delay register, subaddress 74h, bit description

Legend: * = default value after reset and minimum value.

Bit	Symbol	Access	Value	Description
7 to 4	-	R/W	0h	must be programmed with logic 0 to ensure compatibility to future enhancements
3 to 0	TTXHD[3:0]	R/W	2h*	indicates the delay in clock cycles between rising edge of TTXRQ output signal on pin TTXRQ_XCLKO2 (CLK2EN = 0) and valid data at pin TTX_SRES

Table 65: CSYNC advance register, subaddress 75h, bit description

Bit	Symbol	Access	Value	Description
7 to 3	CSYNCA[4:0]	R/W	-	advanced composite sync against RGB output from 0 XTAL clocks to 31 XTAL clocks
2 to 0	-	R/W	000	must be programmed with logic 0 to ensure compatibility to future enhancements

Table 66: TTX odd request vertical start register, subaddress 76h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 0	TTXOVS[7:0]	R/W		with TTXOVS8 (see Table 72) first line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in odd field, line = (TTXOVS + 4) for M-systems and line = (TTXOVS + 1) for other systems
			05h*	if strapped to PAL
			06h*	if strapped to NTSC

Table 67: TTX odd request vertical end register, subaddress 77h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 0	TTXOVE[7:0]	R/W		with TTXOVE8 (see Table 72) last line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in odd field, line = (TTXOVE + 3) for M-systems and line = TTXOVE for other systems
			16h*	if strapped to PAL
			10h*	if strapped to NTSC

Table 68: TTX even request vertical start register, subaddress 78h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 0	TTXEVS[7:0]	R/W		with TTXEVS8 (see Table 72) first line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in even field, line = (TTXEVS + 4) for M-systems and line = (TTXEVS + 1) for other systems
			04h*	if strapped to PAL
			05h*	if strapped to NTSC

Table 69: TTX even request vertical end register, subaddress 79h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7 to 0	TTXEVE[7:0]	R/W		with TTXEVE8 (see Table 72) last line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in even field, line = (TTXEVE + 3) for M-systems and line = TTXEVE for other systems
			16h*	if strapped to PAL
			10h*	if strapped to NTSC

Table 70: First active line register, subaddress 7Ah, bit description

Bit	Symbol	Access	Value	Description
7 to 0	FAL[7:0]	R/W		with FAL8 (see Table 72) first active line = (FAL + 4) for M-systems and (FAL + 1) for other systems, measured in lines
			00h	coincides with the first field synchronization pulse

Table 71: Last active line register, subaddress 7Bh, bit description

Bit	Symbol	Access	Value	Description
7 to 0	LAL[7:0]	R/W		with LAL8 (see Table 72) last active line = (LAL + 3) for M-systems and LAL for other system, measured in lines
			00h	coincides with the first field synchronization pulse

Table 72: TTX mode, MSB vertical register, subaddress 7Ch, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	TTX60	R/W	0*	enables NABTS (FISE = 1) or European TTX (FISE = 0)
			1	enables world standard teletext 60 Hz (FISE = 1)
6	LAL8	R/W		see Table 71
5	-	R/W	0	must be programmed with logic 0 to ensure compatibility to future enhancements
4	FAL8	R/W		see Table 70
3	TTXEVE8	R/W		see Table 69
2	TTXOVE8	R/W		see Table 67
1	TTXEVS8	R/W		see Table 68
0	TTXOVS8	R/W		see Table 66

Table 73: Disable TTX line registers, subaddresses 7Eh and 7Fh, bit description [1]

Subaddress	Bit	Symbol	Access	Value	Description
7Eh	7 to 0	LINE[12:5]	R/W	-	individual lines in both fields (PAL counting) can be disabled for insertion of teletext by the respective bits, disabled line = LINE _{xx} (50 Hz field rate)
7Fh	7 to 0	LINE[20:13]	R/W	-	

[1] This bit mask is effective only if the lines are enabled by TTXOVS/TTXOVE and TTXEVS/TTXEVE.

Table 74: Pixel clock 0, 1 and 2 registers, subaddresses 81h to 83h, bit description

Subaddress	Bit	Symbol	Access	Value	Description
81h	7 to 0	PCL[07:00]	R/W		defines the frequency of the synthesized pixel clock PIXCLKO;
82h	7 to 0	PCL[15:08]			
83h	7 to 0	PCL[23:16]			
					$f_{\text{PIXCLK}} = \left(\frac{\text{PCL}}{2^{24}} \times f_{\text{XTAL}} \right) \times 8;$
					$f_{\text{XTAL}} = 27 \text{ MHz nominal}$
20 F63Bh					640 × 480 to NTSC M
1B 5A73h					640 × 480 to PAL B/G (as by strapping pins)

Table 75: Horizontal offset register, subaddress 90h, bit description

Bit	Symbol	Description
7 to 0	XOFS[7:0]	with XOFS[9:8] (see Table 79) horizontal offset; defines the number of PIXCLKs from horizontal sync (HSVGC) output to composite blanking (CBO) output

Table 76: Pixel number register, subaddress 91h, bit description

Bit	Symbol	Description
7 to 0	XPIX[7:0]	with XPIX[9:8] (see Table 79) pixel in X direction; defines half the number of active pixels per input line (identical to the length of $\overline{\text{CBO}}$ pulses)

Table 77: Vertical offset odd register, subaddress 92h, bit description

Bit	Symbol	Description
7 to 0	YOFSO[7:0]	with YOFSO[9:8] (see Table 79) vertical offset in odd field; defines (in the odd field) the number of lines from VSVGC to first line with active $\overline{\text{CBO}}$; if no LUT data is requested, the first active $\overline{\text{CBO}}$ will be output at $\text{YOFSO} + 2$; usually, $\text{YOFSO} = \text{YOFSE}$ with the exception of extreme vertical downscaling and interlacing

Table 78: Vertical offset even register, subaddress 93h, bit description

Bit	Symbol	Description
7 to 0	YOFSE[7:0]	with YOFSE[9:8] (see Table 79) vertical offset in even field; defines (in the even field) the number of lines from VSVGC to first line with active $\overline{\text{CBO}}$; if no LUT data is requested, the first active $\overline{\text{CBO}}$ will be output at $\text{YOFSE} + 2$; usually, $\text{YOFSE} = \text{YOFSO}$ with the exception of extreme vertical downscaling and interlacing

Table 79: MSBs register, subaddress 94h, bit description

Bit	Symbol	Description
7 and 6	YOFSE[9:8]	see Table 78
5 and 4	YOFSO[9:8]	see Table 77
3 and 2	XPIX[9:8]	see Table 76
1 and 0	XOFS[9:8]	see Table 75

Table 80: Line number register, subaddress 95h, bit description

Bit	Symbol	Description
7 to 0	YPIX[7:0]	with YPIX[9:8] (see Table 81) defines the number of requested input lines from the feeding device; number of requested lines = $\text{YPIX} + \text{YOFSE} - \text{YOFSO}$

Table 81: Scaler CTRL, MCB and YPIX register, subaddress 96h, bit description

Bit	Symbol	Access	Value	Description
7	EFS	R/W		in Slave mode frame sync signal at pin FSVGC
			0	ignored
			1	accepted
6	PCBN	R/W		polarity of $\overline{\text{CBO}}$ signal
			0	normal (HIGH during active video)
			1	inverted (LOW during active video)
5	SLAVE	R/W		from the SAA7102; SAA7103 the timing to the graphics controller is
			0	master
			1	slave
4	ILC	R/W		if hardware cursor insertion is active
			0	set LOW for non-interlaced input signals
			1	set HIGH for interlaced input signals
3	YFIL	R/W		luminance sharpness booster
			0	disabled
			1	enabled
2	HSL	R/W		trigger event for the horizontal state machine (device is slave to HSVGC input)
			0	not shifted
			1	shifted 128 PIXCLKs adapted to a late HSVGC
1 and 0	YPIX[9:8]			see Table 80

Table 82: Sync control register, subaddress 97h, bit description

Bit	Symbol	Access	Value	Description
7	HFS	R/W		horizontal sync is derived from
			0	input signal (Slave mode) at pin HSVGC
			1	a frame sync signal (Slave mode) at pin FSVGC (only if EFS is set HIGH)
6	VFS	R/W		vertical sync (field sync) is derived from
			0	input signal (Slave mode) at pin VSVGC
			1	a frame sync signal (Slave mode) at pin FSVGC (only if EFS is set HIGH)
5	OFS	R/W		pin FSVGC is
			0	input
			1	active output
4	PFS	R/W		polarity of signal at pin FSVGC in output mode (Master mode) is
			0	active HIGH; rising edge of the input signal is used in Slave mode
			1	active LOW; falling edge of the input signal is used in Slave mode

Table 82: Sync control register, subaddress 97h, bit description ...continued

Bit	Symbol	Access	Value	Description
3	OVS	R/W		pin VSVG is
			0	input
			1	active output
2	PVS	R/W		polarity of signal at pin VSVG in output mode (Master mode) is
			0	active HIGH; rising edge of the input signal is used in Slave mode
			1	active LOW; falling edge of the input signal is used in Slave mode
1	OHS	R/W		pin HSVG is
			0	input
			1	active output
0	PHS	R/W		polarity of signal at pin HSVG in output mode (Master mode) is
			0	active HIGH; rising edge of the input signal is used in Slave mode
			1	active LOW; falling edge of the input signal is used in Slave mode

Table 83: Line length register, subaddress 98h, bit description

Bit	Symbol	Description
7 to 0	HLEN[7:0]	with HLEN[10:8] (see Table 84) horizontal length; $\text{HLEN} = \frac{\text{number of PIXCLKs}}{\text{line}} - 1$

Table 84: Input delay, MSB line length register, subaddress 99h, bit description

Bit	Symbol	Description
7 to 4	IDEL[3:0]	input delay; defines the distance in PIXCLKs between the active edge of CBO and the first received valid pixel
3	-	must be programmed with logic 0 to ensure compatibility to future enhancements
2 to 0	HLEN[10:8]	see Table 83

Table 85: Horizontal increment register, subaddress 9Ah, bit description

Bit	Symbol	Description
7 to 0	XINC[7:0]	with XINC[11:8] (see Table 87) incremental fraction of the horizontal scaling engine; $\text{XINC} = \frac{\frac{\text{number of output pixels}}{\text{line}}}{\frac{\text{number of input pixels}}{\text{line}}} \times 4096$

Table 86: Vertical increment register, subaddress 9Bh, bit description

Bit	Symbol	Description
7 to 0	YINC[7:0]	with YINC[11:8] (see Table 87) incremental fraction of the vertical scaling engine; $YINC = \frac{\text{number of active output lines}}{\text{number of active input lines}} \times 4096$

Table 87: MSBs vertical and horizontal increment register, subaddress 9Ch, bit description

Bit	Symbol	Description
7 to 4	YINC[11:8]	see Table 86
3 to 0	XINC[11:8]	see Table 85

Table 88: Weighting factor odd register, subaddress 9Dh, bit description

Bit	Symbol	Description
7 to 0	YIWGTO[7:0]	with YIWGTO[11:8] (see Table 90) weighting factor for the first line of the odd field; $YIWGTO = \frac{YINC}{2} + 2048$

Table 89: Weighting factor even, subaddress 9Eh, bit description

Bit	Symbol	Description
7 to 0	YIWGTE[7:0]	with YIWGTE[11:8] (see Table 90) weighting factor for the first line of the even field; $YIWGTE = \frac{YINC - YSKIP}{2}$

Table 90: Weighting factor MSB register, subaddress 9Fh, bit description

Bit	Symbol	Description
7 to 4	YIWGTE[11:8]	see Table 89
3 to 0	YIWGTO[11:8]	see Table 88

Table 91: Vertical line skip register, subaddress A0h, bit description

Bit	Symbol	Access	Value	Description
7 to 0	YSKIP[7:0]	R/W		with YSKIP[11:8] (see Table 92) vertical line skip; defines the effectiveness of the anti-flicker filter
			000h	most effective
			FFFh	anti-flicker filter switched off

Table 92: Blank enable for NI-bypass, vertical line skip MSB register, subaddress A1h, bit description

Legend: * = default value after reset.

Bit	Symbol	Access	Value	Description
7	BLEN	R/W		for non-interlaced graphics in bypass mode
			0*	no internal blanking
			1	forced internal blanking
6 to 4	-	R/W	000	must be programmed with logic 0 to ensure compatibility to future enhancements
3 to 0	YSKIP[11:8]	R/W		see Table 91

Table 93: Border color Y register, subaddress A2h, bit description

Bit	Symbol	Description
7 to 0	BCY[7:0]	luminance portion of border color in underscan area

Table 94: Border color U register, subaddress A3h, bit description

Bit	Symbol	Description
7 to 0	BCU[7:0]	color difference portion of border color in underscan area

Table 95: Border color V register, subaddress A4h, bit description

Bit	Symbol	Description
7 to 0	BCV[7:0]	color difference portion of border color in underscan area

Table 96: Cursor color 1 R, G and B registers, subaddresses F0h to F2h, bit description

Subaddress	Bit	Symbol	Description
F0h	7 to 0	CC1R[7:0]	RED portion of first cursor color
F1h	7 to 0	CC1G[7:0]	GREEN portion of first cursor color
F2h	7 to 0	CC1B[7:0]	BLUE portion of first cursor color

Table 97: Cursor color 2 R, G and B registers, subaddresses F3h to F5h, bit description

Subaddress	Bit	Symbol	Description
F3h	7 to 0	CC2R[7:0]	RED portion of second cursor color
F4h	7 to 0	CC2G[7:0]	GREEN portion of second cursor color
F5h	7 to 0	CC2B[7:0]	BLUE portion of second cursor color

Table 98: Auxiliary cursor color R, G and B registers, subaddresses F6h to F8h, bit description

Subaddress	Bit	Symbol	Description
F6h	7 to 0	AUXR[7:0]	RED portion of auxiliary cursor color
F7h	7 to 0	AUXG[7:0]	GREEN portion of auxiliary cursor color
F8h	7 to 0	AUXB[7:0]	BLUE portion of auxiliary cursor color

Table 99: Horizontal cursor position and horizontal hot spot, MSB XCP registers, subaddresses F9h and FAh, bit description

Subaddress	Bit	Symbol	Description
FAh	7 to 3	XHS[4:0]	horizontal hot spot of cursor
	2 to 0	XCP[10:8]	horizontal cursor position
F9h	7 to 0	XCP[7:0]	

Table 100: Vertical cursor position and vertical hot spot, MSB YCP registers, subaddresses FBh and FCh, bit description

Subaddress	Bit	Symbol	Description
FCh	7 to 3	YHS[4:0]	vertical hot spot of cursor
	2	-	must be programmed with logic 0 to ensure compatibility to future enhancements
	1 and 0	YCP[9:8]	vertical cursor position
FBh	7 to 0	YCP[7:0]	

Table 101: Input path control register, subaddress FDh, bit description

Bit	Symbol	Access	Value	Description
7	LUTOFF	R/W		color look-up table
			0	active
			1	bypassed
6	CMODE	R/W		cursor mode
			0	cursor mode; input color will be inverted
			1	auxiliary cursor color will be inserted
5	LUTL	R/W		LUT loading via input data stream
			0	inactive
			1	color and cursor LUTs are loaded
4 to 2	IF[2:0]	R/W		input format
			000	8 + 8 + 8-bit 4 : 4 : 4 non-interlaced RGB or C _B -Y-C _R
			001	5 + 5 + 5-bit 4 : 4 : 4 non-interlaced RGB
			010	5 + 6 + 5-bit 4 : 4 : 4 non-interlaced RGB
			011	8 + 8 + 8-bit 4 : 2 : 2 non-interlaced C _B -Y-C _R
			100	8 + 8 + 8-bit 4 : 2 : 2 interlaced C _B -Y-C _R (ITU-R BT.656, 27 MHz clock) (in subaddresses 91h and 94h set XPIX = number of active pixels/line)
			101	8-bit non-interlaced index color
			110	8 + 8 + 8-bit 4 : 4 : 4 non-interlaced RGB or C _B -Y-C _R (special bit ordering)
1	MATOFF	R/W		RGB to C _R -Y-C _B matrix
			0	active
			1	bypassed
0	DFOFF	R/W		down formatter
			0	(4 : 4 : 4 to 4 : 2 : 2) in input path is active
			1	bypassed

Table 102: Cursor bit map register, subaddress FEh, bit description

Data byte	Description
CURSA	RAM start address for cursor bit map; the byte following subaddress FEh points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition

Table 103: Color look-up table register, subaddress FFh, bit description

Data byte	Description
COLSA	RAM start address for color LUT; the byte following subaddress FFh points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition

In subaddresses 5Bh, 5Ch, 5Dh, 5Eh and 62h all IRE values are rounded up.

8.4 Slave transmitter

Table 104: Status byte register, subaddress 00h, bit description

Bit	Symbol	Access	Value	Description
7 to 5	VER[2:0]	R	101	version identification of the device: it will be changed with all versions of the IC that have different programming models; current version is 010 binary
4	CCRDO	R	1	set immediately after the closed caption bytes of the odd field have been encoded
			0	reset after information has been written to the subaddresses 67h and 68h

9. Limiting values

Table 108: Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134). All ground pins connected together and grounded (0 V); all supply pins connected together.

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DDD}	digital supply voltage		-0.5	+4.6	V
V _{DDA}	analog supply voltage		-0.5	+4.6	V
V _{i(A)}	input voltage at analog inputs		-0.5	+4.6	V
V _{i(n)}	input voltage at pins XTALI, SDA and SCL		-0.5	V _{DDD} + 0.5	V
V _{i(D)}	input voltage at digital inputs or I/O pins	outputs in 3-state	-0.5	+4.6	V
		outputs in 3-state	[1] -0.5	+5.5	V
ΔV _{SS}	voltage difference between V _{SSA(n)} and V _{SSD(n)}		-	100	mV
T _{stg}	storage temperature		-65	+150	°C
T _{amb}	ambient temperature		0	70	°C
V _{esd}	electrostatic discharge voltage	human body model	[2] -	±2000	V
		machine model	[3] -	±150	V

[1] Condition for maximum voltage at digital inputs or I/O pins: 3.0 V < V_{DDD} < 3.6 V.

[2] Class 2 according to JESD22-A114-B.

[3] Class A according to EIA/JESD22-A115-A.

10. Thermal characteristics

Table 109: Thermal characteristics

Symbol	Parameter	Conditions	Typ	Unit
R _{th(j-a)}	thermal resistance from junction to ambient			
	SAA7102E	in free air	[1] 38	K/W
	SAA7103E	in free air	[1] 38	K/W
	SAA7102H	in free air	[1] 53	K/W
	SAA7103H	in free air	[1] 53	K/W

[1] The overall R_{th(j-a)} value can vary depending on the board layout. To minimize the effective R_{th(j-a)} all power and ground pins must be connected to the power and ground layers directly. An ample copper area directly under the SAA7102; SAA7103 with a number of through-hole plating, connected to the ground layer (four-layer board: second layer), can also reduce the effective R_{th(j-a)}. Please do not use any solder-stop varnish under the chip. In addition the usage of soldering glue with a high thermal conductance after curing is recommended.

11. Characteristics

Table 110: Characteristics
 $V_{DD} = 3.0\text{ V to }3.6\text{ V}$; $T_{amb} = 0\text{ }^{\circ}\text{C to }70\text{ }^{\circ}\text{C}$ (typical values excluded); unless otherwise specified.

B_{DAC}	output signal bandwidth of DACs	-3 dB	15	-	-	MHz
$ILE_{lf(DAC)}$	low frequency integral linearity error of DACs		-	-	± 3	LSB
$DLE_{lf(DAC)}$	low frequency differential linearity error of DACs		-	-	± 1	LSB

[1] Minimum value for I²C-bus bit DOWNA = 1.[2] Minimum value for I²C-bus bit DOWND = 1.

[3] The data is for both input and output direction.

[4] This parameter is arbitrary, if PIXCLKI is looped through the VGC.

[5] If an internal oscillator is used, crystal deviation of nominal frequency is directly proportional to the deviation of subcarrier frequency and line/field frequency.

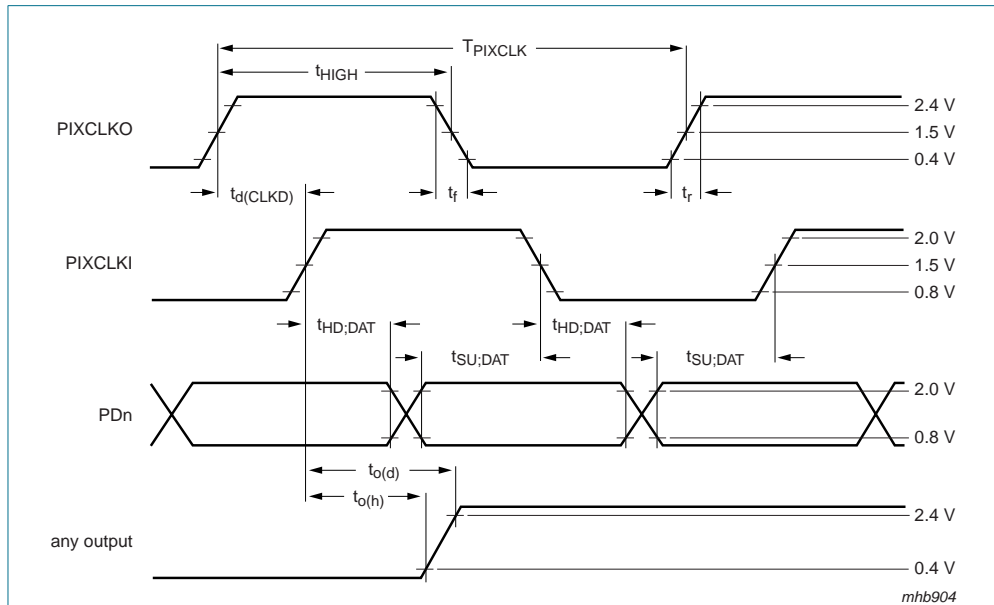

Fig 12. Input/output timing specification

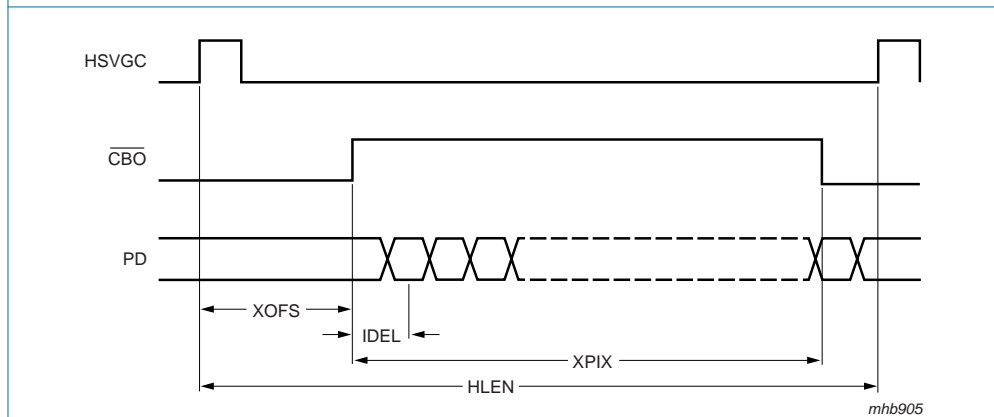

Fig 13. Horizontal input timing

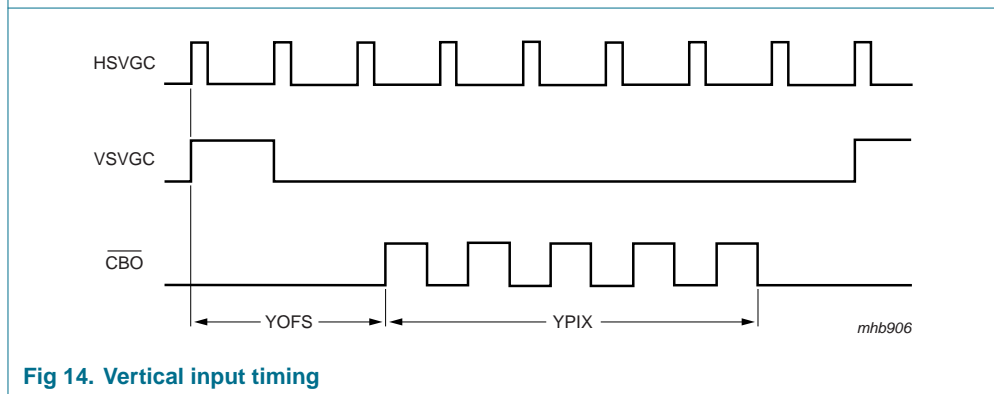

Fig 14. Vertical input timing

11.1 Teletext timing

Time t_{FD} is the time needed to interpolate input data TTX and insert it into the CVBS and VBS output signal, such that it appears at $t_{TTX} = 9.78 \mu\text{s}$ (PAL) or $t_{TTX} = 10.5 \mu\text{s}$ (NTSC) after the leading edge of the horizontal synchronization pulse.

Time t_{PD} is the pipeline delay time introduced by the source that is gated by TTXRQ_XCLKO2 in order to deliver TTX data. This delay is programmable by register TTXHD. For every active HIGH state at output pin TTXRQ_XCLKO2, a new teletext bit must be provided by the source.

Since the beginning of the pulses representing the TTXRQ signal and the delay between the rising edge of TTXRQ and valid teletext input data are fully programmable (TTXHS and TTXHD), the TTX data is always inserted at the correct position after the leading edge of the outgoing horizontal synchronization pulse.

Time $t_{i(TTXW)}$ is the internally used insertion window for TTX data; it has a constant length that allows insertion of 360 teletext bits at a text data rate of 6.9375 Mbit/s (PAL), 296 teletext bits at a text data rate of 5.7272 Mbit/s (world standard TTX) or 288 teletext bits at a text data rate of 5.7272 Mbit/s (NABTS). The insertion window is not opened if the control bit TTXEN is zero.

Using appropriate programming, all suitable lines of the odd field (TTXOVS and TTXOVE) plus all suitable lines of the even field (TTXEVS and TTXEVE) can be used for teletext insertion.

It is essential to note that the two pins used for teletext insertion must be configured for this purpose by the correct I²C-bus register settings.

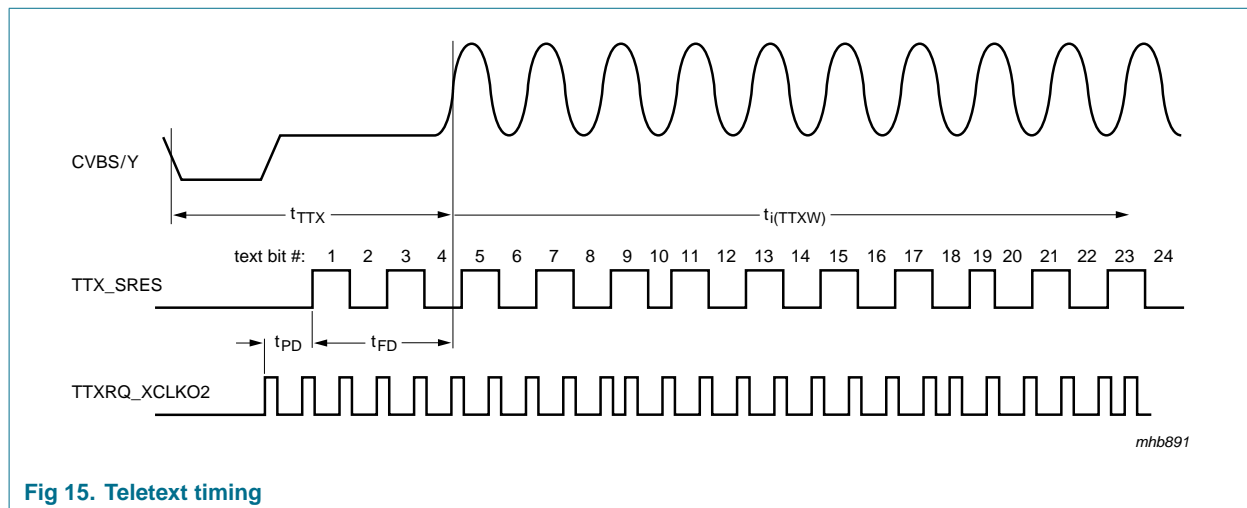

Fig 15. Teletext timing

12. Application information

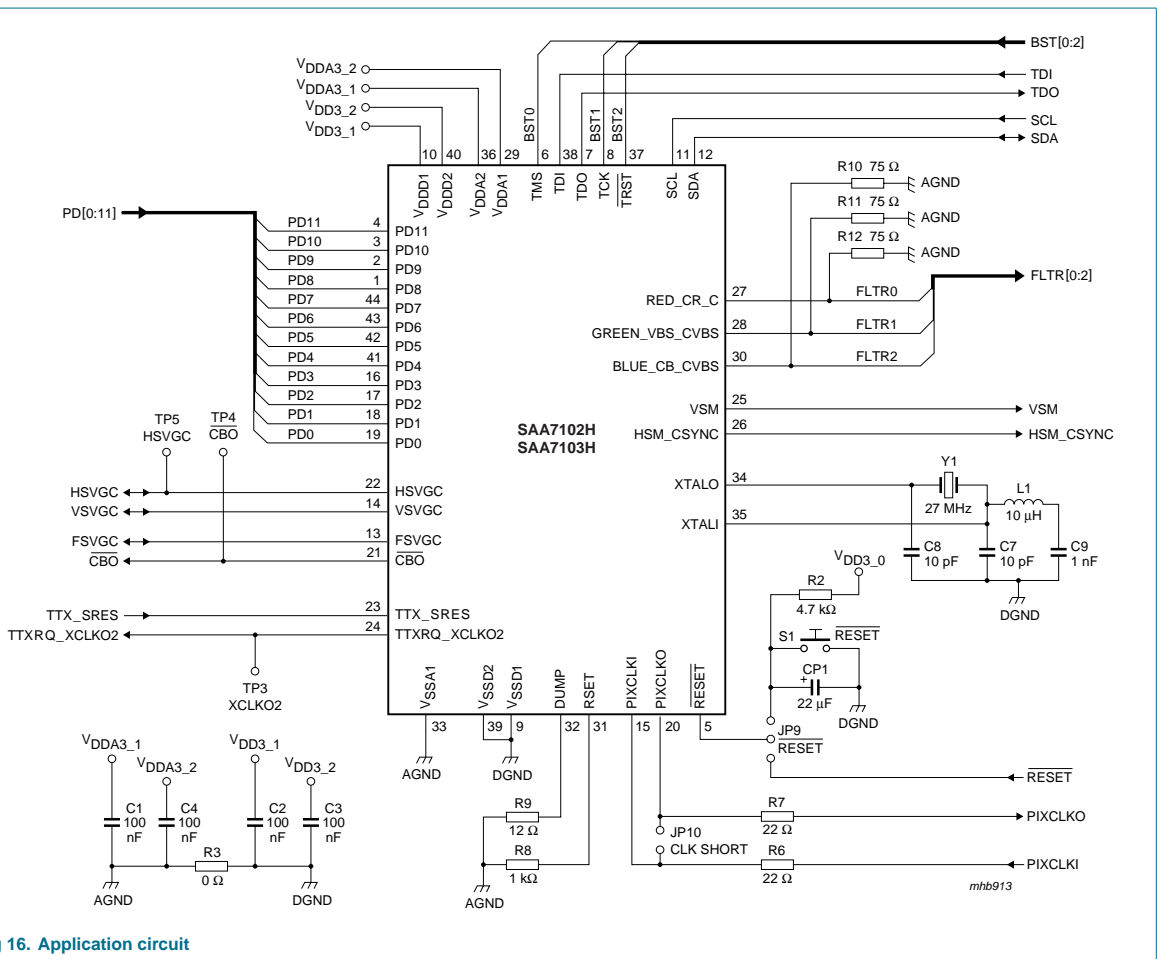

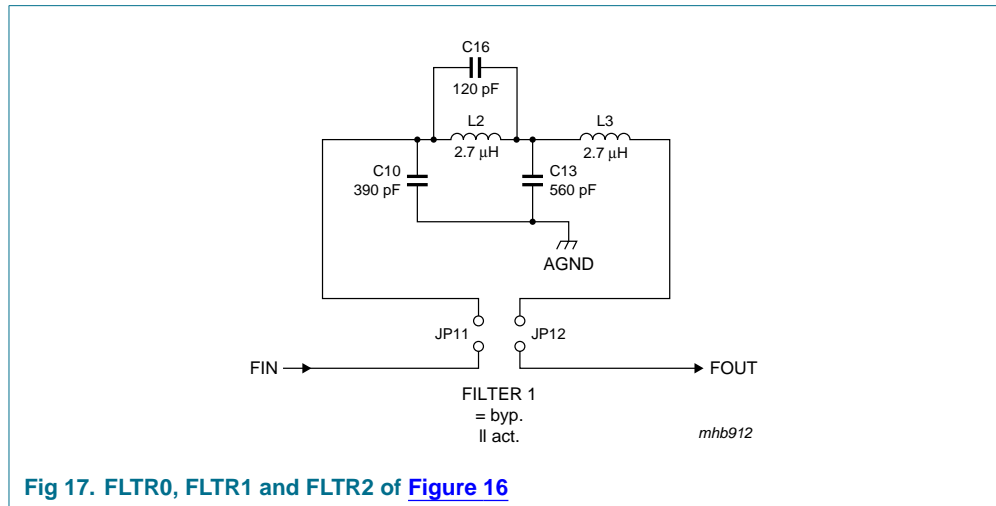

Fig 16. Application circuit

12.1 Analog output voltages

The analog output voltages are dependent on the total load (typical value 37.5 Ω), the digital gain parameters and the I²C-bus settings of the DAC reference currents (analog settings).

The digital output signals in front of the DACs under nominal (nominal here stands for the settings given in [Table 52](#) to [Table 56](#) for example a standard PAL or NTSC signal) conditions occupy different conversion ranges, as indicated in [Table 111](#) for a $100/100$ color bar signal.

By setting the reference currents of the DACs as shown in [Table 111](#), standard compliant amplitudes can be achieved for all signal combinations; it is assumed that in subaddress 16h, parameter DACF = 0000b, that means the fine adjustment for all DACs in common is set to 0 %.

If S-video output is desired, the adjustment for the C (chrominance subcarrier) output should be identical to the one for VBS (luminance plus sync) output.

Table 111: Digital output signals conversion range

Set/out	CVBS, sync tip-to-white	VBS, sync tip-to-white	RGB, black-to-white
Digital settings	see Table 52 to Table 56	see Table 52 to Table 56	see Table 46 and Table 47
Digital output	1014	881	876
Analog settings	e.g. B DAC = 1Fh	e.g. G DAC = 1Bh	e.g. R DAC = G DAC = B DAC = 0Bh
Analog output	1.23 V (p-p)	1.00 V (p-p)	0.70 V (p-p)

12.2 Suggestions for a board layout

Use separate ground planes for analog and digital ground. Connect these planes only at one point directly under the device, by using a 0 Ω resistor directly at the supply stage. Use separate supply lines for the analog and digital supply. Place the supply decoupling capacitors close to the supply pins.

Use L_{bead} (ferrite coil) in each digital supply line close to the decoupling capacitors to minimize radiation energy (EMC).

Place the analog coupling (clamp) capacitors close to the analog input pins. Place the analog termination resistors close to the coupling capacitors.

Be careful of hidden layout capacitors around the crystal application.

Use serial resistors in clock, sync and data lines, to avoid clock or data reflection effects and to soften data energy.

13. Test information

13.1 Boundary scan test

The SAA7102; SAA7103 has built-in logic and 5 dedicated pins to support boundary scan testing which allows board testing without special hardware (nails). The SAA7102; SAA7103 follows the "IEEE Std. 1149.1 - Standard Test Access Port and Boundary-Scan Architecture" set by the Joint Test Action Group (JTAG) chaired by Philips.

The 5 special pins are Test Mode Select (TMS), Test Clock (TCK), Test Reset ($\overline{\text{TRST}}$), Test Data Input (TDI) and Test Data Output (TDO).

The Boundary Scan Test (BST) functions BYPASS, EXTEST, SAMPLE, CLAMP and IDCODE are all supported; see [Table 112](#). Details about the JTAG BST-TEST can be found in the specification "IEEE Std. 1149.1". A file containing the detailed Boundary Scan Description Language (BSDL) of the SAA7102; SAA7103 is available on request.

Table 112: BST instructions supported by the SAA7102; SAA7103

Instruction	Description
BYPASS	This mandatory instruction provides a minimum length serial path (1 bit) between TDI and TDO when no test operation of the component is required.
EXTEST	This mandatory instruction allows testing of off-chip circuitry and board level interconnections.
SAMPLE	This mandatory instruction can be used to take a sample of the inputs during normal operation of the component. It can also be used to preload data values into the latched outputs of the boundary scan register.
CLAMP	This optional instruction is useful for testing when not all ICs have BST. This instruction addresses the bypass register while the boundary scan register is in external test mode.
IDCODE	This optional instruction will provide information on the components manufacturer, part number and version number.

13.1.1 Initialization of boundary scan circuit

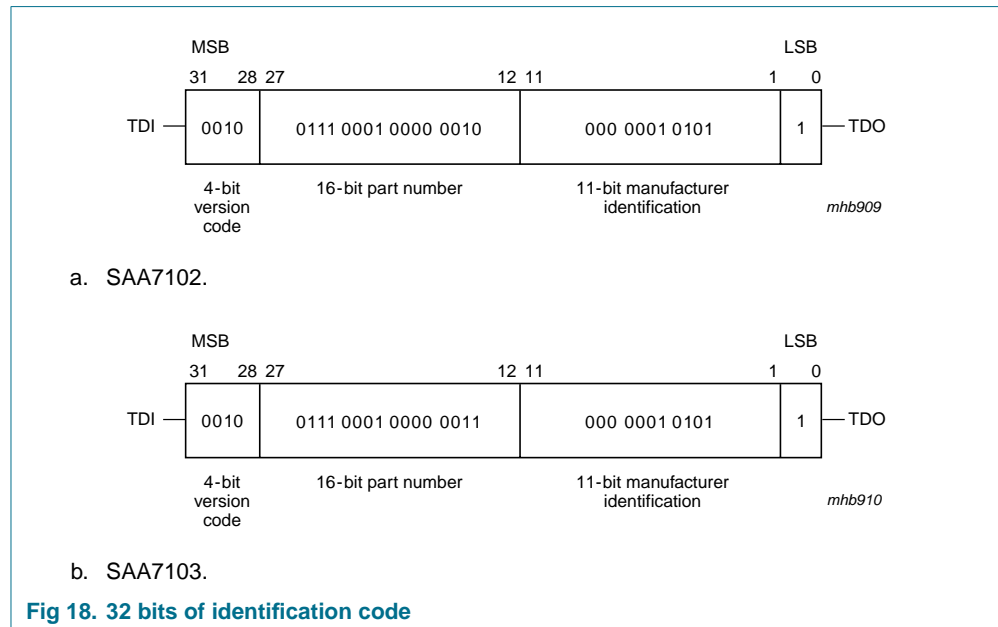

The Test Access Port (TAP) controller of an IC should be in the reset state (TEST_LOGIC_RESET) when the IC is in functional mode. This reset state also forces the instruction register into a functional instruction such as IDCODE or BYPASS.

To solve the power-up reset, the standard specifies that the TAP controller will be forced asynchronously to the TEST_LOGIC_RESET state by setting the $\overline{\text{TRST}}$ pin LOW.

13.1.2 Device identification codes

A device identification register is specified in “*IEEE Std. 1149.1b-1994*”. It is a 32-bit register which contains fields for the specification of the IC manufacturer, the IC part number and the IC version number. Its biggest advantage is the possibility to check for the correct ICs mounted after production and to determine the version number of the ICs during field service.

When the IDCODE instruction is loaded into the BST instruction register, the identification register will be connected between pins TDI and TDO of the IC. The identification register will load a component specific code during the CAPTURE_DATA_REGISTER state of the TAP controller, this code can subsequently be shifted out. At board level this code can be used to verify component manufacturer, type and version number. The device identification register contains 32 bits, numbered 31 to 0, where bit 31 is the most significant bit (nearest to TDI) and bit 0 is the least significant bit (nearest to TDO); see [Figure 18](#).

SOT307-2

Fig 20. Package outline SOT307-2 (QFP44)

15. Soldering

15.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

15.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON..T and SSOP..T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

15.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;

- smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

15.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

15.5 Package related soldering information

Table 113: Suitability of surface mount IC packages for wave and reflow soldering methods

Package ^[1]	Soldering method	
	Wave	Reflow ^[2]
BGA, HTSSON..T ^[3] , LBGA, LFBGA, SQFP, SSOP..T ^[3] , TFBGA, VFBGA, XSON	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ^[4]	suitable
PLCC ^[5] , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ^[5] ^[6]	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ^[7]	suitable
CWQCCN..L ^[8] , PMFP ^[9] , WQCCN..L ^[8]	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note (AN01026)*; order a copy from your Philips Semiconductors sales office.

[2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.

[3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding 217 °C ± 10 °C measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.

- [4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- [5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- [6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- [7] Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- [8] Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- [9] Hot bar soldering or manual soldering is suitable for PMFP packages.

17. Data sheet status

Level	Data sheet status [1]	Product status [2] [3]	Definition
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

[1] Please consult the most recently issued data sheet before initiating or completing a design.

[2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.

[3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

18. Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

ICs with Macrovision copyright protection technology — This product incorporates copyright protection technology that is protected by method claims of certain U.S. patents and other intellectual property rights owned by Macrovision Corporation and other rights owners. Use of this copyright protection technology must be authorized by Macrovision Corporation and is intended for home and other limited viewing uses only, unless otherwise authorized by Macrovision Corporation. Reverse engineering or disassembly is prohibited.

19. Disclaimers

Life support — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

20. Trademarks

7	Functional description	7	15.3	Wave soldering	80
7.1	Reset conditions	9	15.4	Manual soldering	81
7.2	Input formatter	9	15.5	Package related soldering information	81
7.3	RGB LUT	9	16	Revision history	82
7.4	Cursor insertion	10	17	Data sheet status	83
7.5	RGB Y-C _B -C _R matrix	11	18	Definitions	83
7.6	Horizontal scaler	11	19	Disclaimers	83
7.7	Vertical scaler and anti-flicker filter	11	20	Trademarks	83
7.8	FIFO	12	21	Contact information	83
7.9	Border generator	12			
7.10	Oscillator and Discrete Time Oscillator (DTO)	12			
7.11	Low-pass Clock Generation Circuit (CGC)	12			
7.12	Encoder	12			
7.12.1	Video path	12			
7.12.2	Teletext insertion and encoding (not simultaneously with real-time control)	13			
7.12.3	Video Programming System (VPS) encoding	13			
7.12.4	Closed caption encoder	13			
7.12.5	Anti-taping (SAA7102 only)	14			
7.13	RGB processor	14			
7.14	Triple DAC	14			
7.15	Timing generator	14			
7.16	I ² C-bus interface	15			
7.17	Programming the SAA7102; SAA7103	16			
7.18	Input levels and formats	18			
8	Register description	40			
8.1	Bit allocation map	40			
8.2	I ² C-bus format	44			
8.3	Slave receiver	45			
8.4	Slave transmitter	64			
9	Limiting values	69			
10	Thermal characteristics	69			
11	Characteristics	70			
11.1	Teletext timing	73			
12	Application information	74			
12.1	Analog output voltages	75			
12.2	Suggestions for a board layout	75
