Advance Information

MPC8272EC Rev. 0.2 12/2003

MPC8272 PowerQUICC II™ Family Hardware Specifications

This hardware specification contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications for the MPC8272 family of devices—the MPC8272, the MPC8248, the MPC8271, and the MPC8247. These devices are .13µm (HiP7) members of the PowerQUICC IITM family of integrated communications processors. They include on a single chip a 32-bit PowerPC core that incorporates memory management units (MMUs) and instruction and data caches and that implements the PowerPC instruction set; a modified communications processor module (CPM); and an integrated security engine (SEC) for encryption (the MPC8272 and the MPC8248 only).

All four devices are collectively referred to throughout this hardware specification as 'the MPC8272' unless otherwise noted. The following topics are addressed:

Topic	Page
Section 1, "Overview"	2
Section 2, "Operating Conditions"	7
Section 3, "DC Electrical Characteristics"	8
Section 4, "Thermal Characteristics"	11
Section 5, "Power Dissipation"	14
Section 6, "AC Electrical Characteristics"	14
Section 7, "Clock Configuration Modes"	22
Section 8, "Pinout"	39
Section 9, "Package"	51
Section 10, "Ordering Information"	53
Section 11, "Document Revision History"	53

PRELIMINARY—SUBJECT TO CHANGE WITHOUT NOTICE

1 Overview

Table 1 shows the functionality supported by each device in the MPC8272 family.

Table 1. MPC8272 PowerQUICC II Family Functionality

			Devices		
Functionality		MPC8272	MPC8248	MPC8271	MPC8247
	Package ¹		516 F	PBGA	
Serial communications controllers (SCC	Cs)	3	3	3	3
QUICC multi-channel controller (QMC)		Yes	Yes	Yes	Yes
Fast communication controllers (FCCs)		2	2	2	2
I-Cache (Kbyte)		16	16	16	16
D-Cache (Kbyte)		16	16	16	16
Ethernet (10/100)		2	2	2	2
UTOPIA II Ports		1	0	1	0
Multi-channel controllers (MCCs)		0	0	0	0
PCI bridge		Yes	Yes	Yes	Yes
Transmission convergence (TC) layer		_	_	_	_
Inverse multiplexing for ATM (IMA)		_	_	_	_
Universal serial bus (USB) 2.0 full/low r	ate	1	1	1	1
Security engine (SEC)		Yes	Yes	_	_

¹ Refer to Table 2.

Devices in the MPC8272 family are available in two packages—the VR or ZQ package—as shown in Table 2. For package ordering information, refer to Section 10, "Ordering Information."

Table 2. MPC8272 PowerQUICC II Device Packages

Code (Package)	VR (516 PBGA—Lead free)	ZQ (516 PBGA—Lead spheres)
	MPC8272VR	MPC8272ZQ
Device	MPC8248VR	MPC8248ZQ
Device	MPC8271VR	MPC8271ZQ
	MPC8247VR	MPC8247ZQ

Figure 1 shows the block diagram of the MPC8272.

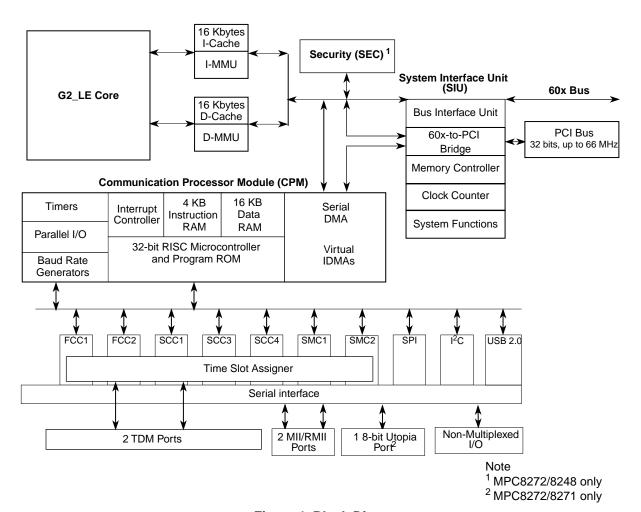

Figure 1. Block Diagram

1.1 Features

The major features of the MPC8272 are as follows:

- Dual-issue integer (G2 LE) core
 - A core version of the MPC603e microprocessor
 - System core microprocessor supporting frequencies of 266-400 MHz
 - Separate 16-Kbyte data and instruction caches:
 - Four-way set associative
 - Physically addressed
 - LRU replacement algorithm
 - PowerPC architecture-compliant memory management unit (MMU)
 - Common on-chip processor (COP) test interface
 - Supports bus snooping for cache coherency
 - Floating-point unit (FPU) supports floating-point arithmetic
 - Support for cache locking
- Low-power consumption
- Separate power supply for internal logic (1.5 V) and for I/O (3.3 V)

Overview

- Separate PLLs for G2 LE core and for the communications processor module (CPM)
 - G2_LE core and CPM can run at different frequencies for power/performance optimization
 - Internal core/bus clock multiplier that provides 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 4.5:1, 5:1, 5:5:1, 6:1, 7:1, and 8:1 ratios
 - Internal CPM/bus clock multiplier that provides 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 5:1, and 6:1 ratios
- 64-bit data and 32-bit address 60x bus
 - Bus supports multiple master designs—up to two external masters
 - Supports single transfers and burst transfers
 - 64-, 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
- 60x-to-PCI bridge
 - Programmable host bridge and agent
 - 32-bit data bus, 66 MHz, 3.3 V
 - Synchronous and asynchronous 60x and PCI clock modes
 - All internal address space available to external PCI host
 - DMA for memory block transfers
 - PCI-to-60x address remapping
- System interface unit (SIU)
 - Clock synthesizer
 - Reset controller
 - Real-time clock (RTC) register
 - Periodic interrupt timer
 - Hardware bus monitor and software watchdog timer
 - IEEE 1149.1 JTAG test access port
- Eight bank memory controller
 - Glueless interface to SRAM, page mode SDRAM, DRAM, EPROM, Flash, and other user-definable peripherals
 - Byte write enables
 - 32-bit address decodes with programmable bank size
 - Three user programmable machines, general-purpose chip-select machine, and page mode pipeline SDRAM machine
 - Byte selects for 64-bit bus width (60x)
 - Dedicated interface logic for SDRAM
- Disable CPU mode
- Integrated security engine (SEC) (MPC8272 and MPC8248 only)
 - Supports DES, 3DES, MD-5, SHA-1, AES, PKEU, RNG and RC-4 encryption algorithms in hardware
- Communications processor module (CPM)
 - Embedded 32-bit communications processor (CP) uses a RISC architecture for flexible support for communications peripherals
 - Interfaces to G2_LE core through on-chip dual-port RAM and DMA controller. (Dual-port RAM size is 16 Kbyte plus 4Kbyte dedicated instruction RAM.)

- Universal serial bus (USB) controller
 - Supports USB 2.0 full/low rate compatible
 - USB host mode
 - Supports control, bulk, interrupt, and isochronous data transfers
 - CRC16 generation and checking
 - NRZI encoding/decoding with bit stuffing
 - Supports both 12- and 1.5-Mbps data rates (automatic generation of preamble token and data rate configuration). Note that low-speed operation requires an external hub.
 - Flexible data buffers with multiple buffers per frame
 - Supports local loopback mode for diagnostics (12 Mbps only)
 - Supports USB slave mode
 - Four independent endpoints support control, bulk, interrupt, and isochronous data transfers
 - CRC16 generation and checking
 - CRC5 checking
 - NRZI encoding/decoding with bit stuffing
 - 12- or 1.5-Mbps data rate
 - Flexible data buffers with multiple buffers per frame
 - Automatic retransmission upon transmit error
 - Serial DMA channels for receive and transmit on all serial channels
 - Parallel I/O registers with open-drain and interrupt capability
 - Virtual DMA functionality executing memory-to-memory and memory-to-I/O transfers
 - Two fast communication controllers (FCCs) supporting the following protocols:
 - 10-/100-Mbit Ethernet/IEEE 802.3 CDMA/CS interface through media independent interface (MII)
 - Transparent
 - HDLC—up to T3 rates (clear channel)
 - One of the FCCs supports ATM (MPC8272 and MPC8271 only)—full-duplex SAR at 155 Mbps, 8-bit UTOPIA interface 31 Mphys, AAL5, AAL1, AAL2, AAL0 protocols, TM 4.0 CBR, VBR, UBR, ABR traffic types, up to 64-K external connections
 - Three serial communications controllers (SCCs) identical to those on the MPC860 supporting the digital portions of the following protocols:
 - Ethernet/IEEE 802.3 CDMA/CS
 - HDLC/SDLC and HDLC bus
 - Universal asynchronous receiver transmitter (UART)
 - Synchronous UART
 - Binary synchronous (BiSync) communications
 - Transparent
 - QUICC multichannel controller (QMC) up to 64 channels
 - Independent transmit and receive routing, frame synchronization.
 - Serial-multiplexed (full-duplex) input/output 2048-, 1544-, and 1536-Kbps PCM highways

- Compatible with T1/DS1 24-channel and CEPT E1 32-channel PCM highway, ISDN basic rate, ISDN primary rate, and user defined.
- Subchanneling on each time slot.
- Independent transmit and receive routing, frame synchronization and clocking
- Concatenation of any not necessarily consecutive time slots to channels independently for Rx/Tx
- Supports H1,H11, and H12 channels
- Allows dynamic allocation of channels
- SCC3 in NMSI mode is not usable when USB is enabled.
- Two serial management controllers (SMCs), identical to those of the MPC860
 - Provides management for BRI devices as general-circuit interface (GCI) controllers in time-division-multiplexed (TDM) channels
 - Transparent
 - UART (low-speed operation)
- One serial peripheral interface identical to the MPC860 SPI
- One I²C controller (identical to the MPC860 I²C controller)
 - Microwire compatible
 - Multiple-master, single-master, and slave modes
- Up to two TDM interfaces
 - Supports one group of two TDM channels
 - 1024 bytes of SI RAM
- Eight independent baud rate generators and 14 input clock pins for supplying clocks to FCC, SCC, SMC, and USB serial channels
- Four independent 16-bit timers that can be interconnected as two 32-bit timers
- PCI bridge
 - PCI Specification revision 2.2-compliant and supports frequencies up to 66 MHz
 - On-chip arbitration
 - Support for PCI to 60x memory and 60x memory to PCI streaming
 - PCI host bridge or peripheral capabilities
 - Includes four DMA channels for the following transfers:
 - PCI-to-60x to 60x-to-PCI
 - 60x-to-PCI to PCI-to-60x
 - PCI-to-60x to PCI-to-60x
 - 60x-to-PCI to 60x-to-PCI
 - Includes the configuration registers required by the PCI standard (which are automatically loaded from the EPROM to configure the MPC8272) and message and doorbell registers
 - Supports the I₂O standard
 - Hot-Swap friendly (supports the Hot Swap Specification as defined by PICMG 2.1 R1.0 August 3, 1998)
 - Support for 66-MHz, 3.3-V specification
 - 60x-PCI bus core logic, which uses a buffer pool to allocate buffers for each port

2 Operating Conditions

Table 3 shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings ¹

Rating	Symbol	Value	Unit
Core supply voltage ²	VDD	-0.3 - 2.25	V
PLL supply voltage ²	VCCSYN	-0.3 - 2.25	V
I/O supply voltage ³	VDDH	-0.3 - 4.0	V
Input voltage ⁴	VIN	GND(-0.3) - 3.6	V
Junction temperature	T _j	120	°C
Storage temperature range	T _{STG}	(-55) - (+150)	°C

Absolute maximum ratings are stress ratings only; functional operation (see Table 4) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

Table 4 lists recommended operational voltage conditions.

Table 4. Recommended Operating Conditions ¹

Rating	Symbol	Value	Unit
Core supply voltage	VDD	1.45 – 1.60	V
PLL supply voltage	VCCSYN	1.45 – 1.60	V
I/O supply voltage	VDDH	3.135 – 3.465	V
Input voltage	VIN	GND (-0.3) - 3.465	V
Junction temperature (maximum)	Tj	105 ²	°C
Ambient temperature	T _A	0-70 ²	°C

Caution: These are the recommended and tested operating conditions. Proper operation outside of these conditions is not guaranteed.

NOTE: Core, PLL, and I/O Supply Voltages

VDDH, VCCSYN, and VDD must track each other and must vary in the same direction—either in the positive direction (+0.165 VDDH and +0.075 VDD) or in the negative direction (-0.165 VDDH and -0.075 VDD).

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or V_{CC}).

² Caution: VDD/VCCSYN must not exceed VDDH by more than 0.4 V at any time, including during power-on reset.

Caution: VDDH can exceed VDD/VCCSYN by 3.3 V during power on reset by no more than 100 mSec. VDDH should not exceed VDD/VCCSYN by more than 2.5 V during normal operation.

⁴ Caution: VIN must not exceed VDDH by more than 2.5 V at any time, including during power-on reset.

 $^{^{2}}$ Note that for extended temperature parts the range is $(-40)_{T_{A}}$ – $105_{T_{I}}$.

DC Electrical Characteristics

Figure 2 shows the undershoot and overshoot voltage of the 60x bus memory interface of the MPC8272. Note that in PCI mode the I/O interface is different.

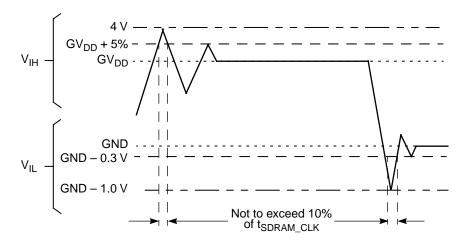

Figure 2. Overshoot/Undershoot Voltage

3 DC Electrical Characteristics

Table 5 shows DC electrical characteristics.

Table 5. DC Electrical Characteristics ¹

Characteristic	Symbol	Min	Max	Unit
Input high voltage— all inputs except TRST and PORESET ²	V _{IH}	2.0	3.465	V
Input low voltage	V _{IL}	GND	0.8	V
CLKIN input high voltage	V _{IHC}	2.4	3.465	V
CLKIN input low voltage	V _{ILC}	GND	0.4	V
Input leakage current, V _{IN} = VDDH ³	I _{IN}	_	10	μΑ
Hi-Z (off state) leakage current, V _{IN} = VDDH ³	I _{OZ}	_	10	μΑ
Signal low input current, V _{IL} = 0.8 V	IL	_	1	μΑ
Signal high input current, V _{IH} = 2.0 V	I _H	_	1	μΑ
Output high voltage, I _{OH} = -2 mA except UTOPIA mode, and open drain pins In UTOPIA mode ⁴ (UTOPIA pins only): I _{OH} = -8.0mA PA[8–31] PB[18–31] PC[0–1,4–29] PD[7–25, 29–31]	V _{ОН}	2.4	_	V
In UTOPIA mode ⁴ (UTOPIA pins only): I _{OL} = 8.0mA PA[8–31] PB[18–31] PC[0–1,4–29] PD[7–25, 29–31]	V _{OL}	_	0.5	V

DC Electrical Characteristics

Table 5. DC Electrical Characteristics ¹ (continued)

Characteristic	Symbol	Min	Max	Unit
Iol = 5.3mA	Vol		0.4	V

The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

 $^{^2}$ $\,\overline{\mbox{TRST}}$ and $\,\overline{\mbox{PORESET}}$ should be tied to VDDH via a 2K Ω external pull-up resistor.

³ The leakage current is measured for nominal VDDH, VCCSYN, and VDD.

⁴ MPC8272 and MPC8271 only.

4 Thermal Characteristics

Table 6 describes thermal characteristics. Refer to Table 2 for information on a given device's package. Discussions of each characteristic are provided in sections 4.1 through 4.7. For the these discussions, $P_D = (V_{DD} \times I_{DD}) + PI/O$, where PI/O is the power dissipation of the I/O drivers.

Table 6. Thermal Characteristics

Characteristic	Symbol	Value	Unit	Air Flow
Junction-to-ambient— 27 single-layer board ¹ R _{θJA} 21		2000	Natural convection

Junction-to-case ³	$R_{\theta JC}$	8	°C/W	_
Junction-to-package top ⁴	$R_{ heta JT}$	2	°C/W	_

Assumes no thermal vias

4.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, in °C can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

 T_A = ambient temperature (°C)

 $R_{\theta JA}$ = package junction-to-ambient thermal resistance (°C/W)

 P_D = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value which provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

⁴ Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

4.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta IA} = R_{\theta IC} + R_{\theta CA}$$

where:

 $R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

 $R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

 $R_{\theta CA}$ = case-to-ambient thermal resistance (°C/W)

 $R_{\theta JC}$ is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

4.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature.

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_I = T_R + (R_{\theta IR} \times P_D)$$

where:

 $R_{\theta IB}$ = junction-to-board thermal resistance (°C/W)

 T_B = board temperature (°C)

 P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

4.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application, or a more accurate and complex model of the package can be used in the thermal simulation.

4.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_{J} = T_{T} + (\Psi_{JT} \times P_{D})$$

where:

 Ψ_{JT} = thermal characterization parameter

 T_T = thermocouple temperature on top of package

 P_D = power dissipation in package

The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the case to avoid measurement errors caused by cooling effects of the thermocouple wire.

4.6 Layout Practices

Each V_{CC} pin should be provided with a low-impedance path to the board's power supply. Each ground pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The V_{CC} power supply should be bypassed to ground using at least four 0.1 μ F bypass capacitors located as close as possible to the four sides of the package. The capacitor leads and associated printed circuit traces connecting to chip V_{CC} and ground should be kept to less than half an inch per capacitor lead. A four-layer board employing two inner layers as V_{CC} and GND planes is recommended.

All output pins on the MPC8272 have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized in order to minimize overdamped conditions and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the $V_{\rm CC}$ and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

5 Power Dissipation

Table 7 provides preliminary, estimated power dissipation for various configurations. Note that suitable thermal management is required to ensure the junction temperature does not exceed the maximum specified value. Also note that the I/O power should be included when determining whether to use a heat sink. For a complete list of possible clock configurations, refer to Section 7, "Clock Configuration Modes."

Table 7. Estimated Power Dissipation for Various Configurations ¹

	СРМ		CPU		P _{INT} (\	W) ^{2, 3}	
Bus (MHz)	Multiplication Factor	CPM (MHz)	Multiplication Factor	CPU (MHz)	Vddl 1.	5 Volts	
	1 40101		1 40101		Nominal	Maximum

100	2	200	3	300	0.85	0.9	
100	2	200	4	400	1	1.05	

Test temperature = 105° C)

6 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for 66.67-/83.33-/100-MHz MPC8272 devices. Note that AC timings are based on a 50-pf load. Typical output buffer impedances are shown in Table 8.

Table 8. Output Buffer Impedances ¹

Output Buffers	Typical Impedance (Ω)
60x bus	45
Memory controller	45
Parallel I/O	45
PCI	25

¹ These are typical values at 65° C. Impedance may vary by ±25% with process and temperature.

6.1 CPM AC Characteristics

Table 9 lists CPM output characteristics.

² $P_{INT} = I_{DD} \times V_{DD}$ Watts

³ Values do not include I/O. Add the following estimates for active I/O based on the following bus speeds: 66.7 MHz = 0.35 W (nominal), 0.4 W (maximum)

^{83.3} MHz = 0.4 W (nominal), 0.5 W (maximum)

¹⁰⁰ MHz = 0.5 W (nominal), 0.6 W (maximum)

Freescale Semiconductor, Inc. AC Electrical Characteristics

Table 9. AC Characteristics for CPM Outputs 1

Spec N	Spec Number Characteristic				Value	e (ns)		
Max	Min		Maximum Delay		Minimum Delay

sp22	sp23	PIO/TIMER/IDMA inputs	10	8	8	0.5	0.5	0.5

¹ Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

AC Electrical Characteristics

Figure 3 shows the FCC internal clock.

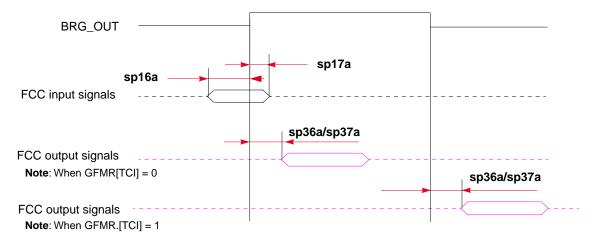

Figure 3. FCC Internal Clock Diagram

Figure 4 shows the FCC external clock.

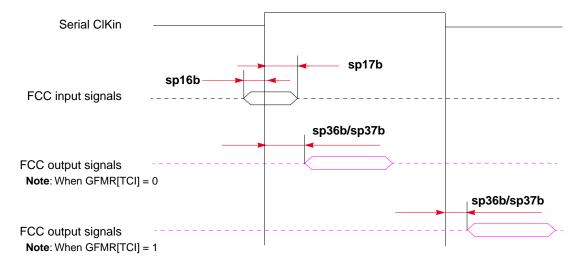

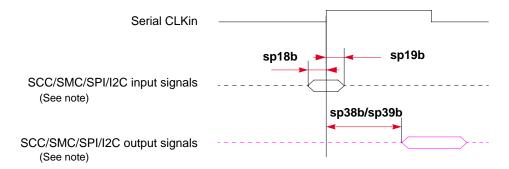

Figure 4. FCC External Clock Diagram

16

AC Electrical Characteristics

Figure 5 shows the SCC/SMC/SPI/I²C external clock.

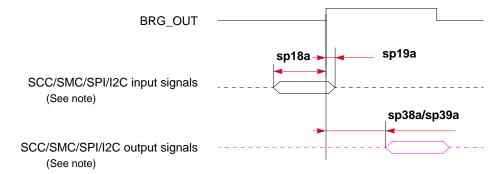

Note: There are four possible timing conditions for SCC and SPI:

- 1. Input sampled on the rising edge and output driven on the rising edge (shown).
- 2. Input sampled on the rising edge and output driven on the falling edge.
- 3. Input sampled on the falling edge and output driven on the falling edge.
- 4. Input sampled on the falling edge and output driven on the rising edge.

Figure 5. SCC/SMC/SPI/I²C External Clock Diagram

Figure 6 shows the SCC/SMC/SPI/I²C internal clock.

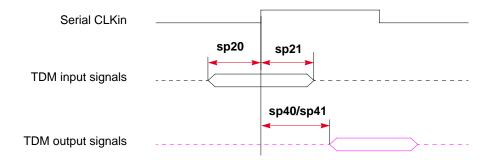

Note: There are four possible timing conditions for SCC and SPI:

- 1. Input sampled on the rising edge and output driven on the rising edge (shown).
- 2. Input sampled on the rising edge and output driven on the falling edge.
- 3. Input sampled on the falling edge and output driven on the falling edge.
- 4. Input sampled on the falling edge and output driven on the rising edge.

Figure 6. SCC/SMC/SPI/I²C Internal Clock Diagram

AC Electrical Characteristics

Figure 7 shows TDM input and output signals.

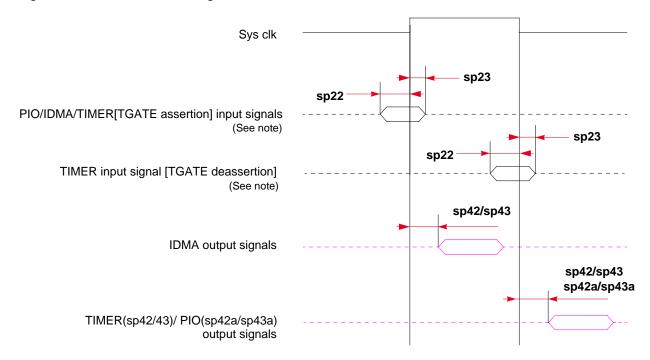

Note: There are four possible TDM timing conditions:

- 1. Input sampled on the rising edge and output driven on the rising edge (shown).
- 2. Input sampled on the rising edge and output driven on the falling edge.
- 3. Input sampled on the falling edge and output driven on the falling edge.
- 4. Input sampled on the falling edge and output driven on the rising edge.

Figure 7. TDM Signal Diagram

Figure 8 shows PIO and timer signals.

Note: TGATE is asserted on the rising edge of the clock; it is deasserted on the falling edge.

Figure 8. PIO and Timer Signal Diagram

6.2 SIU AC Characteristics

Table 11 lists SIU input characteristics.

NOTE: PCI AC Timing

The MPC8272 meets the timing requirements of *PCI Specification Revision 2.2*. Refer to Section 7, "Clock Configuration Modes" and "Note: Tval (Output Hold)" to determine if a specific clock configuration is compliant.

Table 11. AC Characteristics for SIU Inputs ¹

Spec N	lumber	Characteristic			Value	e (ns)		
Setup	Hold			Setup			Hold	
			66 MHz	83 MHz	100 MHz	66 MHz	83 MHz	100 MHz
sp11	sp10	AACK/TA/TS/DBG/BG/BR	6	5	3.5	0.5	0.5	0.5
sp11a	sp10	ARTRY/ TEA	6	5	4	0.5	0.5	0.5
sp12	sp10	Data bus in normal mode	5	4	3.5	0.5	0.5	0.5
sp13	sp10	Data bus in pipeline mode	5	4	2.5	0.5	0.5	0.5
sp15	sp10	All other pins	5	4	3.5	0.5	0.5	0.5

Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

Table 12 lists SIU output characteristics.

Table 12. AC Characteristics for SIU Outputs ¹

Spec N	lumber	Characteristic			Value	e (ns)		
Max	Min		Max	cimum D	elay	Min	imum De	elay
			66 MHz	83 MHz	100 MHz	66 MHz	83 MHz	100 MHz
sp31	sp30	PSDVAL/TEA/TA	7	6	5.5	1	1	1
sp32	sp30	ADD/ADD_atr./BADDR/CI/GBL/WT	8	6.5	5.5	1	1	1
sp33	sp30	Data bus ²	6.5	6.5	5.5	0.5	0.5	0.5
sp34	sp30	Memory controller signals/ALE	6	5.5	5.5	1	1	1
sp35	sp30	All other signals	6	5.5	5.5	1	1	1

Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

NOTE

Activating data pipelining (setting BRx[DR] in the memory controller) improves the AC timing.

Figure 9 shows the interaction of several bus signals.

Go to: www.freescale.com

 $^{^2}$ To achieve 1 ns of hold time at 66.67/83.33/100 MHZ, a minimum loading of 20 pF is required.

AC Electrical Characteristics

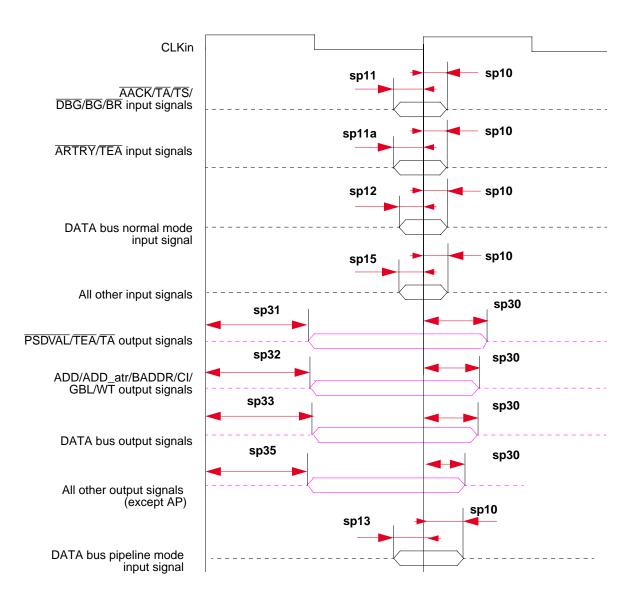

Figure 9. Bus Signals

Figure 10 shows signal behavior in MEMC mode.

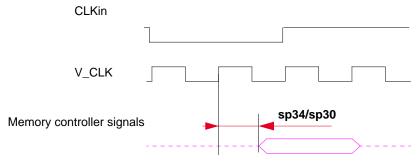

Figure 10. MEMC Mode Diagram

AC Electrical Characteristics

NOTE

Generally, all MPC8272 bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 13.

Table 13. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin							
FLE GIOCK NATIO	T2	Т3	T4					
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin					
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin					
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin					

Figure 11 is a representation of the information in Table 13.

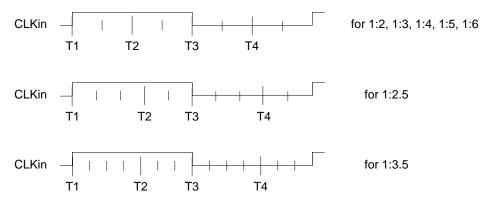

Figure 11. Internal Tick Spacing for Memory Controller Signals

NOTE

The UPM machine outputs change on the internal tick determined by the memory controller programming; the AC specifications are relative to the internal tick. Note that SDRAM and GPCM machine outputs change on CLKin's rising edge.

7 Clock Configuration Modes

As shown in Table 14, the clocking mode is set according to two sources:

- PCI_CFG[0]— An input signal. Also defined as "PCI_HOST_EN." Refer to the Chapter 6, "External Signals," and Chapter 9, "PCI Bridge," in the MPC8272 PowerQUICC IITM Family Reference Manual.
- PCI_MODCK—Bit 27 in the Hard Reset Configuration Word. Refer to Chapter 5, "Reset," in the MPC8272 PowerQUICC IITM Family Reference Manual.

Table 14. MPC8272 Clocking Modes

Pi	ns	Clocking Mode	PCI Clock Frequency	Reference
PCI_CFG[0] ¹	PCI_MODCK ²	Clocking mode	Range (MHZ)	Kelerence
0	0	PCI host	50–66	Table 15
0	1		25–50	Table 16
1	0	PCI agent	50–66	Table 17
1	1		25–50	Table 18

PCI_HOST_EN

Within each mode, the configuration of bus, core, PCI, and CPM frequencies is determined by seven bits during the power-on reset—three hardware configuration pins (MODCK[1–3]) and four bits from hardware configuration word[28–31] (MODCK_H). Both the PLLs and the dividers are set according to the selected clock operation mode as described in the following sections.

NOTE

Clock configurations change only after PORESET is asserted.

NOTE: Tval (Output Hold)

The minimum Tval = 2 when PCI_MODCK = 1, and the minimum Tval = 1 when PCI_MODCK = 0. Therefore, designers should use clock configurations that fit this condition to achieve PCI-compliant AC timing.

7.1 PCI Host Mode

Table 15 and Table 16 show configurations for PCI host mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI host mode the input clock is the bus clock.

² Determines PCI clock frequency range.

Table 15. Clock Configurations for PCI Host Mode (PCI_MODCK=0) 1,2

The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency guarantees the required minimum CPU operating frequency. Minimum CPU frequency is determined by the clock mode. For modes with a CPU multiplication factor ≤ 3, the minimum CPU frequency is 125 MHz or 150 MHz, as shown in the table. For modes with a CPU multiplication factor ≥ 3.5, the minimum CPU frequency is 250 MHz. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device.

² PCI_MODCK determines the PCI clock frequency range. Refer to Table 16 for lower range configurations.

MODCK_H = hard reset configuration word [28–31] (refer to Section 5.4 in the MPC8260 User's Manual). MODCK[1-3] = three hardware configuration pins.

⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency guarantees the required minimum CPU operating frequency. Minimum CPU frequency is determined by the clock mode. For modes with a CPU multiplication factor ≤ 3, the minimum CPU frequency is 125 MHz or 150 MHz, as shown in the table. For modes with a CPU multiplication factor ≥ 3.5, the minimum CPU frequency is 250 MHz. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device.

7.2 PCI Agent Mode

Table 17 and Table 18 show configurations for PCI agent mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI agent mode the input clock is PCI clock.

² PCI MODCK determines the PCI clock frequency range. Refer to Table 15 for higher range configurations.

MODCK_H = hard reset configuration word [28–31] (refer to Section 5.4 in the MPC8260 User's Manual). MODCK[1-3] = three hardware configuration pins.

⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency guarantees the required minimum CPU operating frequency. Minimum CPU frequency is determined by the clock mode. For modes with a CPU multiplication factor ≤ 3, the minimum CPU frequency is 125 MHz or 150 MHz, as shown in the table. For modes with a CPU multiplication factor ≥ 3.5, the minimum CPU frequency is 250 MHz. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device.

- ² PCI_MODCK determines the PCI clock frequency range. Refer to Table 18 for lower range configurations.
- MODCK_H = hard reset configuration word [28–31] (refer to Section 5.4 in the MPC8260 User's Manual). MODCK[1-3] = three hardware configuration pins.
- ⁴ CPM multiplication factor = CPM clock/bus clock
- ⁵ CPU multiplication factor = Core PLL multiplication factor

Clock Configuration Modes

Table 18. Clock Configurations for PCI Agent Mode (PCI_MODCK=1) 1, 2 (continued)

Mode ³		Clock Hz)	CPM Multiplication	_	Clock Hz)	CPU Multiplication		Clock Hz)	Bus Division		Clock Hz)
MODCK_H- MODCK[1-3]	Low	High	Factor ⁴	Low	High	Factor ⁵	Low	High	Factor	Low	High
1100_000		Reserved									
1100_001		Reserved									
1100_010		Reserved									

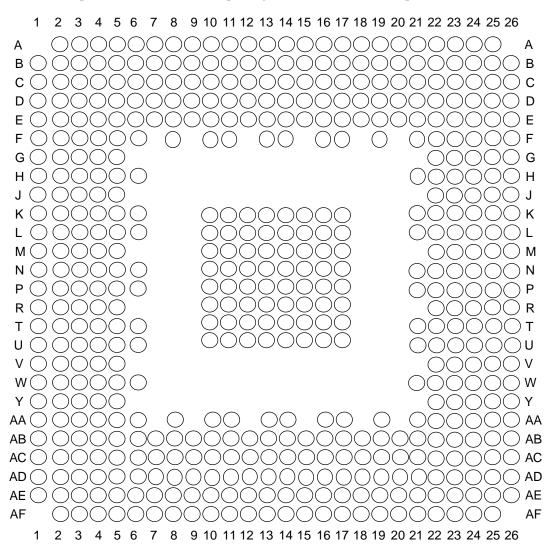

The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency guarantees the required minimum CPU operating frequency. Minimum CPU frequency is determined by the clock mode. For modes with a CPU multiplication factor ≤ 3, the minimum CPU frequency is 125 MHz or 150 MHz, as shown in the table. For modes with a CPU multiplication factor ≥ 3.5, the minimum CPU frequency is 250 MHz. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device.

- ² PCI_MODCK determines the PCI clock frequency range. Refer to Table 17 for higher range configurations.
- MODCK_H = hard reset configuration word [28–31] (refer to Section 5.4 in the MPC8260 User's Manual). MODCK[1-3] = three hardware configuration pins.
- ⁴ CPM multiplication factor = CPM clock/bus clock
- ⁵ CPU multiplication factor = Core PLL multiplication factor

8 Pinout

The figure and table below show the pin assignments and pinout for the 516 PBGA package.

Figure 12 shows the pinout of the 516 PBGA package as viewed from the top surface.

Not to Scale

Figure 12. Pinout of the 516 PBGA Package (View from Top)

Must be tied to ground.

 $^{^2~}$ Should be tied to VDDH via a 2K Ω external pull-up resistor.

The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

⁴ This pin is not connected. It should be left floating.

⁵ Must be pulled down or left floating

9 Package

Figure 13 shows the side profile of the PBGA package.

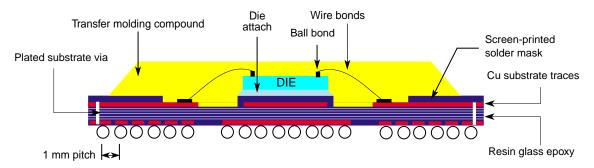

Figure 13. Side View of the PBGA Package Remove

Table 20 provides package parameters. Figure 14 provides the mechanical dimensions and bottom surface nomenclature of the 516 PBGA package.

Table 20. Package Parameters

Code	Туре	Outline (mm)	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
VR, ZQ	PBGA	27 x 27	516	1	2.25

NOTE: Temperature Reflow for the VR Package

In the VR package, sphere composition is lead-free (refer to Table 2). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Users should consult "Motorola PowerQUICC IITM Pb-Free Packaging Information" (MPC8250PBFREEPKG) available at www.motorola.com/semiconductors.

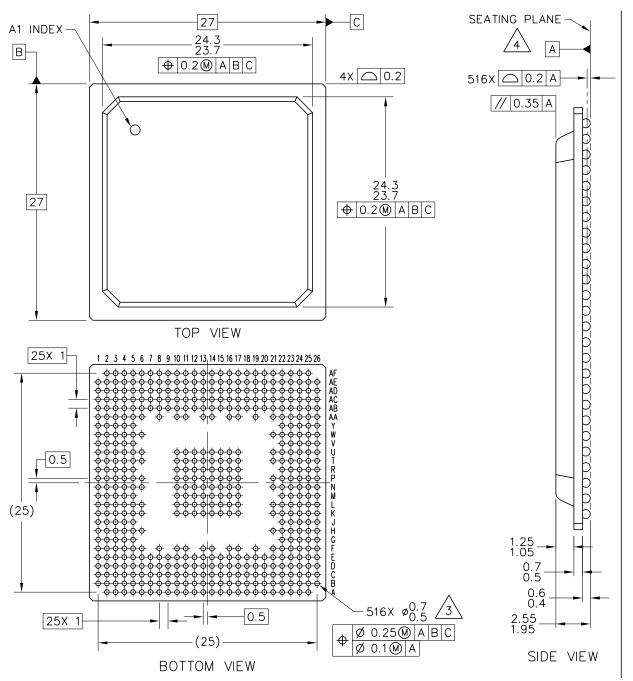

Figure 14. Mechanical Dimensions and Bottom Surface Nomenclature—516 PBGA

10 Ordering Information

Figure 15 provides an example of the Motorola part numbering nomenclature for the MPC8272. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact a local Motorola sales office.

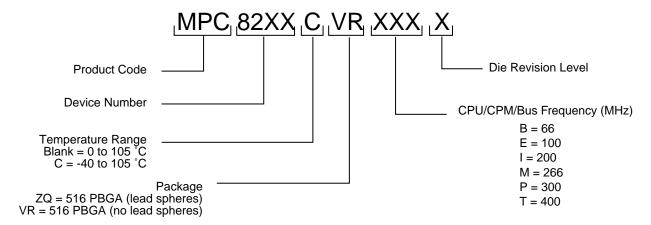

Figure 15. Motorola Part Number Key

11 Document Revision History

Table 21 lists significant changes between revisions of this hardware specification.

Table 21. Document Revision History

Revision	Date	Substantive Changes
0	5/2003	NDA release

Document Revision History

Table 21. Document Revision History

Revision	Date	Substantive Changes
0.1	9/2003	 Addition of the MPC8271 and the MPC8247 (these devices do not have a security engine) Table 5: Addition of note 2 to V_{IH} Table 5: Changed I_{OL} for 60x signals to 6.0 mA Modification of note 1 for Table 15, Table 16, Table 17, and Table 18 Table 19: Addition of ball AD9 to GND. In rev 0 of this document, AD8 was listed as assigned to both CS5 and GND. AD8 is only assigned to CS5. Table 19: Addition of note 4 to Thermal0 (D19) and Thermal1(J3) Addition of ZQ package code to Figure 15
0.2	12/2003	 Table 1: New Table 2: New Table 4: Modification of VDD and VCCSYN to 1.45–1.60 V Table 5: Addition of note 2 regarding TRST and PORESET (see V_{IH} row of Table 5) Table 5 and Table 19: Addition of muxed signals CPCI_HS_LED to PCI_GNT1 (AE13) CPCI_HS_ENUM to PCI_GNT2 (AF21) CPCI_HS_ENUM to PCI_GNT3 (AE21) Table 5 and Table 19: Modification of PCI signal names for consistency with PCI signal names on other PowerQUICC II devices: PCI_CFG0 (PCI_HOST_EN) (AC21) PCI_CFG1 (PCI_ARB_EN) (AE22) PCI_CFG2 (DLL_ENABLE) (AE23) PCI_TRDY (AF16) PCI_IRDY (AF16) PCI_IRDY (AF16) PCI_IRDY (AF16) PCI_STOP (AE15) DEVSEL (AE14) PCI_DESE (AC17) PCI_SERR (AD13) PCI_SERR (AD14) PCI_SERR (AD14) PCI_SERR (AD15) PCI_STOP (AE22) PCI_INTA (AE21) PCI_GNT0-2 (AD20, AE13, AF21) PCI_GNT0-2 (AD20, AE13, AF21) PCI_CO3 (AE12, AF13, AC15, AE18) PCI_AD0-31 Table 5 and Table 19: Corrected assertion level (added """) PCI_HOST_EN (AC21) and PCI_ARB_EN (AE22) PCI_ARB_EN (AE22) Table 6: Addition of R_{0JT} and note 4 Sections 4.1-4.5 and 4.7 on thermal characteristics: New Sections 4.1-4.5 and 4.7 on thermal characteristics: New Sections 4.1-4.5 and 4.7 on thermal characteristics in the MPC8280 Family. Addition of "Note: Temperature Reflow for the VR Package" on page 51 Table 19: Addition of note 2 to TRST (E21) and PORESET (C24) Table 19: Removal of Thermallo (D19) and Thermal1(J3). These pins are now "No connects." Note 4 unchanged. Table 19: Removal of Spare0 (AD24). This pin is now a "No connect." Note 5 unchanged. Table 19: Addition of PCI_MODE (AD22). This pin was previously listed as "Ground." Addition of note 1.
