## Features

- **5 Smart Card Interfaces**
  - Compliance with ISO 7816, EMV2000, GIE-CB and GSM Standards
  - Direct Connection to the Smart Cards
    - Logic Level Shifters
    - Short Circuit Current Limitation
    - 4kV+ ESD Protection (MIL/STD 883 Class 3)
  - 1 or 2 Master Smart Card Interfaces
    - Synchronous Card support (with C4 and C8 Contacts)
    - Card Detection and Automatic de-activation sequence on card extraction
  - 1 to 4 SAM/SIM cards (15 to 30mA each)
  - Programmable Voltage for each smart card
    - Class A: 5V  $\pm$ 0.4V at 60 mA ( $\pm$ 0.25V at 65 mA with VCC= 5V $\pm$ 10%)
    - Class B: 3V  $\pm$ 0.2V at 60 mA
    - Class C: 1.8V  $\pm$ 0.14V at 40mA
  - Low Ripple Noise: < 200 mV
  - Programmable Activation Sequence
  - Automatic de-activation on card power-fail or over-current and system power-fail
  - Card Clock Stop High or Low for Card Power-down Modes
- **Versatile Host Interface**
  - Two Wire Interface (TWI) Link at 400kbit/s
    - Programmable Address allow up to 4 AT83C26 on the bus
  - Programmable Interrupt Output
- **Reset Output Includes**
  - Power-On Reset (POR)
  - Power-Fail Detector (PFD)
- **Extended Voltage Operation: 3 to 5.5V**
- **Low Power Consumption**
  - 5 mA Maximum Operating Current (without Smart Card)
  - 150 mA Maximum In-rush Current (each DC/DC)
  - 30  $\mu$ A Typical Power-down Current (without Smart Card)
- **4 to 48 MHz Clock Input**
- **System clock derived from the external clock input**
- **Industrial Temperature Range: -40 to +85°C**
- **Packages: QFN48, VQFP48**

## Description

The AT83C26 is a smart card reader interface IC for smart card reader/writer applications such as EFT/POS terminals and set top boxes. It enables the management of any type of smart card from any kind of host. Up to 4 AT83C26 can be connected in parallel thanks to the programmable TWI address.

Its high efficiency DC/DC converters and low quiescent current in stand-by mode make it particularly suited to low power and portable applications. The reduced bill of material allows to lower significantly the system size and cost. A sophisticated protection system guarantees timely and controlled shutdown upon error conditions.

## Signals

**Table 1. Ports Description**

VQFP48 or QFN48 Pin number	Pad Name	Pad Internal Power Supply	ESD Limits	Pad Type	Description
1	CVCC3		4kV+	PWR	VCC pin for SC3 interface.
2	CRST3/CC82	CVCC3	4kV+	I/O pull up	See SC2_CFG1 register: If SC2_FULL bit = 0, CRST pin for SC3 interface. If SC2_FULL bit = 1, CC8 pin for SC2 interface.
3	CCLK3	CVCC3	4kV+	O	CCLK pin for SC3 interface.
4	CIO3/CC42	CVCC3	4kV+	I/O pull up	See SC2_CFG1 register: If SC2_FULL bit = 0, CIO pin for SC3 interface. If SC2_FULL bit = 1, CC4 pin for SC2 interface.
5	CVCC4		4kV+	PWR	VCC pin for SC4 interface.
6	CRST4	CVCC4	4kV+	O	RST pin for SC4 interface.
7	CCLK4	CVCC4	4kV+	O	CCLK pin for SC4 interface.
8	CIO4	CVCC4	4kV+	I/O pull up	CIO pin for SC4 interface.
9	CIO5	CVCC5	4kV+	I/O pull up	CIO pin for SC5 interface.
10	CCLK5	CVCC5	4kV+	O	CCLK pin for SC5 interface.
11	CRST5	CVCC5	4kV+	O	RST pin for SC5 interface.
12	CVCC5		4kV+	PWR	VCC pin for SC5 interface.
13	CC81	CVCC1	4kV+	I/O pull up	CC8 pin for SC1 interface.
14	CC41	CVCC1	4kV+	I/O pull up	CC4 pin for SC1 interface.
15	CIO1	CVCC1	4kV+	I/O pull up	CIO pin for SC1 interface.
16	CCLK1	CVCC1	4kV+	O	CCLK pin for SC1 interface.
17	CRST1	CVCC1	4kV+	O	RST pin for SC1 interface.
18	CVCCIN1		4kV+	PWR	This pin must be connected to CVCC1 pins next to the package.
19	CPRES1	VCC	4kV+	I pull up	Card presence for SC1 interface. An internal pull up to VCC can be activated in the pad if necessary using PULLUP1 bit in SC1_CFG1 register (activated by default).
20	CVCC1		4kV+	PWR	VCC pin for SC1 interface. The two CVCC1 pins are connected together near the package. Only one wire goes to the smart card connector. The reason of two CVCC1 pins is to reduce noise.
21	CVCC1		4kV+	PWR	VCC pin for SC1 interface.

**Table 1. Ports Description (Continued)**

VQFP48 or QFN48 Pin number	Pad Name	Pad Internal Power Supply	ESD Limits	Pad Type	Description
22	LIA		2kV	PWR	DC/DCA input. LIA must be tied to VCC pin through an external coil (typically 10µH) and provides the current for the charge pump of the DC/DCA converter. It may be directly connected to VCC if the step-up converter is not used (see STEPREGA bit in SC1_CFG4 register and see minimum VCC values in Table 50.for class A and Table 51. for class B)
23	CVSS1		2kV	GND	DC/DCA input. This pin must be directly connected to the VSS of power supply.
24	VCC		2kV	PWR	VCC is used to power the internal voltage regulators and I/O buffers.
25	VSS		2kV	GND	Ground.
26	BYPASS	VCC	2kV	I	A high level on this pin activates a low power consumption mode with internal regulator bypassed.
27	SDA	VCC	2kV	I/O open drain	Micro controller interface function: TWI serial data. An external pull up must be connected on SDA pin (4.7kOhms).
28	SCL	VCC	2kV	I/O open drain	Micro controller interface function: TWI clock. An external pull up must be connected on SCL pin (4.7kOhms).
29	IO2	EVCC	2kV	I/O pull up	The behavior of this pin depends on IOSEL[3:0] bits values (see IO_SELECT register).
30	IO1	EVCC	2kV	I/O pull up	The behavior of this pin depends on IOSEL[3:0] bits values (see IO_SELECT register).
31	AUX2	EVCC	2kV	I/O pull up	The behavior of this pin depends on IOSEL[3:0] bits values (see IO_SELECT register).
32	AUX1	EVCC	2kV	I/O pull up	The behavior of this pin depends on IOSEL[3:0] bits values (see IO_SELECT register).
33	A1/RST	EVCC	2kV	I	The TWI address depends on the value present on this pin at reset. If CRST transparent mode is selected, the A1/RST signal is connected to CRST1 or CRST2 pins (see CRST_SEL1 and CRST_SEL2 bits respectively in SC1_CFG4 and SC2_CFG2 registers).
34	A2/CK	EVCC	2kV	I	The TWI address depends on the value present on this pin at reset. If CCLKn transparent mode is selected, the A2/CK signal is connected to CCLKn pins (with n=1 to 5). See CKSn[2:0] bits respectively in SC1_CFG1, SC2_CFG2, SC3_CFG2, SC4_CFG2, SC5_CFG2 registers.
35	CLK	EVCC	2kV	I	Master clock.
36	$\overline{\text{INT}}$	VCC	2kV	O open drain	Interruption status. An internal pull up to VCC can be activated in the pin if necessary using INT_PULLUP bit in SC1_CFG4 (deactivated by default).
37	EVCC			PWR	Extra supply voltage (Micro controller power supply). EVCC is used to supply the internal level shifters of host interface pins. EVCC is connected to the host power supply. EVCC voltage can be directly connected to VCC if the host power supply and the AT83C26 power supply is the same.

**Table 1. Ports Description (Continued)**

VQFP48 or QFN48 Pin number	Pad Name	Pad Internal Power Supply	ESD Limits	Pad Type	Description
38	CVSSB			GND	DC/DCB input. This pin must be directly connected to the VSS of power supply.
39	LIB		2kV	PWR	DC/DCB input. LIB must be tied to VCC pin through an external coil (typically 10µH) and provides the current for the charge pump of the DC/DCB converter. It may be directly connected to VCC if the step-up converter is not used (see STEPREG bit in DCDCB register and see minimum VCC values in Table 53. for class A and Table 54. for class B)
40	CVCCB		2kV	PWR	DC/DCB output. The two CVCCB pins are connected together near the package. CVCCB pin is only used for DC/DCB voltage measurements. The reason of two CVCCB pins is to reduce noise.
41	CVCCB		2kV	PWR	DC/DCB output.
42	$\overline{\text{RESET}}$	VCC	2kV	I/O open drain	Micro controller interface function: reset signal. <ul style="list-style-type: none"> <li>power on reset</li> <li>A low level on this pin keeps the AT83C26 under reset even if applied on power-on. It also resets the AT83C26 if applied when the AT83C26 is running.</li> <li>Asserting <math>\overline{\text{RESET}}</math></li> </ul>
43	CPRES2	VCC	4kV+	I pull up	Card presence for SC2 interface. An internal pull to VCC can be activated in the pad if necessary using PULLUP2 bit in SC2_CFG1 register (activated by default).
44	CVCCINB			PWR	This pin must be connected to CVCCB pins next to the package.
45	CVCC2		4kV+	PWR	VCC pin for SC2 interface.
46	CRST2	CVCC2	4kV+	O	CRST pin for SC2 interface.
47	CCLK2	CVCC2	4kV+	O	CCLK pin for SC2 interface.
48	CIO2	CVCC2	4kV+	I/O pull up	CIO pin for SC2 interface.

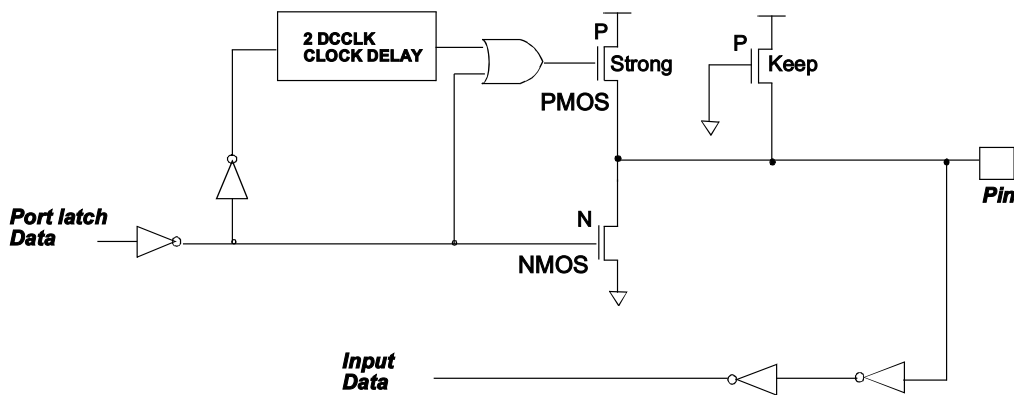

### Pad Type Description

To simplify the understanding of Figure 1. to Figure 8., a shortcut is possible by replacing the weak transistor by a 100k Ohms pull-up resistor, the medium transistor by a 10k Ohms pull-up resistor and the strong transistor by a 1k Ohms pull-up resistor.

### Input/Output with Pull-up Configuration (IO1, IO2, AUX1, AUX2)

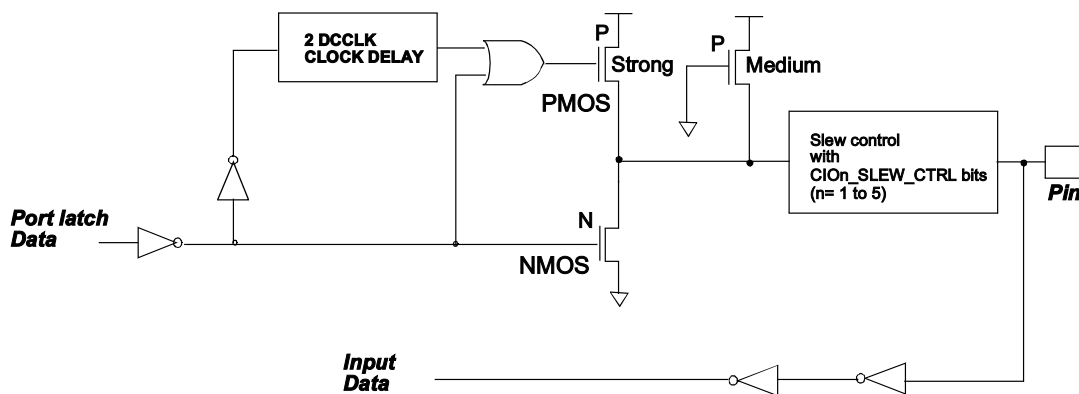

This output type can be used as both an input and output without the need to reconfigure the port. This is possible because when the port outputs a logic high, it is weakly driven, allowing an external device to pull the pin low. When the port outputs a logic low state, it is driven strongly and able to sink a fairly large current.

Figure 1. Input/Output with Pull-up Configuration

### Input/Output with Pull-up Configuration (CIO<sub>n</sub> with n = 1, 2, 3, 4, 5) and (CC4<sub>n</sub>, CC8<sub>n</sub> with n = 1, 2)

## Operational Modes

### TWI Bus Control

The Atmel Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 Kbits per second, based on a byte-oriented transfer format.

The TWI-bus interface can be used:

- To configure the AT83C26
- To select interface
- To select the operating mode of the card: 1.8V, 3V or 5V
- To configure the automatic activation sequence
- To start or stop sessions (activation and de-activation sequences)
- To initiate a warm reset
- To control the clock to the card in active mode
- To control the clock to the card in stand-by mode (stop LOW, stop HIGH or running)
- To enter or leave the card stand-by or power-down modes
- To select the interface (connection to the host I/O/C4/C8)
- To request the status (card present or not, over-current and out of range supply voltage occurrence)
- To drive and monitor the card contacts by software
- To accurately measure the ATR delay when automatic activation is used
- Re-use the AT83C24 command set for the first DC/DC and smart card interface with the following changes:
  - CKS extended to CONFIG2[0:3], CKS=8 selects CLK/3 and CKS>8 is reserved
  - The slave address byte for TWI write commands is 0100 A<sub>2</sub>A<sub>1</sub>10 and 0100 A<sub>2</sub>A<sub>1</sub>11 for TWI read commands

## TWI Commands

### Frame Structure

The structure of the TWI bus data frames is made of one or a series of write and read commands completed by STOP.

Write commands to the AT83C26 have the structure:

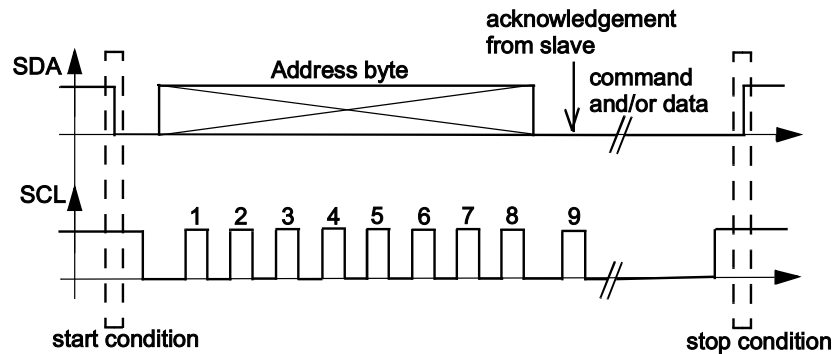

ADDRESS BYTE + COMMAND BYTE + DATA BYTE(S)

Read commands to the AT83C26 have the structure:

ADDRESS BYTE + DATA BYTE(S)

The ADDRESS BYTE is sampled on A2/CK and A1/RST **after each reset** (hard/soft/general call) but A2/CK, A1/RST can be used for transparent mode after the reset.

Figure 1. Data transfer on TWI bus

**Address Byte**

The first byte to send to the device is the address byte. The device controls if the hardware address (A2/CK, A1/RST pins on reset) corresponds to the address given in the address byte (A2, A1 bits).

If the level is not stable on A2/CK pin at reset, the user has to manage the possible address taken by the device.

Figure 2. Address Byte

Up to 4 devices can be connected on the same TWI bus. Each device is configured with a different combination on A2/CK, A1/RST pins. The address byte of each device for read/write operations are listed below.

Table 2. Address Byte Values

A2 (A2/CK pin)	A1 (A1/RST pin)	Address Byte for Read Command	Address Byte for Write Command
0	0	0x43	0x42
0	1	0x47	0x46
1	0	0x4B	0x4A
1	1	0x4F	0x4E

## RESET pin

The TWI ADDRESS BYTE is sampled on A2/CK and A1/RST after a rising edge on  $\overline{\text{RESET}}$  pin. The delay between the rising edge and the sampling of A2/CK and A1/RST is  $t_1$ .

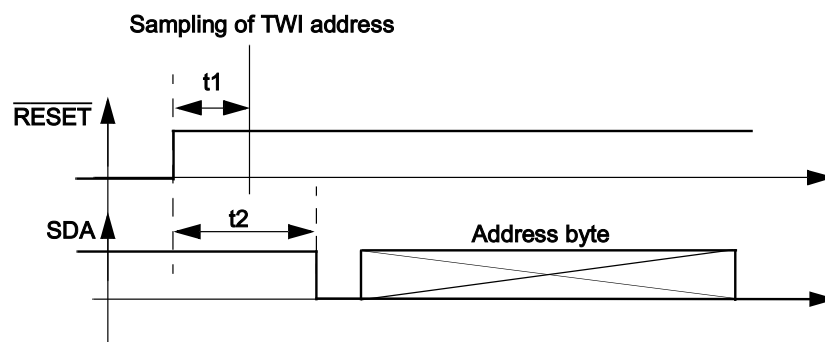

The value for  $t_1$  is 22 CLK period.

The minimum value for  $t_2$  is 40 CLK period. During the  $t_2$  time, the TWI bus is not ready to receive a command.

The CLK period depends on the frequency of the signal on CLK pin.

The  $\overline{\text{RESET}}$  pin is an I/O with Open Drain. The host IO pin connected to  $\overline{\text{RESET}}$  must be an I/O with open drain (with external pull-up) or an I/O with internal pull up (without external pull-up).

**Figure 3.** Timings after reset

## BYPASS pin

A high level on this pin activates a low power consumption mode.

At reset, the level on this pin must be fixed (VSS or VCC).

Before to set BYPASS pin, SHUTDOWNNA and SHUTDOWNNB bits must be set.

If SHUTDOWNNA bit is set, DCDCA is switched off.

If SHUTDOWNNB bit is set, DCDCB is switched off.

If SHUTDOWNNA and SHUTDOWNNB bits are set, the regulator is switched off.

If BYPASS pin is at a high level, the bandgaps are switched off.

## Smart Card Interfaces

The AT83C26 enables the management of up to 5 smart card interfaces. Due to shared IOs between SC2 and SC3, the user should choose between a full SC2 interface (with CC4 and CC8) or SC3 interface.

The SC2\_FULL bit in SC2\_CFG1 register is used to select the SC2/SC3 interfaces configuration.

**Table 3. SC2 and SC3 shared IOs**

Pin name	SC2_FULL = 1 SC3 interface not available	SC2_FULL = 0 SC2 without CC4 and CC8 + SC3 interface
CPRES2	CPRES2	CPRES2
CRST2	CRST2	CRST2
CIO2	CIO2	CIO2
CCLK2	CCLK2	CCLK2
CRST3/CC82	CC82	CRST3
CIO3/CC42	CC42	CIO3
CCLK3	unused	CCLK3

## DCDC Converters

The DC/DC A converter is used to provide smart card voltage for the SC1 interface (CVCC1).

The DC/DC B converter is used to provide smart card voltage for the SCn interfaces (n=2, 3, 4, 5).

DC/DC converters need a clock of 4MHz (see Section "Clock Controller"). Two internal oscillators (one for each converter) provide the DC/DC clocks.

The DC/DCB output is connected on 4 LDO regulators (Low Drop Output) to generate CVCCn voltage (n=2, 3, 4, 5).

## Clock Controller

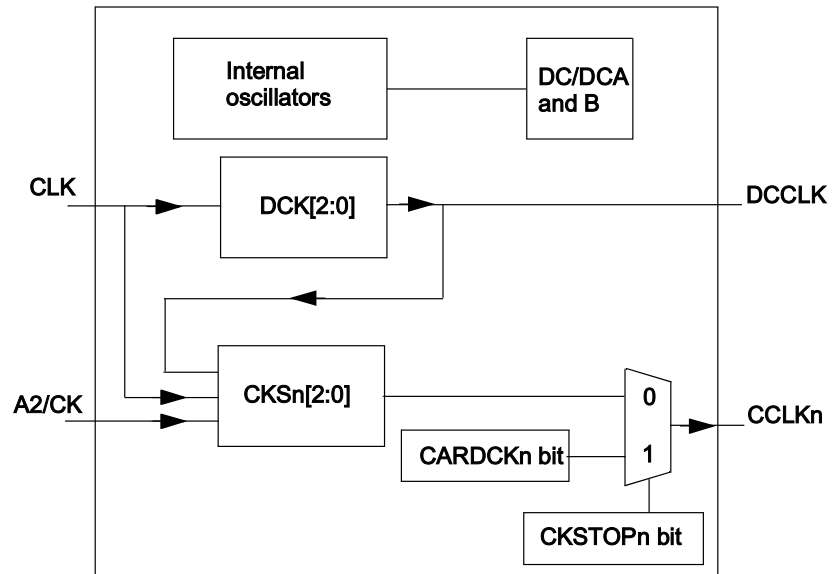

The clock controller outputs six clocks:

1. Five clocks for CCLK1, CCLK2, CCLK3, CCLK4 and CCLK5. Four different sources can be used: CLK pin, DCCLK signal, CARDCKn bit (n=1, 2, 3, 4, 5) or A2/CK.
2. A DCCLK clock used for pads and deactivation sequence.

### Clock controller for SCn (n=1, 2, 3, 4, 5)

The transparent mode with A2/CK pin is available on SCn interface. The CKSn[2:0] register is used to select this transparent mode between A2/CK and CCLKn. The bit CKSTOPn must be cleared to have CCLKn running according to CKSn[2:0].

**Figure 4.** Clock Block Diagram with Software Activation

## CRST controller

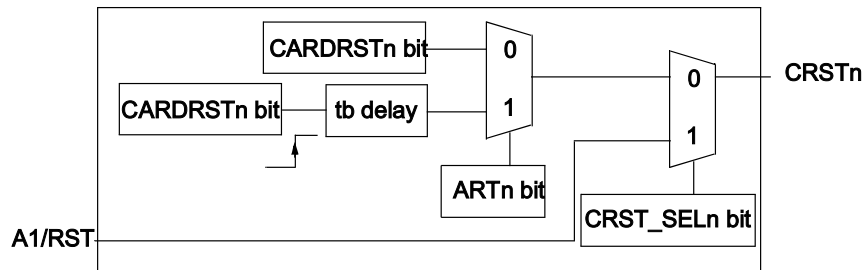

### CRSTn for SCn interface (n=1, 2)

The CRSTn output pin is driven by the CARDRSTn bit value or by A1/RST pin.

Three modes are available:

- If the ARTn bit is reset, CRSTn pin is driven by CARDRSTn bit.
- If the ARTn bit is set, CRSTn pin is controlled and follows the “Automatic Reset Transition” (see Activation sequence page 25).
- A transparent mode with A1/RST pin.

**Figure 5.** CRSTn Block Diagram

**CRSTn for SCn interface (n= 3, 4, 5)**

The CRSTn output pin is driven by the CARDRSTn bit value (see SCn\_CFG2 register).

Two modes are available:

- If the ARTn bit is reset, CRSTn pin is driven by CARDRSTn bit.
- If the ARTn bit is set, CRSTn pin is controlled and follows the “Automatic Reset Transition” (see Activation sequence page 25).

**Figure 6. CRSTn Block Diagram**

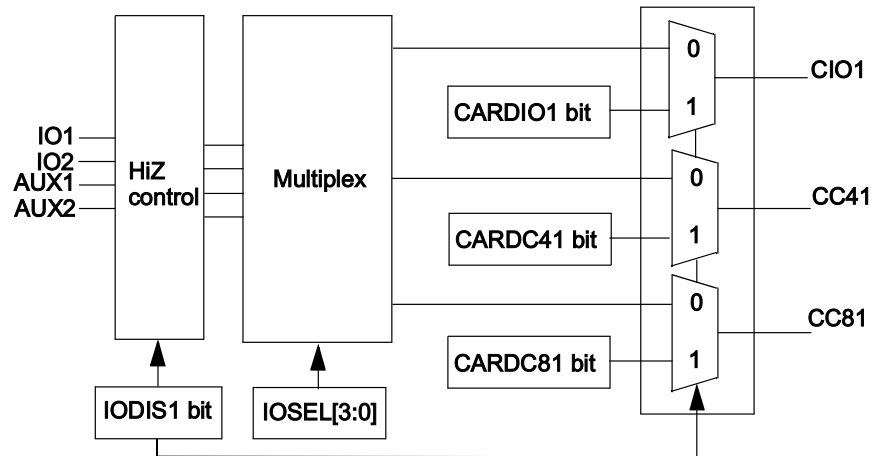

If SC2\_FULL=1, the SC3 interface is not available.

**CIO, CC4, CC8 controller**

**CIO1, CC41, CC81 controller for SC1 interface**

The CIO1, CC41, CC81 output pins are driven respectively by CARDIO1, CARDC41, CARDC81 bits values or by I/O1, I/O2, AUX1 or AUX2 signals. This selection depends of the IODIS1 bit value (SC1\_INTERFACE register) and of IOSEL[3:0] bits value (IO\_SELECT register).

**Figure 7. CIO1, CC41, CC81 Block Diagram**

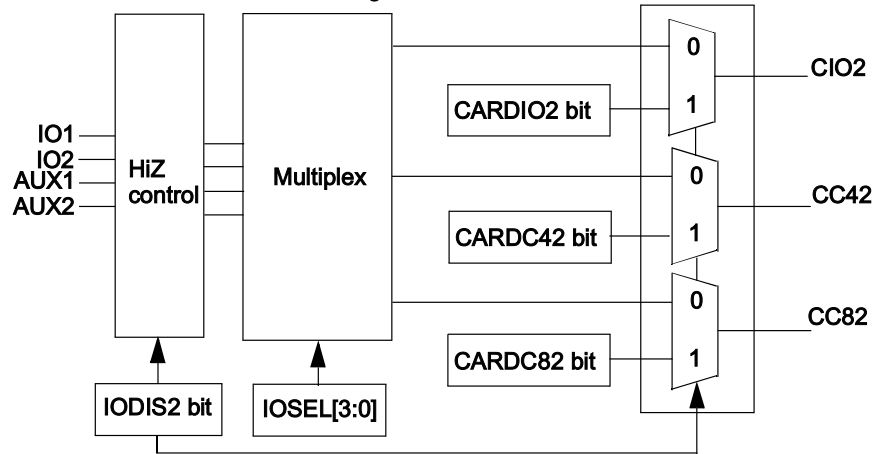

If IODIS1 is set, the CARDIO1 bit value is output on CIO1. The input selected by IOSEL for CIO1 is in High impedance state. CC41 and CC81 have the same behavior.

If IODIS1 is reset, data are bidirectional between the I/O1, I/O2, AUX1, AUX2 pins (see IO\_SELECT register) and CIO1, CC41, CC81 pins.

**CIO2, CC42, CC82 controller for SC2 interface**

**Figure 8. CIO2, CC42, CC82 Block Diagram**

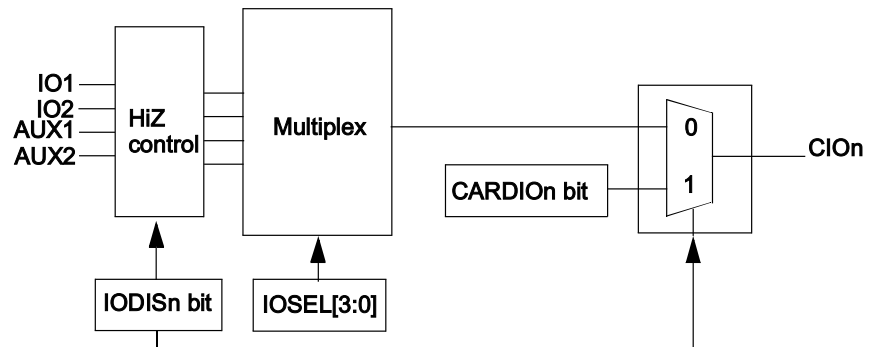

The SC2\_FULL bit must be set to use CC42 and CC82.

**CIO<sub>n</sub> controller for SC<sub>n</sub> interface (n=3, 4, 5)**

The CIO<sub>n</sub> output pin is driven by CARDIO<sub>n</sub> bit values or by I/O1, I/O2, AUX1 or AUX2 signals. This selection depends of the IODIS<sub>n</sub> bit value. If IODIS<sub>n</sub> is reset, data are bidirectional between the I/O1, I/O2, AUX1, AUX2 pins (see IO\_SELECT register) and CIO<sub>n</sub> pins.

**Figure 9. CIO<sub>n</sub> Block Diagram**

**CIO<sub>n</sub> (n=1 to 5), CC41, CC81, CC42, CC82 transparent mode description**

Two modes are available on CIO<sub>n</sub>, CC4<sub>n</sub>, CC8<sub>n</sub> signals:

- Bit control (a bit controls the output pin)
- Transparent mode (IO signal and CIO are linked after level shifter)

According to IO\_SELECT register value and IODIS<sub>n</sub> bits values, one of 4 input pins (IO1, IO2, AUX1 or AUX2) is linked to the selected output.

The idle state is the high level. Each signal is bidirectional.

*Transparent mode arbitration system*

The first between IO and CIO to force a low level becomes the master.

The slave signal is grounded after t1 delay:

$$t1 \text{ max} = 2 * (\text{CLK period}).$$

**Figure 10.** Bidirectional mode

The minimum delay for a pulse at 0 or 1 to be detected is between 0.5 and 1.5 CLK period (depending on arrival time).

If IO and CIO are both grounded, CIO becomes the master.

The minimum delay to switch of master without electrical conflict is equal to:

$$t2 \text{ min} = 4 * (\text{CLK period}) + 2 * (\text{DCCLK period}) * (\text{CLK period}).$$

If a master switch appears before this minimum delay, the electrical conflict delay is:

$$t2 = 2 * (\text{DCCLK period}) * (\text{CLK period})$$

**Figure 11.** Electrical conflict

### **CCLKn and CIO<sub>n</sub> (n=1 to 5) slew rate control**

Three registers SLEW\_CTRL\_1, SLEW\_CTRL\_2 and SLEW\_CTRL\_3 control the slew rate of the CIO<sub>n</sub> and CCLK<sub>n</sub> signals. Each signal has 2 control bits.

An automatic mode is proposed. The VCARD<sub>n</sub>[1:0] value is used to automatically adjust the slew rate.

For specific cases, like long wires between AT83C26 and smart card connector for example, the user can forced the slew rate.

The rising edge and the falling edge are modified with the slew rate control for CCLK<sub>n</sub>.

Only the rising edge is modified on CIO<sub>n</sub> with the slew rate control.

See Table 63. to Table 68. in Electrical Characteristics.

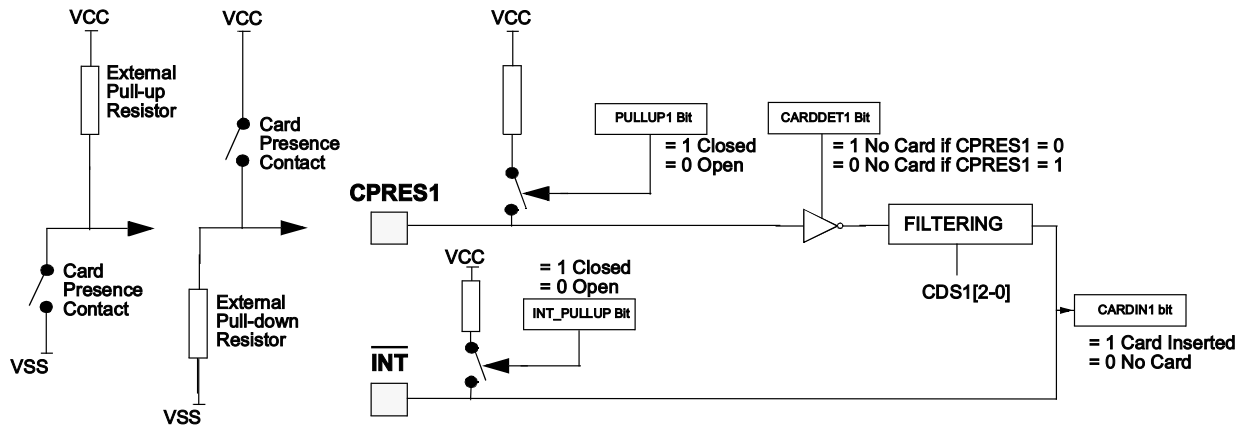

## Card Presence Detection

### Card presence detection for SC1 interface

The card presence signal is connected on the CPRES1 pin. The polarity of card presence contact is selected with the CARDDET1 bit (see SC1\_CFG1 register). A programmable filtering is controlled with the CDS1[2-0] bits.

The internal pull-up on the CPRES1 pin can be disconnected in order to reduce the consumption. An external pull-up must be connected to Vcc. The PULLUP1 bit (see SC1\_CFG1 register) controls this feature.

Figure 12. SC1 presence Input

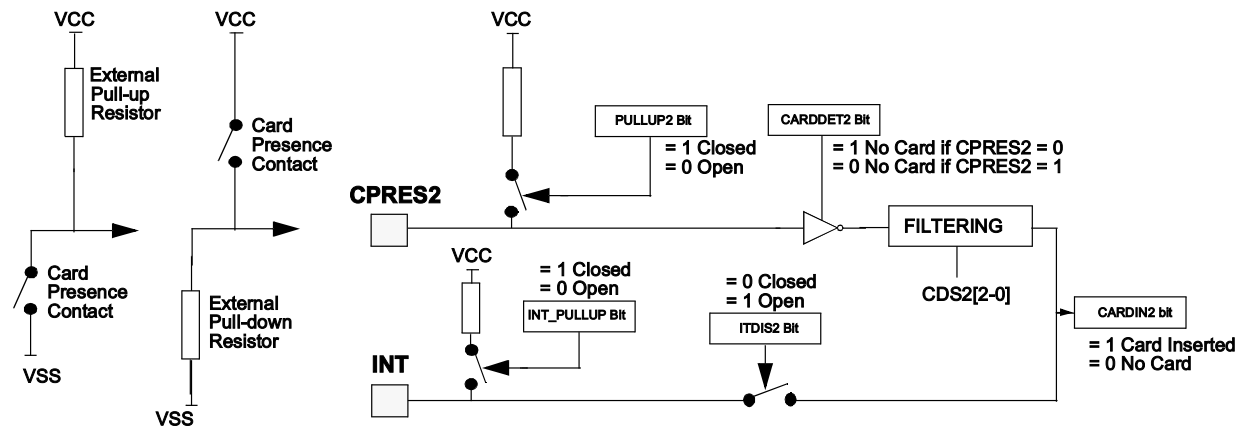

If the card presence contact is connected to Vcc, the internal pull-up must be disconnected and an external pull-down must be connected to the CPRES1 pin.

An interrupt can be generated if a card is inserted or extracted (see Section "Interrupts", page 30).

### Card Presence Detection for SC2 interface

Figure 13. SC2 presence Input

## DC/DC converters

### DC/DC A converter

The DC/DC A converter is controlled by VCARD1[1:0], SHUTDOWNNA, ICCADJA, STEPREGA, VCARD\_OK1 and DEMBOOSTA[1:0] bits.

The DC/DC A converter cannot be switched on while the CPRES1 pin remains inactive. If CPRES1 pin becomes inactive while the DC/DC A converter is operating an automatic shut down sequence of the DC/DC A converter is initiated by the electronics.

A write operation in VCARD1[1:0] (0x01, 0x02, 0x03) starts the DC/DC. When the output voltage remains within the voltage range specified by VCARD1[1:0], the VCARD\_OK1 bit is set.

After a deactivation sequence (card extraction, DC/DC output voltage out of range, SHUTDOWNNA bit =1...) the DC/DC A converter is automatically stopped.

It is mandatory to switch off the DC/DC A converter before entering in Power-down mode.

The DC/DC A Converter can work in two different modes which are selected by STEPREGA bit:

- Pump Mode (STEPREGA = 0): an external inductance of 10  $\mu$ H must be connected between pins LIA and VCC. VCC can be higher or lower than CVCC1.
- Regulator mode (STEPREGA = 1): no external inductance is required but VCC must be always higher than CVCC+0.3V.

The current drawn from power supply by the DC/DC A converter is controlled during the startup phase in order to avoid high transient current mainly in Pump Mode which could cause the power supply voltage to drop dramatically. This control is done by means of bits DEMBOOSTA[1:0], which increases progressively the startup current level.

The DC/DCA sensitivity to any overflow current can be modified (20%) by using the ICCADJA bit (SC1\_CFG3 register).

### Initialization Procedure for DC/DC A converter

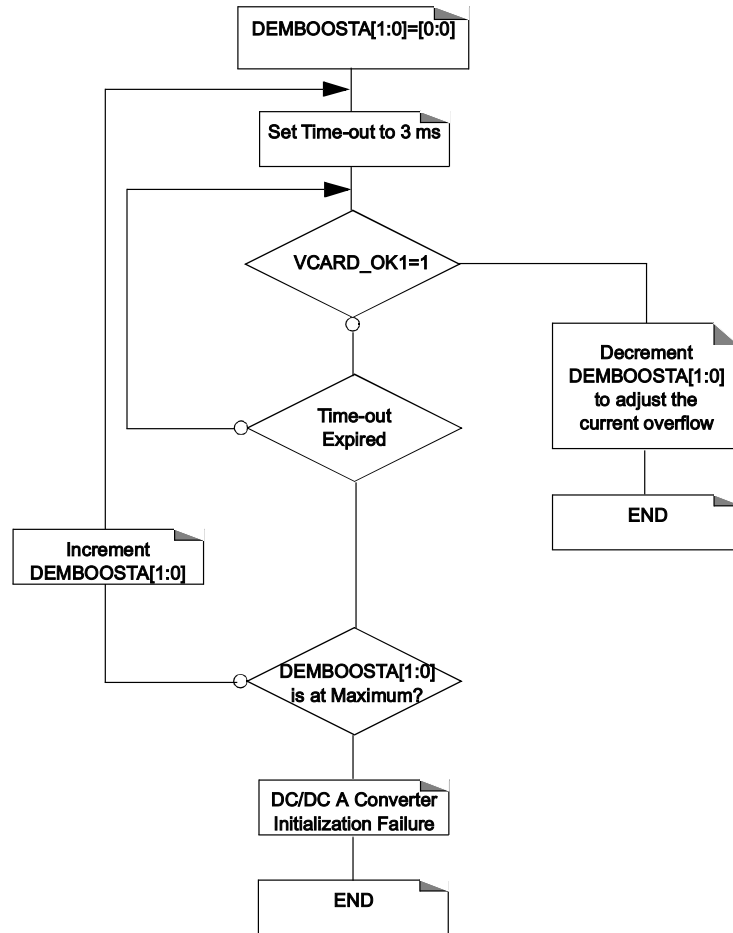

The initialization procedure is described in flow chart:

- Select the CVCC1 level by means of bits VCARD1[1:0] in SC1\_CFG0 register,
- Set bits DEMBOOSTA[1:0] in SC1\_CFG4 register following the current level control wanted.
- Monitor VCARD\_OK1 bit in SC1\_STATUS register in order to know when the DC/DC A Converter is ready (CVCC1 voltage has reached the expected level)

While VCC1 remains higher than 3.6V and startup current lower than 30 mA (depending on the load type), the DC/DC A converter should be ready without having to increment DEMBOOSTA[1:0] bits beyond [0:0] level. If at least one of the two conditions are not met (VCC < 3.6V or startup current > 30 mA), it will be necessary to increment the DEMBOOSTA[1:0] bits until the DC/DC converter is ready.

Increment of DEMBOOSTA[1:0] bits increases at the same time the current overflow level in the same proportion as the startup current. So once the DC/DC converter is ready it is advised to decrement the DEMBOOSTA[1:0] bits to restore the overflow current to its normal or desired value.

Figure 9. DC/DC A Converter Initialization Procedure

**DC/DC B converter**

The DC/DC B converter is controlled by DCDCB register.

The DC/DC B converter can be switched on even if CPRES2 pin remains inactive.

A write operation in VDCB[1:0] (0x01, 0x02, 0x03) starts the DC/DC. When the output voltage remains within the voltage range specified by VDCB\_OK[1:0], the VDCB\_OK bit is set.

The DC/DC B Converter can work in two different modes which are selected by STEPREGB:

- Pump Mode (STEPREGB = 0): an external inductance of 10 μH must be connected between pins LIB and VCC. VCC can be higher or lower than selected voltage.
- Regulator mode (STEPREGB = 1): no external inductance is required but VCC must be always higher than selected voltage+0.3V.

The current drawn from power supply by the DC/DC B converter is controlled during the startup phase in order to avoid high transient current mainly in Pump Mode which could cause the power supply voltage to drop dramatically. This control is done by means of bits DEMBOOSTB[1:0], which increases progressively the startup current level.

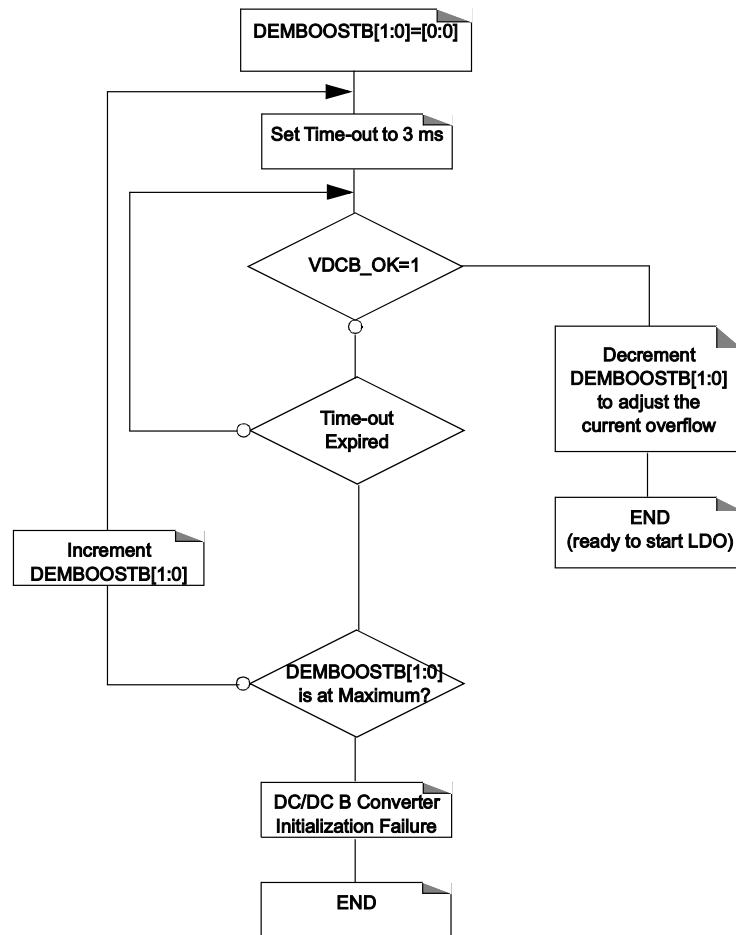

The DC/DCB sensitivity to any overflow current can be modified (20%) by using the ICCADJB bit (DC/DCB register).

### Initialization Procedure for DC/DC B converter

The initialization procedure is described in flow chart:

- Select the DC/DC B level by means of bits VDCB[1:0] in DCDCB register,
- Set bits DEMBOOSTB[1:0] in INTERFACEB register following the current level control wanted.
- Monitor VDCB\_OK bit in DCDCB register in order to know when the DC/DC B Converter is ready

**Figure 10.** DC/DC B Converter Initialization Procedure

Increment of DEMBOOSTB[1:0] bits increases at the same time the current overflow level in the same proportion as the startup current. So once the DC/DC B converter is ready it is advised to decrement the DEMBOOSTB[1:0] bits to restore the overflow current to its normal or desired value.

**LDO initialization Procedure**

When the DC/DC B voltage rises the selected voltage (VDCB\_OK=1), the card voltage selection on CVCC2, CVCC3, CVCC4 or CVCC5 starts the corresponding LDO.

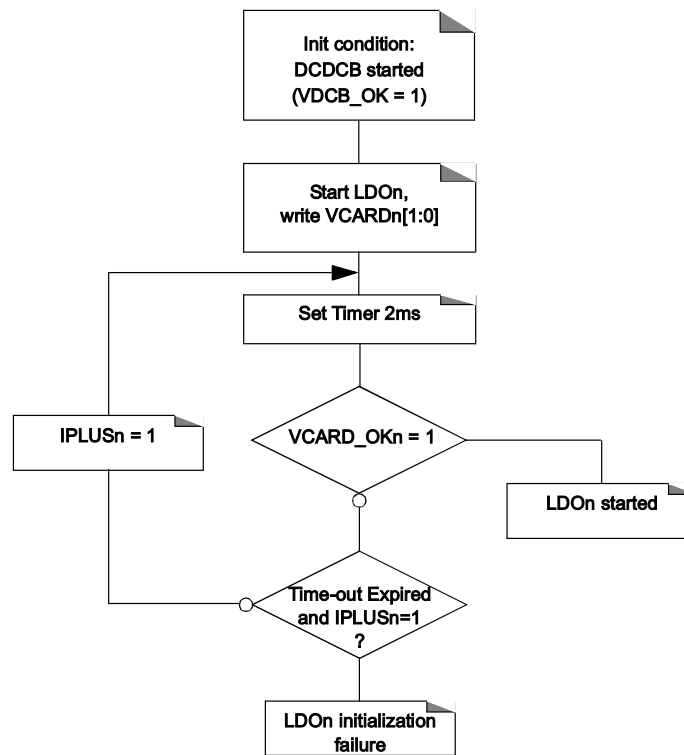

The CVCC2 card voltage must be started in first (if needed). When the VCARD\_OK2 is set, the CVCC3, CVCC4, CVCC5 card voltage are started one after each other (if needed) with the same procedure.

The SC2\_FULL bit must be set to use SC2 full interface:

CIO3/CC42 is CC42 and CRST3/CC82 is CC82.

As the power supply of CIO3/CC42 and of CRST3/CC82 is CVCC3, when SC2\_FULL=1, CVCC3 = CVCC2. The SC3 interface is disable and LDO3 receives LDO2 command (VCARD3[1:0] = VCARD2[1:0]).

**Figure 11. LDO<sub>n</sub> Initialization Procedure (n = 2, 3, 4, 5)**

The LDO<sub>n</sub> output voltage must be at 0V before to program 1.8V/3V/5V.

## Activation Sequence Overview (n=1, 2, 3, 4, 5)

The activation sequence on SC1 is only available if a card is detected on CPRES1 (CARDIN1 bit = 1).

The activation sequence on SC2 is only available if a card is detected on CPRES2 (CARDIN2 bit = 1).

The activation sequence on SC3, SC4, SC5, is only available if DC/DC B is started (VDCB\_OK = 1).

The SCn interface starts the activation sequence after a TWI write command in VCARDn[1:0] bits to program the CVCCn voltage.

The SC3, SC4, SC5 interfaces (SIM/SAM interfaces) don't have card presence detector.

After the DC/DC start, the user application will check the ATR to detect if a SIM/SAM is present in the connector.

The automatic reset transition mode (ART=1) controls the CRST pin and check if the first start bit of the ATR respects ISO7816 timings.

All status bits of an interface (see bits in registers with "This bit is cleared by hardware when this register is read") must be cleared before to start an activation sequence.

### Software Activation for SCn interfaces (n=1, 2, 3, 4, 5) with ARTn bit = 0

The activation sequence is controlled by software using TWI commands, depending on the cards to support. For ISO 7816 cards, the following sequence can be applied:

1. Card Voltage is set by software to the required value (VCARDn[1:0] bits). The TWI writing command in VCARDn[1:0] starts the DC/DC (or LDO).
2. Wait of the end of the DC/DC (or LDO) init with a polling on VCARD\_OKn bit or wait for INT to go Low. When VCARD\_OKn bit is set (by hardware), CARDION bit should be set by software.
3. CKSTOPn, IODISn are programmed by software. CKSTOPn bit is reset to have the clock running. IODISn (see IO\_SELECT for SC2, SC3, SC4, SC5) is reset to enable the transparent mode on CION, CC4n, CC8n.
4. CRSTn pin is controlled by software using CARDRSTn bit.

Figure 14. Software activation without automatic control (ARTn bit = 0)

Note:

- It is assumed that initially VCARDn[1:0], CARDCKn, CARDION and CARDRSTn bits are cleared, CKSTOPn and IODISn are set (those bits are further explained in the registers description)
- The user should check the AT83C26 status and possibly resume the activation sequence if one TWI transfer is not acknowledged during the activation sequence.

Software activation for SCn (n=1, 2, 3, 4, 5) interfaces and ARTn bit = 1

The following sequence can be applied:

1. Card Voltage is set by software to the required value (VCARDn[1:0] bits in SCn\_CFG0 register). This writing starts the DC/DC converter (or LDO).
2. Wait of the end of the DC/DC init (or LDO) with a polling on VCARD\_OKn bit or wait for INT to go Low. When VCARD\_OKn bit is set (by hardware), CARDION bit should be set by software.
3. CKSTOPn, IODISn are programmed by software. CKSTOPn bit is reset to have the clock running. IODISn is reset to enable the transparent mode on CIOn,CC4n, CC8n.
4. CARDRSTn bit is set by software.

Automatic Reset Transition description:

A 16-bit counter starts when CARDRSTn bit is set. It counts card clock cycles. The CRSTn signal is set when the counter reaches the TIMER\_MSB and TIMER\_LSB value which corresponds to the "tb" time (Figure 15).The counter is reseted when the CRSTn pin is released and it is stopped at the first start bit of the Answer To Request (ATR) on CIOn pin.

The CIOn pin is not checked during the first 200 clock cycles (ta, Figure 15). If the ATR arrives before the counter reaches TIMER\_MSB and TIMER\_LSB values, the activation sequence fails,

the CRSTn signal is not set and the CAPTURE\_MSB and CAPTURE\_LSB registers contain the value of the counter at the arrival of the ATR.

If the ATR arrives after the rising edge on CRSTn pin and before the card clock counter overflows (65535 clock cycles), the activation sequence completes. The CAPTURE\_MSB and CAPTURE\_LSB registers contain the value of the counter at the arrival of the ATR ( $t_c$  time on Figure 15).

**Figure 15.** Software activation with ARTn bit = 1

ISO 7816 constraints:  $t_a = 200$  card clock cycles

$400 \text{ card clock cycles} \leq t_b$

$400 \text{ card clock cycles} \leq t_c \leq 40000 \text{ card clock cycles}$

Timer[1-0] reset value is 400.

### Warm reset (n=1, 2, 3, 4, 5)

The AT83C26 offers a simple and accurate way to control the CRSTn signal during a warm reset.

After an activation sequence (cold reset), a warm reset is started with a low level on CRST during a define delay (between 40000 and 45000 clock cycles for example).

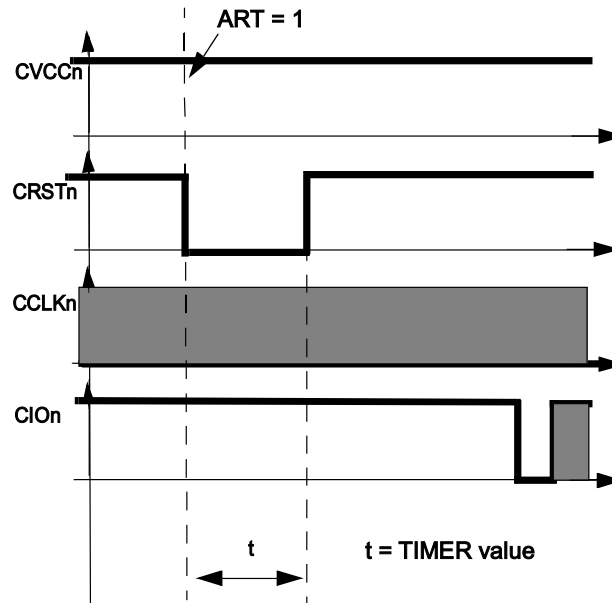

The ARTn bit, the TIMER\_MSB and the TIMER\_LSB are used to control CRSTn.

The first step is to load the number of CCLK cycles with CRSTn=0 in TIMER registers.

The warm reset is started by setting ART bit (if ART bit is already set, reset ART before).

The CRST signal will be equal to 0 during the number of clock cycles programmed in TIMER\_MSB and TIMER\_LSB. Then, the CRST signal will be at 1.

Figure 16. Warm reset with ARTn bit = 1

## Deactivation Sequence Overview

The deactivation sequence should follow the order defined in ISO7816-3 specification. The AT83C26 has two deactivation modes:

- Standard deactivation mode: This mode is used to stop exchange with smart card when the AT83C26 power supply is present. The DCCLK signal is used for deactivation sequence timings.
- Emergency deactivation mode: This mode is used when the AT83C26 power supply is taken off.

### Deactivation sequence on SCn interface (n=1, 2, 3, 4, 5)

The card automatic deactivation is triggered when one of the following conditions occurs:

- ICARDERR1 bit is set by hardware (SC1)
- VCARDERRn bit is set by hardware (or by software)
- INSERT1 is set and CARDIN1 is cleared (SC1)
- INSERT2 is set and CARDIN2 is cleared (SC2)
- SHUTDOWNNA bit is set by software (SC1)
- SHUTDOWNNB bit is set by software (SC2, SC3, SC4, SC5)

- Reset pin going low (SC1, SC2, SC3, SC4, SC5)
- Power Fail (VPFDP)

It is a self-timed sequence which cannot be interrupted when started (see Figure 17). Each step is separated by a delay based on  $T_d$  equal to 8 periods of DCCLK, typically 2 to 2.4  $\mu$ s:

1.  $T_0$ : CARDRSTn is cleared, SHUTDOWNn (for SC1) bit is set.
2.  $T_0 + 5 \times T_d$ : CARDCKn is cleared, CKSTOPn, CARDION and IODIS are set.
3.  $T_0 + 6 \times T_d$ : CARDION is cleared.
4.  $T_0 + 7 \times T_d$ : VCARDn[1:0] = 00.

**Figure 17. Deactivation Sequence**

- Notes:
1. Setting ICARDERR1 by software does not trigger a deactivation on SC1. VCARDERRn can be used to deactivate the card by software.
  2. If CCLKn=A2 or A2/2, deactivation follows fig13 with 2 timing modifications:  $t_1=5.5 \times T_d$  and  $t_2=0.5 \times T_d$ .
  3.  $T_d$  is based on DCCLK clock.

#### Emergency deactivation sequence on SCn interface (n=1, 2, 3, 4, 5)

The card emergency automatic deactivation is triggered when one of the following conditions occurs:

- Software TWI Reset (SC1, SC2, SC3, SC4, SC5)
- Power fail on VCC (SC1, SC2, SC3, SC4, SC5)

If the power supply is disconnected, a standard deactivation is started when  $VCC = VPFDP$ . When VCC is equal to VPFDM, the emergency deactivation occurs and eventually ends the standard deactivation.

Figure 18. Power Fail Detection

Figure 19. Emergency deactivation sequence

During an emergency deactivation, the signals fall according to the order described in Fig18.

## Transparent mode

### Full transparent mode on SCn interfaces (n=1, 2)

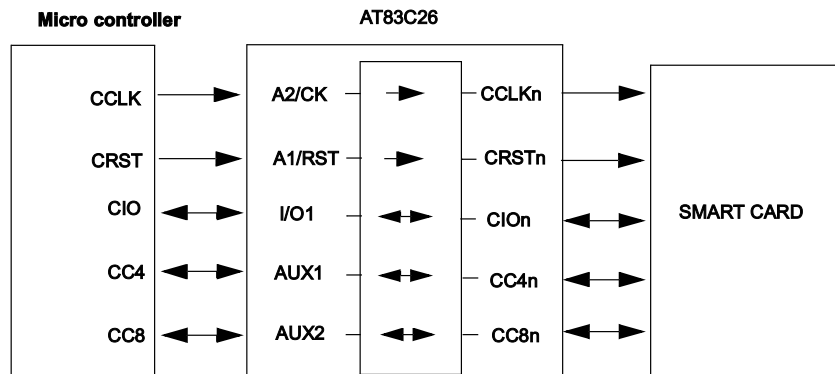

If the micro controller outputs ISO 7816 signals, a transparent mode allows to connect, CCLK, CIO, CRST, CC4 and CC8 signals on outputs after an electrical level control. The AT83C26 level shifters adapt the card signals to the smart card voltage selection.

The CCLK micro controller signal can be connected to the A2/CK pins (see CKSn[2:0]).

CKSn[2:0] bits allow to select standard or transparent configuration for the CCLKn pin. A2/CK inputs always give the TWI address at reset.

If A2/CK input is tied to the host micro controller and its reset value is unknown, a general call on the TWI bus allows to reset all the AT83C26 devices and set its address after A2/CK input is fixed.

**Figure 20. Transparent Mode Description**

**Full transparent mode on SCn interfaces (n= 3, 4, 5)**

The transparent mode with A2/CK is also available for SC3, SC4 and SC5 interfaces without CC4 and CC8.

**Figure 21. Transparent Mode Description**

## Interrupts

The  $\overline{\text{INT}}$  output is High by default.  $\overline{\text{INT}}$  is driven Low by at least one of the following event:

- INSERT1 or INSERT2 bits set (card insertion/extraction or bit set by software)
- VCARD\_INTn (n=1,2,3,4,5) bits set (the DC/DC A or LDO2 to LDO5 output voltage has settled)
- VDCB\_INT bit set (the DC/DC B output voltage has settled)
- over-current detection on CVCC1
- VCARDERRn bit set (out of range voltage on CVCCn or bit set by software) (n=1,2,3,4,5)
- ATRERRn bit set (no ATR before the card clock counter overflows or bit set by software) (n=1,2,3,4,5)

Several AT83C26 devices can share the same interrupt pin and the micro controller can identify the interrupt sources by polling the interrupt bits of the AT83C26 devices using TWI commands.

A TWI read command of the interrupt bit corresponding to the IT clears the bit. When all IT bits are cleared, the INT output becomes high.

The ITDIS register contains 4 bits to control SCn interrupts (n= 2,3,4,5). If ITDISn bit is set, the flags are set but the INT pin isn't driven low if an interrupt event appears.

**Table 4.** Interrupt bits description

Bit name	Register name	Mask on INT pin	Remark
INSERT1	SC1_CFG0		Smart card inserted/extracted in SC1
INSERT2	SC2_CFG0	ITDIS2	Smart card inserted/extracted in SC2
VCARD_INT1	SC1_STATUS		VCARD_OK1 is set
VCARD_INT2	SC2_CFG0	ITDIS2	VCARD_OK2 is set
VCARD_INT3	SC3_CFG0	ITDIS3	VCARD_OK3 is set
VCARD_INT4	SC4_CFG0	ITDIS4	VCARD_OK4 is set
VCARD_INT5	SC5_CFG0	ITDIS5	VCARD_OK5 is set
VDCB_INT	DCDCB		VDCB_OK is set
ICARDERR1	SC1_CFG0		Over current on DCDCA.
VCARDERR1	SC1_CFG0		Ouput voltage out of range on DCDCA
VCARDERR2	SC2_CFG0	ITDIS2	Ouput voltage out of range on LDO2
VCARDERR3	SC3_CFG0	ITDIS3	Ouput voltage out of range on LDO3.
VCARDERR4	SC4_CFG0	ITDIS4	Ouput voltage out of range on LDO4
VCARDERR5	SC5_CFG0	ITDIS5	Ouput voltage out of range on LDO5
ATRERR1	SC1_CFG0		Error on SC1 for ATR reception in automatic mode
ATRERR2	SC2_CFG0	ITDIS2	Error on SC2 for ATR reception in automatic mode
ATRERR3	SC3_CFG0	ITDIS3	Error on SC3 for ATR reception in automatic mode
ATRERR4	SC4_CFG0	ITDIS4	Error on SC4 for ATR reception in automatic mode
ATRERR5	SC5_CFG0	ITDIS5	Error on SC5 for ATR reception in automatic mode

After the reading and the clear of the interrupt bits, several bits are used to control the status.

**Table 5.** Status bits description

Bit name	Register name	Remark
CARDIN1	SC1_STATUS	Smart card presence in SC1
CARDIN2	SC1_STATUS	Smart card presence in SC2
VCARD_OK1	SC1_STATUS	CVCC1 voltage in range programmed in VCARD1[1:0]
VCARD_OK2	SC2_CFG0	CVCC2 voltage in range programmed in VCARD2[1:0]
VCARD_OK3	SC3_CFG0	CVCC3 voltage in range programmed in VCARD3[1:0]
VCARD_OK4	SC4_CFG0	CVCC4 voltage in range programmed in VCARD4[1:0]
VCARD_OK5	SC5_CFG0	CVCC5 voltage in range programmed in VCARD5[1:0]
VDCB_OK	DCDCB	CVCCB voltage in range programmed in VDCB[1:0]

The status for the ICARDERR1 and VCARDERRn (n= 1 to 5) bits is controlled with VCARD\_OKn bits.

The status for the ATRERRn (n= 1 to 5) is controlled by reading of values in CAPTURE\_MSB and CAPTURE\_LSB.

### Slew rate control

The AT83C26 proposed a slew rate control on CIO<sub>n</sub> and CCLK<sub>n</sub> pins (n=1, 2, 3, 4, 5). The control operates on rising and falling edges of CCLK<sub>n</sub> and only on rising edge of CIO<sub>n</sub>.

Four modes are available:

- Automatic mode: The slew rate depends on VCARD<sub>n</sub>[1:0] value. The slew rate value is optimized according to CVCC<sub>n</sub>.
- Mode 1, 2, 3 (1.8V, 3V, 5V): The user can forced the slew rate if needed. For example if CVCC<sub>n</sub> = 5V, the user can program 1.8V or 3V to speed up the slew rate in case of long wire connection between AT83C26 and smart cards.

### Power down mode

SHUTDOWN<sub>A</sub> bit and SHUTDOWN<sub>B</sub> bit must be set to activate power down mode on DCDC<sub>A</sub> and DCDC<sub>B</sub> converters.

If SHUTDOWN<sub>A</sub> = SHUTDOWN<sub>B</sub> = 1, the AT83C26 internal regulator also enters in power down mode. The consumption is then about 30μA.

To exit from power down mode, TWI commands are needed to clear SHUTDOWN<sub>A</sub> and SHUTDOWN<sub>B</sub>.

## Write Commands

The write commands are:

1. **General Call Reset:**  
A general call followed by the value 06h has the same effect as a Reset command.
2. **Reset:**  
Initialize all the logic and the TWI interface as after a power-up or power-fail reset. If the interface is activated, an emergency de-activation sequence is also performed. This is a one-byte command.
3. **Write SC1\_CFG0, SC1\_CFG1, SC1\_CFG2, SC1\_CFG3, SC1\_CFG4:**  
Configure the device according to the last six bits in the SC1\_CFG0 register and to the following four bytes in SC1\_CFG1, SC1\_CFG2, SC1\_CFG3 then SC1\_CFG4 registers. This is a five bytes command.

**Figure 22.** Command byte format for Write SC1\_CFG0 command

b7	b6	b5	b4	b3	b2	b1	b0
1	0	X	X	X	X	X	X

SC1\_CFG0 on 6 Bits

4. **Write TIMER\_MSB, TIMER\_LSB:**  
Program the 16-bit automatic reset transition timer with the following two bytes. This is a three bytes command.
5. **Write SC1\_INTERFACE:**  
Program the interface byte. This is a one-byte command. The MSB of the command byte is fixed at 0.
6. **Write common config smart cards:**  
IO\_SELECT, INTERFACE\_B, ITDIS:  
Configuration of parameters for smart card interfaces.
7. **Write SC2 interface: SC2\_CFG0, SC2\_CFG1, SC2\_CFG2**  
Configuration of smart card interface 2.
8. **Write SC3 interface: SC3\_CFG0, SC3\_CFG2**  
Configuration of SIM/SAM interface 3.
9. **Write SC4 interface: SC4\_CFG0, SC4\_CFG2**  
Configuration of SIM/SAM interface 4.

- 10. Write SC5 interface: SC5\_CFG0, SC5\_CFG2  
Configuration of SIM/SAM interface 5.
- 11. Write DCDCB config: DCDCB, LDO  
Configuration of DCDCB converter.
- 12. Write SLEW\_CTRL config: SLEW\_CTRL\_1, SLEW\_CTRL\_2, SLEW\_CTRL\_3  
Configuration of slew rate for CCLKn and CIO<sub>n</sub> (n = 1, 2, 3, 4, 5).

**Table 6. Write Commands Description**

	Address Byte (See Table 2)	Command Byte	Data Byte 1	Data Byte 2	Data Byte 3	Data Byte 4

<b>12. Write SLEW_CTRL config</b>	0100 XX10	1111 0111	SLEW_CTRL_1	SLEW_CTRL_2	SLEW_CTRL_3	

**Read Command**

After a write command, even with a length of 0 byte, the next read operation is performed on the corresponding byte. The write command sets the “read pointer”.

After the reset, the “read pointer” is on SC1 registers

FFh is completing the transfer if the micro controller attempts to read beyond the last byte.

Flags are only reseted after the corresponding byte read has been acknowledged by the master.

**Figure 23. Read command byte**

## Registers

**Table 17.** SC1\_CFG0(Config Byte 0 for SC1)

7	6	5	4	3	2	1	0
1	0	ATRERR1	INSERT1	ICARDERR1	VCARDERR1	VCARD11	VCARD10
Bit Number	Bit Mnemonic	Description					
7-6	1-0	These bits cannot be programmed and are read as 1-0.					
5	ATRERR1	<p>Answer to Reset Interrupt for SC1            This bit is set when the card clock counter overflows (no falling edge on CIO1 is received before the overflow of the card clock counter).            This bit is cleared by hardware when this register is read. It can be set by software for test purpose.</p>					
4	INSERT1	<p>Card Insertion Interrupt            This bit is set when a card is inserted or extracted: a change in CARDIN value filtered according to CDS[2-0]. It can be set by software for test purpose.            This bit is cleared by hardware when this register is read. It cannot be cleared by software.</p>					
3	ICARDERR1	<p>Card Over Current Interrupt            This bit is set when an over current is detected on CVCC. It can be set by software for test purpose (no card deactivation is performed).            This bit is cleared by hardware when this register is read. It cannot be cleared by software.</p>					
2	VCARDERR1	<p>Card Out of Range Voltage Interrupt            This bit is set when the output voltage goes out of the voltage range specified by VCARD field. It can be set by software for test purpose and deactivate the card.            This bit is cleared by hardware when this register is read. It cannot be cleared by software.</p>					
1-0	VCARD1[1:0]	<p>Card Voltage Selection            VCARD1[1:0] = 00: 0V            VCARD1[1:0] = 01: 1.8V            VCARD1[1:0] = 10: 3V            VCARD1[1:0] = 11: 5V            VCARD1[1:0] writing to 1.8V, 3V, 5V starts the DC/DC if a card is detected.            VCARD1[1:0] writing to 0 stops the DC/DC.            No card deactivation is performed when the voltage is changed between 1.8V, 3V or 5V. The micro controller should deactivate the card before changing the voltage.</p>					

Reset value = 0x 1000 0000

**Table 18.** SC1\_CFG1 (Config Byte 1 for SC1)

7	6	5	4	3	2	1	0
X	ART1	SHUTDOWNA	CARDDET1	PULLUP1	CDS12	CDS11	CDS10
Bit Number	Bit Mnemonic	Description					
7	X						
6	ART1	Automatic Reset Transition Set this bit to have the CRST1 pin changed according to activation sequence. Clear this bit to have the CRST1 pin immediately following the value programmed in CARDRST1.					
5	SHUTDOWNA	Shutdown DC/DCA Set this bit to reduce the power consumption. An automatic de-activation sequence will be done. VCARD[1:0] bits are reset. Clear this bit to enable VCARD1[1:0] selection.					
4	CARDDET1	Card Presence Detection Polarity Set this bit to indicate the card presence detector is closed when no card is inserted (CPRES is low). Clear this bit to indicate the card presence detector is open when no card is inserted (CPRES is high).					
3	PULLUP1	Pull-up Enable Set this bit to enable the internal pull-up on the CPRES pin. This allows to minimize the number of external components. Clear this bit to disable the internal pull-up and minimize the power consumption when the card detection contact is on. Then an external pull-up must be connected to V <sub>CC</sub> (typically a 1 MΩ resistor).					
2-0	CDS1[2:0]	Card Detection filtering CPRES1 is sampled by the master clock provided on CLK input. A change on CPRES1 is detected after: CDS1[2-0] = 0: no sample <sup>(1)</sup> CDS1[2-0] = 1: 4 identical samples CDS1[2-0] = 2: 8 identical samples (reset value) CDS1[2-0] = 3: 16 identical samples CDS1[2-0] = 4: 32 identical samples CDS1[2-0] = 5: 64 identical samples CDS1[2-0] = 6: 128 identical samples CDS1[2-0] = 7: 256 identical samples Note: 1. When CDS[2-0] = 0, a card insertion (even if CLK is stopped) puts a low level on $\overline{INT}$ pin. This can be used to wake up the external micro controller and restart CLK when a card is inserted in the AT83C24.					

Reset value = 0x X000 1010

**Table 19. SC1\_CFG2 (Config Byte 2 for SC1)**

7	6	5	4	3	2	1	0
0	DCK2	DCK1	DCK0	X	CKS12	CKS11	CKS10
Bit Number	Bit Mnemonic	Description					
7	0	This bit must be always at 0.					
6-4	DCK[2:0]	DCK is the first level of prescaler factor. CLK signal is divided by the prescaler value and outputs DCCLK signal. DCCLK is an input for CCLK prescaler. DCK[2:0] = 0: prescaler factor equals 1 DCK[2:0] = 1: prescaler factor equals 2 DCK[2:0] = 2: prescaler factor equals 4 DCK[2:0] = 3: prescaler factor equals 6 DCK[2:0] = 4: prescaler factor equals 8 DCK[2:0] = 5: prescaler factor equals 10 DCK[2:0] = 6: prescaler factor equals 12 DCK[2:0] = 7: Reserved DCCLK is used for pad management and deactivation sequence.					
3	X						
2-0	CKS1[2:0]	Card Clock prescaler factor for CCLK1. CKS1 [2:0] = 0: CCLK1 = CLK (the maximum frequency on CLK is 24 MHz) CKS1 [2:0] = 1: CCLK1 = DCCLK CKS1[2:0] = 2: CCLK1 = DCCLK / 2 CKS1[2:0] = 3: CCLK1 = DCCLK / 4 CKS 1[2:0] = 4: CCLK1 = A2 CKS1 [2:0] = 5: CCLK1 = A2 / 2 CKS1[2:0] = 6: CCLK1 = CLK / 2 CKS1 [2:0] = 7: CCLK1 = CLK / 4					

Reset value = 0x 0001 X000

- Notes:
1. When CKS1 value is changed a special logic insures no glitch occurs on the CCLK1 pin and actual configuration changes can be delayed by half a period to two periods of CCLK1.
  2. CCLK1 must be stopped with CKSTOP1 bit before switching from CKS1 = (0, 1, 2, 3, 6, 7) to CKS1 = (4, 5) or vice versa.

Bit Number	Bit Mnemonic	Description					
7	X						
6-5	DEMBOOSTA[1-0]	DC/DC A Maximum Startup Current drawn from power supply 00: Normal: 80 mA average 01: Normal + 18% 10: Normal + 18% (and boost on oscillator) 11: Normal + 40%					
4	STEPREGA	Step Regulator mode Clear this bit to enable the automatic step-up converter (CVCC is stable even if VCC is not higher than CVCC). Set this bit to permanently disable the step-up converter (CVCC is stable only if VCC is sufficiently higher than CVCC). This bit must always be set if no external self is used					
3	INT_PULLUP	Internal pull-up Set this bit to activate the internal pull-up (connected internally to VCC) on $\overline{\text{INT}}$ pin. Clear this bit to deactivate the internal pull-up.					
2	X						
1	X						
0	CRST_SEL1	Card Reset Selection Set this bit to have the CRST1 pin driven by hardware through the A1/RST pin. Clear this bit to have the CRST1 pin driven by software through the CARDRST bit. The reset value is 0.					

Reset value = 0x X000 0000

**Table 22.** SC1\_INTERFACE (Interface Byte for SC1)

7	6	5	4	3	2	1	0	
0	IODIS1	CKSTOP1	CARDRST1	CARDC81	CARDC41	CARDCK1	CARDIO1	
Bit Number	Bit Mnemonic	Description						
7	0	This bit should not be set.						
6	IODIS1	Card I/O isolation Set this bit to drive the CIO1, CC41, CC81 pins according to CARDIO1, CARDC41, CARDC81 respectively. Clear this bit to drive the CIO1, CC41 and CC81 pins connected to inputs according to IOSEL[3/0] bits.						
5	CKSTOP1	CARD Clock Stop Set this bit to stop CCLK1 according to CARDCK1. This can be used to set asynchronous cards in power-down mode (GSM) or to drive CCLK1 by software. Clear this bit to have CCLK1 running according to CKS1. This can be used to activate asynchronous cards. Note: When this bit is changed a special logic ensures that no glitch occurs on the CCLK1 pin and actual configuration changes can be delayed by half a period to two periods of CCLK1.						
4	CARDRST1	Card Reset Set this bit to enter a reset sequence according to ART1 bit value. Clear this bit to drive a low level on the CRST1 pin.						
3	CARDC81	Card C8 Set this bit to drive the CC81 pin High with the on-chip pull-up (according to IODIS1 bit value). The pin can then be an input (read in SC1_STATUS register). Clear this bit to drive a low level on the CC81 pin (according to IODIS1 bit value).						
2	CARDC41	Card C4 Set this bit to drive the CC41 pin High with the on-chip pull-up (according to IODIS1 bit value). The pin can then be an input (read in SC1_STATUS register). Clear this bit to drive a low level on the CC41 pin (according to IODIS1 bit value).						
1	CARDCK1	Card Clock Set this bit to set a high level on the CCLK1 pin (according to CKSTOP1 bit value). Clear this bit to drive a low level on the CCLK1 pin.						
0	CARDIO1	Card I/O Set this bit to drive the CIO1 pin High with the on-chip pull-up (according to IODIS1 bit value). The pin can then be an input (read in SC1_STATUS register). Clear this bit to drive a low level on the CIO1 pin (according to IODIS1 bit value).						

Reset value = 0x 0110 0000

7	VCARD_INT5	SC5 voltage interrupt This bit is set when VCARD_OK5 bit is set. This bit is cleared when read by the micro controller.					
6	VCARD_OK5	SC5 Voltage Status This bit is set by the LDO5 when the output voltage remains within the voltage range specified by VCARD5[1:0] bits. It is cleared otherwise.					
5	ATRERR5	Answer to Reset Interrupt for SC5 This bit is set when the card clock counter overflows (no falling edge on CIO5 is received before the overflow of the card clock counter). This bit is cleared by hardware when this register is read. It can be set by software for test purpose.					
4	X						
3	X						
2	VCARDERR5	Interface 5 Card Out of Range Voltage Interrupt This bit is set when the output voltage on CVCC <sub>N</sub> goes out of the voltage range specified by VCRDN field. It can be set by software for test purpose and deactivate the card. This bit is cleared by hardware when this register is read. It cannot be cleared by software. The reset value is 0.					
1-0	VCARD5[1:0]	Interface 5 Card Voltage Selection VCRD5[1:0] = 00: 0V VCRD5[1:0] = 01: 1.8V class C VCRD5[1:0] = 10: 3V class B VCRD5[1:0] = 11: 5V class A No card deactivation is performed when the voltage is changed. The micro controller should deactivate the card before changing the voltage and activating the card again. The reset value is 00.					

Reset value = 0x 000X X000

**Table 32. SC5\_CFG2 ()**

7	6	5	4	3	2	1	0
ART5	X	CARDRST5	CARDCK5	CKSTOP5	CKS52	CKS51	CKS50
Bit Number	Bit Mnemonic	Description					
7	ART5	Automatic Reset Transition Set this bit to have the CRST5 pin changed according to activation sequence. Clear this bit to have the CRST5 pin immediately following the value programmed in CARDRST5.					
6	X						
5	CARDRST5	Card Reset Set this bit to enter a reset sequence according to ART5 bit value. Clear this bit to drive a low level on the CRST5 pin.					
4	CARDCK5	Card Clock Set this bit to set a high level on the CCLK5 pin (according to CKSTOP5 bit value). Clear this bit to drive a low level on the CCLK5 pin.					
3	CKSTOP5	CARD Clock Stop Set this bit to stop CCLK5 according to CARDCK5. This can be used to set asynchronous cards in power-down mode (GSM) or to drive CCLK5 by software. Clear this bit to have CCLK5 running according to CKS5. This can be used to activate asynchronous cards. Note: When this bit is changed a special logic ensures that no glitch occurs on the CCLK5 pin and actual configuration changes can be delayed by half a period to two periods of CCLK5.					
2-0	CKS5[2:0]	Interface 5Card Clock Selection CKS5 [2:0] = 0: CCLK5 = CLK (then the maximum frequency is 24 MHz) CKS5 [3:0] = 1: CCLK5 = DCCLK CKS5 [3:0] = 2: CCLK5 = DCCLK / 2 CKS5 [3:0] = 3: CCLK5 = DCCLK / 4 CKS5 [3:0] = 4: CCLK5= A2 CKS5 [3:0] = 5: CCLK5 = A2 / 2 CKS5 [3:0] = 6: CCLK5 = CLK / 2 CKS5 [3:0] = 7: CCLK5 = CLK / 4 The reset value is 0.					

Reset value = 0x 0X00 1000

- Notes:
1. When CKS5 value is changed a special logic insures no glitch occurs on the CCLK5 pin and actual configuration changes can be delayed by half a period to two periods of CCLK5.
  2. CCLK5 must be stopped with CKSTOP5 bit before switching from CKS5 = (0, 1, 2, 3, 6, 7) to CKS5 = (4, 5) or vice versa.

Reset value for IOSEL[3:0]= 0x1000

- Note:
1. If no input (IO1, IO2, AUX1, AUX2) is selected for a SCIB pin (CIO<sub>n</sub>, CC4<sub>n</sub> CC8<sub>n</sub>), and if the smart card interface is started, the electrical level on the SCIB pin corresponds to the CARDIO<sub>n</sub>, CARDC4<sub>n</sub> or CARDC8<sub>n</sub> bit value.
  2. For IOSEL[3:0] = 0x0E and IOSEL[3:0] = 0x0F, the CARDRST3 bit must be set to connect AUX2 to CRST3/CC82 pin.

**Table 39. INTERFACEB ()**

7	6	5	4	3	2	1	0
X	CARDC82	CARDIO5	CARDIO4	CARDIO3/CARDC42	CARDIO2	DEMBOOSTB1	DEMBOOSTB0
Bit Number	Bit Mnemonic	Description					
7	X						
6	CARDC82	Set this bit to drive the CRST3/CC82 pin High with the on-chip pull-up (according to IODIS2 bit value). The pin can then be an input (read in STATUSB register). Clear this bit to drive a low level on the CC82 pin (according to IODIS2 bit value).					
5	CARDIO5	Set this bit to drive the CIO5 pin High with the on-chip pull-up when isolated from the host (See "ITDIS ()" on page 59.). The pin can then be an input (read in STATUSB register). Clear this bit to drive a low level on the CIO5 pin when isolated from the host.					
4	CARDIO4	Set this bit to drive the CIO4 pin High with the on-chip pull-up when isolated from the host (See "ITDIS ()" on page 59.). The pin can then be an input (read in STATUSB register). Clear this bit to drive a low level on the CIO4/C45 pin when isolated from the host.					
3	CARDIO3/ CARDC42	Set this bit to drive the CIO3/CC42 pin High with the on-chip pull-up when isolated from the host (See "ITDIS ()" on page 59.). The pin can then be an input (read in STATUSB register). Clear this bit to drive a low level on the CIO3/CC42 pin when isolated from the host. This bit is CIO3 when AUX=0 or when AUX=1 and IFN=2, otherwise it is CC42.					
2	CARDIO2	Set this bit to drive the CIO2 pin High with the on-chip pull-up when isolated from the host (See "ITDIS ()" on page 59.). The pin can then be an input (read in STATUSB register). Clear this bit to drive a low level on the CIO2 pin when isolated from the host.					
1-0	DEMBOOSTB[1-0]	Configuration for DC/DCB startup current. 00: Normal: 80 mA average 01: Normal + 18% 10: Normal + 18% (and boost on oscillator) 11: Normal + 40%

Bit Number	Bit Mnemonic	Description					
7	X						
6	CARDIN2	Card Presence Status 2 This bit is set when a card is detected. It is cleared otherwise.					
5	CIO5	Card CIO5 This bit provides the actual level on the CIO5 pin when read.					
4	CIO4	Card CIO4 This bit provides the actual level on the CIO4 pin when read.					
3	CRST3/CC82	Card CRST3 This bit provides the actual level on the CRST3 pin when read.					
2	CIO3/CC42	Card CIO3 This bit provides the actual level on the CIO3 pin when read.					
1	CRST2	Card CRST2 This bit provides the actual level on the CRST2 pin when read.					
0	CIO2	Card CIO2 This bit provides the actual level on the CIO2 pin when read.					

Reset value = reset value depends on hardware configuration

Table 41. ITDIS ()

7	6	5	4	3	2	1	0
IODIS5	IODIS4	IODIS3	IODIS2	ITDIS5	ITDIS4	ITDIS3	ITDIS2
Bit Number	Bit Mnemonic	Description					
7	IODIS5	Card I/O isolation Set this bit to drive CIO5 pin according to CARDIO5. Clear this bit to drive the CIO5 pin connected to inputs according to IO_SELECT registers. If IOSEL config doesn't link an input to CIO5, CIO5 outputs CARDIO5 value.					
6	IODIS4	Card I/O isolation Set this bit to drive CIO4 pin according to CARDIO4. Clear this bit to drive the CIO4 pin connected to inputs according to IO_SELECT registers. If IOSEL config doesn't link an input to CIO4, CIO4 outputs CARDIO4 value.					
5	IODIS3	Card I/O isolation Set this bit to drive CIO3 pin according to CARDIO3. Clear this bit to drive the CIO3 pin connected to inputs according to IO_SELECT registers. If IOSEL config doesn't link an input to CIO3, CIO3 outputs CARDIO3 value.					
4	IODIS2	Card I/O isolation Set this bit to drive the CIO2, CC42, CC82 pins according to CARDIO2, CARD42, CARD82 respectively. Clear this bit to drive the CIO2, CC42 and CC82 pins connected to inputs according to IO_SELECT register. If IOSEL config doesn't link an input to CIO2, CIO2 outputs CARDIO2 value.					
3	ITDIS5	Interrupt Disable of Smart Card Interface 5 Set this bit to disable interrupts from the interface 5 (the flags are set but $\overline{INT}$ pin is not driven). Clear this bit to allow interrupts.					
2	ITDIS4	Interrupt Disable of Smart Card Interface 4 Set this bit to disable interrupts from the interface 4 (the flags are set but $\overline{INT}$ pin is not driven). Clear this bit to allow interrupts.					
1	ITDIS3	Interrupt Disable of Smart Card Interface 3 Set this bit to disable interrupts from the interface 3 (the flags are set but $\overline{INT}$ pin is not driven). Clear this bit to allow interrupts.					
0	ITDIS2	Interrupt Disable of Smart Card Interface 2 Set this bit to disable interrupts from the interface 2 (the flags are set but $\overline{INT}$ pin is not driven). Clear this bit to allow interrupts.					

Reset value = 0x 1111 0010

**Table 42.** DCDCB (Config Interface B Byte 2)

7	6	5	4	3	2	1	0
SHUTDOWNB	VDCB_INT	VDCB_OK	0	ICCADJB	STEPREGB	VDCB1	VDCB0
Bit Number	Bit Mnemonic	Description					
7	SHUTDOWNB	Shutdown DCDCB Set this bit to reduce the power consumption. An automatic de-activation sequence will be done. Clear this bit to enable VDCB. The reset value is 0.					
6	VDCB_INT	DC/DC B voltage interrupt This bit is set when VCARD_OKB bit is set. This bit is cleared when read by the micro controller. The reset value is 0.					
5	VDCB_OK	DC/DC B Voltage Status This bit is set by the DCDC when the output voltage remains within the voltage range specified by VDCB[1:0] bits. It is recommended to wait for this bit to be set before activating a card at the corresponding voltage. It is cleared otherwise. The reset value is 0.					
4	0	This bit must be always at 0.					
3	ICCADJB	Cl <sub>CC</sub> overflow adjust This bit controls the DC/DCB sensitivity to any overflow current. Set this bit to decrease the DC/DCB sensitivity (Cl <sub>CC_ovf</sub> is increased by about 20%). Clear this bit to have a normal configuration. The reset value is 0.					
2	STEPREGB	DC/DC B Step-up Regulator Mode Set this bit to permanently disable the step-up converter (CVCC is stable only if VCC is sufficiently higher than CVCC). This bit must always be set if no external self is used. Clear this bit to enable the automatic step-up converter (CVCC is stable even if VCC is not higher than CVCC). The reset value is 0.					
1-0	VDCB[1:0]	DC/DC B Voltage Selection VDCB[1:0] = 00: 0V VDCB[1:0] = 01: 2.2V (for Class C) VDCB[1:0] = 10: 3.2V (for Class B and C) VDCB[1:0] = 11: 5.2V (for Class A, B and C) No card deactivation is performed when the voltage is changed. The voltage must be set higher than the voltage of all the active cards. If a Class A card is deactivated and the remaining cards are in Class B or C, VDCB can be reduced to 3.2V to reduce power consumption. If a Class B card is deactivated and the remaining cards are in Class C, VDCB can be reduced to 2.2V to reduce power consumption. It is not reset when cards are deactivated. It must be cleared by the micro controller to stop DC/DC B (e.g. to reduce power consumption). The reset value is 00.
