

Three Port 10/100 Managed Ethernet Switch with MII

PRODUCT FEATURES

Datasheet

Highlights

- High performance and full featured 3 port switch with VLAN, QoS packet prioritization, Rate Limiting, IGMP Snooping and management functions
- Serial management via SPI/I²C or SMI
- Unique Virtual PHY feature simplifies software development by mimicking the multiple switch ports as a single port PHY
- Integrated IEEE 1588 Hardware Time Stamp Unit

Target Applications

- Cable, satellite, and IP set-top boxes
- Digital televisions
- Digital video recorders
- VoIP/Video phone systems
- Home gateways
- Test/Measurement equipment
- Industrial automation systems

Key Benefits

- Ethernet Switch Fabric
 - 32K buffer RAM
 - 1K entry forwarding table
 - Port based IEEE 802.1Q VLAN support (16 groups)
 - Programmable IEEE 802.1Q tag insertion/removal
 - IEEE 802.1d spanning tree protocol support
 - QoS/CoS Packet prioritization
 - 4 dynamic QoS queues per port
 - Input priority determined by VLAN tag, DA lookup, TOS, DIFFSERV or port default value
 - Programmable class of service map based on input priority
 - Remapping of 802.1Q priority field on per port basis
 - Programmable rate limiting at the ingress/egress ports with random early discard, per port / priority
 - IGMP v1/v2/v3 snooping for Multicast packet filtering
 - IPV6 Multicast Listener Discovery snoop
 - Programmable filter by MAC address

- Switch Management
 - Port mirroring/monitoring/sniffing: ingress and/or egress traffic on any ports or port pairs
 - Fully compliant statistics (MIB) gathering counters
 - Control registers configurable on-the-fly
- Ports
 - 2 internal 10/100 PHYs with HP Auto-MDIX support
 - 1 MII - PHY mode or MAC mode
 - Fully compliant with IEEE 802.3 standards
 - 10BASE-T and 100BASE-TX support
 - Full and half duplex support
 - Full duplex flow control
 - Backpressure (forced collision) half duplex flow control
 - Automatic flow control based on programmable levels
 - Automatic 32-bit CRC generation and checking
 - 2K Jumbo packet support
 - Programmable interframe gap, flow control pause value
 - Full transmit/receive statistics
 - Auto-negotiation
 - Automatic MDI/MDI-X
 - Loop-back mode
- Serial Management
 - SPI/I²C (slave) access to all internal registers
 - MIIM (MDIO) access to PHY related registers
 - SMI (extended MIIM) access to all internal registers
- IEEE 1588 Hardware Time Stamp Unit
 - Global 64-bit tunable clock
 - Master or slave mode per port
 - Time stamp on TX or RX of Sync and Delay_req packets per port, Timestamp on GPIO
 - 64-bit timer comparator event generation (GPIO or IRQ)
- Other Features
 - General Purpose Timer
 - Serial EEPROM interface (I²C master or Microwire™ master) for non-managed configuration
 - Programmable GPIOs/LEDs
- Single 3.3V power supply
- Available in Commercial & Industrial Temp. Ranges

ORDER NUMBERS:

LAN9313-NU FOR 128-PIN, VTQFP LEAD-FREE ROHS COMPLIANT PACKAGE (0 TO 70°C TEMP RANGE)
LAN9313-NZW FOR 128-PIN, XVTQFP LEAD-FREE ROHS COMPLIANT PACKAGE (0 TO 70°C TEMP RANGE)
LAN9313i-NZW FOR 128-PIN, XVTQFP LEAD-FREE ROHS COMPLIANT PACKAGE (-40 TO 85°C TEMP RANGE)

80 ARKAY DRIVE, HAUPPAUGE, NY 11788 (631) 435-6000, FAX (631) 273-3123

Table of Contents

Chapter 1 Preface	14
1.1 General Terms	14
1.2 Buffer Types	16
1.3 Register Nomenclature	17
Chapter 2 Introduction	18
2.1 General Description	18
2.2 Block Diagram	19
2.2.1 System Clocks/Reset/PME Controller	20
2.2.2 System Interrupt Controller	20
2.2.3 Switch Fabric	21
2.2.4 Ethernet PHYs	21
2.2.5 PHY Management Interface (PMI)	21
2.2.6 SPI/I2C Slave Controller	21
2.2.7 SMI Slave Controller	22
2.2.8 EEPROM Controller/Loader	22
2.2.9 1588 Time Stamp	22
2.2.10 GPIO/LED Controller	22
2.3 Modes of Operation	23
2.3.1 MAC Mode	23
2.3.2 PHY Mode	23
2.3.3 Management Modes	23
Chapter 3 Pin Description and Configuration	26
3.1 Pin Diagrams	26
3.1.1 128-VTQFP Pin Diagram	26
3.1.2 128-XVTQFP Pin Diagram	27
3.2 Pin Descriptions	28
Chapter 4 Clocking, Resets, and Power Management	41
4.1 Clocks	41
4.2 Resets	41
4.2.1 Chip-Level Resets	42
4.2.1.1 Power-On Reset (POR)	42
4.2.1.2 nRST Pin Reset	43
4.2.2 Multi-Module Resets	43
4.2.2.1 Digital Reset (DIGITAL_RST)	43
4.2.3 Single-Module Resets	43
4.2.3.1 Port 2 PHY Reset	44
4.2.3.2 Port 1 PHY Reset	44
4.2.3.3 Virtual PHY Reset	44
4.2.4 Configuration Straps	45
4.2.4.1 Soft-Straps	45
4.2.4.2 Hard-Straps	50
4.3 Power Management	51
4.3.1 Port 1 & 2 PHY Power Management	51
Chapter 5 System Interrupts	52
5.1 Functional Overview	52
5.2 Interrupt Sources	52
5.2.1 1588 Time Stamp Interrupts	54
5.2.2 Switch Fabric Interrupts	54
5.2.3 Ethernet PHY Interrupts	55
5.2.4 GPIO Interrupts	55

5.2.5	General Purpose Timer Interrupt	55
5.2.6	Software Interrupt	56
5.2.7	Device Ready Interrupt	56

Chapter 6 Switch Fabric **57**

6.1	Functional Overview	57
6.2	Switch Fabric CSRs	57
6.2.1	Switch Fabric CSR Writes	58
6.2.2	Switch Fabric CSR Reads	59
6.2.3	Flow Control Enable Logic	60
6.3	10/100 Ethernet MACs	62
6.3.1	Receive MAC	62
6.3.1.1	Receive Counters	63
6.3.2	Transmit MAC	64
6.3.2.1	Transmit Counters	64
6.4	Switch Engine (SWE)	65
6.4.1	MAC Address Lookup Table	65
6.4.1.1	Learning/Aging/Migration	66
6.4.1.2	Static Entries	66
6.4.1.3	Multicast Pruning	66
6.4.1.4	Address Filtering	66
6.4.1.5	Spanning Tree Port State Override	66
6.4.1.6	MAC Destination Address Lookup Priority	66
6.4.1.7	Host Access	66
6.4.2	Forwarding Rules	68
6.4.3	Transmit Priority Queue Selection	69
6.4.3.1	Port Default Priority	71
6.4.3.2	IP Precedence Based Priority	71
6.4.3.3	DIFFSERV Based Priority	71
6.4.3.4	VLAN Priority	71
6.4.4	VLAN Support	72
6.4.5	Spanning Tree Support	72
6.4.6	Ingress Flow Metering and Coloring	73
6.4.6.1	Ingress Flow Calculation	74
6.4.7	Broadcast Storm Control	76
6.4.8	IPv4 IGMP / IPv6 MLD Support	76
6.4.9	Port Mirroring	77
6.4.10	Host CPU Port Special Tagging	77
6.4.10.1	Packets from the Host CPU	77
6.4.10.2	Packets to the Host CPU	78
6.4.11	Counters	78
6.5	Buffer Manager (BM)	78
6.5.1	Packet Buffer Allocation	78
6.5.1.1	Buffer Limits and Flow Control Levels	79
6.5.2	Random Early Discard (RED)	79
6.5.3	Transmit Queues	79
6.5.4	Transmit Priority Queue Servicing	79
6.5.5	Egress Rate Limiting (Leaky Bucket)	80
6.5.6	Adding, Removing, and Changing VLAN Tags	80
6.5.7	Counters	83
6.6	Switch Fabric Interrupts	83

Chapter 7 Ethernet PHYs **84**

7.1	Functional Overview	84
7.1.1	PHY Addressing	84
7.2	Port 1 & 2 PHYs	85
7.2.1	100BASE-TX Transmit	86
7.2.1.1	MII MAC Interface	86
7.2.1.2	4B/5B Encoder	86
7.2.1.3	Scrambler and PISO	88
7.2.1.4	NRZI and MLT-3 Encoding	88
7.2.1.5	100M Transmit Driver	88

Datasheet

7.2.1.6	100M Phase Lock Loop (PLL)	88
7.2.2	100BASE-TX Receive	89
7.2.2.1	A/D Converter	89
7.2.2.2	DSP: Equalizer, BLW Correction and Clock/Data Recovery	89
7.2.2.3	NRZI and MLT-3 Decoding	90
7.2.2.4	Descrambler and SIPO	90
7.2.2.5	5B/4B Decoding	90
7.2.2.6	Receiver Errors	90
7.2.2.7	MII MAC Interface	90
7.2.3	10BASE-T Transmit	91
7.2.3.1	MII MAC Interface	91
7.2.3.2	10M TX Driver and PLL	91
7.2.4	10BASE-T Receive	91
7.2.4.1	Filter and Squelch	91
7.2.4.2	10M RX and PLL	91
7.2.4.3	MII MAC Interface	92
7.2.4.4	Jabber Detection	92
7.2.5	PHY Auto-negotiation	92
7.2.5.1	PHY Pause Flow Control	94
7.2.5.2	Parallel Detection	94
7.2.5.3	Restarting Auto-Negotiation	94
7.2.5.4	Disabling Auto-Negotiation	94
7.2.5.5	Half Vs. Full-Duplex	95
7.2.6	HP Auto-MDIX	95
7.2.7	MII MAC Interface	95
7.2.8	PHY Management Control	96
7.2.8.1	PHY Interrupts	96
7.2.9	PHY Power-Down Modes	96
7.2.9.1	PHY General Power-Down	97
7.2.9.2	PHY Energy Detect Power-Down	97
7.2.10	PHY Resets	97
7.2.10.1	PHY Software Reset via RESET_CTL	97
7.2.10.2	PHY Software Reset via PHY_BASIC_CTRL_x	97
7.2.10.3	PHY Power-Down Reset	97
7.2.11	LEDs	98
7.2.12	Required Ethernet Magnetics	98
7.3	Virtual PHY	98
7.3.1	Virtual PHY Auto-Negotiation	98
7.3.1.1	Parallel Detection	99
7.3.1.2	Disabling Auto-Negotiation	99
7.3.1.3	Virtual PHY Pause Flow Control	99
7.3.2	Virtual PHY in MAC Modes	100
7.3.2.1	Full-Duplex Flow Control	100
7.3.3	Virtual PHY Resets	100
7.3.3.1	Virtual PHY Software Reset via RESET_CTL	100
7.3.3.2	Virtual PHY Software Reset via VPHY_BASIC_CTRL	100

Chapter 8 Serial Management **101**

8.1	Functional Overview	101
8.2	I2C/Microwire Master EEPROM Controller	101
8.2.1	EEPROM Controller Operation	102
8.2.2	I2C EEPROM	103
8.2.2.1	I2C Protocol Overview	104
8.2.2.2	I2C EEPROM Device Addressing	105
8.2.2.3	I2C EEPROM Byte Read	106
8.2.2.4	I2C EEPROM Sequential Byte Reads	106
8.2.2.5	I2C EEPROM Byte Writes	107
8.2.3	Microwire EEPROM	108
8.2.3.1	Microwire Master Commands	108
8.2.3.2	ERASE (Erase Location)	109
8.2.3.3	ERAL (Erase All)	110
8.2.3.4	EWDS (Erase/Write Disable)	110
8.2.3.5	EWEN (Erase/Write Enable)	111
8.2.3.6	READ (Read Location)	111
8.2.3.7	WRITE (Write Location)	112
8.2.3.8	WRAL (Write All)	112
8.2.4	EEPROM Loader	113
8.2.4.1	EEPROM Loader Operation	113
8.2.4.2	EEPROM Valid Flag	115
8.2.4.3	MAC Address	115
8.2.4.4	Soft-Straps	115

8.2.4.4.1	PHY Registers Synchronization	115
8.2.4.4.2	Virtual PHY Registers Synchronization	116
8.2.4.4.3	LED and Manual Flow Control Register Synchronization	116
8.2.4.5	Register Data	116
8.2.4.6	EEPROM Loader Finished Wait-State	117
8.2.4.7	Reset Sequence and EEPROM Loader	117
8.3	SPI/I2C Slave Controller	118
8.4	SPI Slave Operation	118
8.4.1	SPI Read Sequence	119
8.4.1.1	SPI Read Polling for Reset Complete	120
8.4.2	SPI Write Sequence	120
8.5	I2C Slave Operation	121
8.5.1	I2C Slave Command Format	121
8.5.2	I2C Slave Read Sequence	122
8.5.2.1	I2C Slave Read Polling for Reset Complete	123
8.5.3	I2C Slave Write Sequence	123

Chapter 9 MII Management **125**

9.1	Functional Overview	125
9.2	SMI Slave Controller	125
9.2.1	Read Sequence	126
9.2.1.1	SMI Read Polling for Reset Complete	126
9.2.2	Write Sequence	127
9.3	PHY Management Interface (PMI)	127
9.3.1	EEPROM Loader PHY Register Access	127
9.4	MII Mode Multiplexer	128
9.4.1	MAC Mode Unmanaged	128
9.4.2	MAC Mode SMI Managed	129
9.4.3	MAC Mode I2C/SPI Managed	130
9.4.4	PHY Mode Unmanaged	131
9.4.5	PHY Mode SMI Managed	132
9.4.6	PHY Mode I2C/SPI Managed	133

Chapter 10 IEEE 1588 Hardware Time Stamp Unit **134**

10.1	Functional Overview	134
10.1.1	IEEE 1588	134
10.1.2	Block Diagram	135
10.2	IEEE 1588 Time Stamp	136
10.2.1	Capture Locking	137
10.2.2	PTP Message Detection	138
10.3	IEEE 1588 Clock	139
10.4	IEEE 1588 Clock/Events	140
10.5	IEEE 1588 GPIOs	140
10.6	IEEE 1588 Interrupts	140

Chapter 11 General Purpose Timer & Free-Running Clock **141**

11.1	General Purpose Timer	141
11.2	Free-Running Clock	141

Chapter 12 GPIO/LED Controller **142**

12.1	Functional Overview	142
12.2	GPIO Operation	142
12.2.1	GPIO IEEE 1588 Timestamping	143
12.2.1.1	IEEE 1588 GPIO Inputs	143
12.2.1.2	IEEE 1588 GPIO Outputs	143
12.2.2	GPIO Interrupts	143
12.2.2.1	GPIO Interrupt Polarity	143

Datasheet

12.2.2.2	IEEE 1588 GPIO Interrupts.....	144
12.3	LED Operation	144

Chapter 13 Register Descriptions..... 146

13.1	System Control and Status Registers.....	147
13.1.1	Interrupts	151
13.1.1.1	Interrupt Configuration Register (IRQ_CFG).....	151
13.1.1.2	Interrupt Status Register (INT_STS).....	153
13.1.1.3	Interrupt Enable Register (INT_EN).....	154
13.1.2	GPIO/LED.....	155
13.1.2.1	General Purpose I/O Configuration Register (GPIO_CFG).....	155
13.1.2.2	General Purpose I/O Data & Direction Register (GPIO_DATA_DIR).....	157
13.1.2.3	General Purpose I/O Interrupt Status and Enable Register (GPIO_INT_STS_EN).....	158
13.1.2.4	LED Configuration Register (LED_CFG).....	159
13.1.3	EEPROM	160
13.1.3.1	EEPROM Command Register (E2P_CMD).....	160
13.1.3.2	EEPROM Data Register (E2P_DATA).....	163
13.1.4	IEEE 1588	164
13.1.4.1	Port x 1588 Clock High-DWORD Receive Capture Register (1588_CLOCK_HI_RX_CAPTURE_x).....	164
13.1.4.2	Port x 1588 Clock Low-DWORD Receive Capture Register (1588_CLOCK_LO_RX_CAPTURE_x).....	165
13.1.4.3	Port x 1588 Sequence ID, Source UUID High-WORD Receive Capture Register (1588_SEQ_ID_SRC_UUID_HI_RX_CAPTURE_x).....	166
13.1.4.4	Port x 1588 Source UUID Low-DWORD Receive Capture Register (1588_SRC_UUID_LO_RX_CAPTURE_x).....	167
13.1.4.5	Port x 1588 Clock High-DWORD Transmit Capture Register (1588_CLOCK_HI_TX_CAPTURE_x).....	168
13.1.4.6	Port x 1588 Clock Low-DWORD Transmit Capture Register (1588_CLOCK_LO_TX_CAPTURE_x).....	169
13.1.4.7	Port x 1588 Sequence ID, Source UUID High-WORD Transmit Capture Register (1588_SEQ_ID_SRC_UUID_HI_TX_CAPTURE_x).....	170
13.1.4.8	Port x 1588 Source UUID Low-DWORD Transmit Capture Register (1588_SRC_UUID_LO_TX_CAPTURE_x).....	171
13.1.4.9	GPIO 8 1588 Clock High-DWORD Capture Register (1588_CLOCK_HI_CAPTURE_GPIO_8).....	172
13.1.4.10	GPIO 8 1588 Clock Low-DWORD Capture Register (1588_CLOCK_LO_CAPTURE_GPIO_8).....	173
13.1.4.11	GPIO 9 1588 Clock High-DWORD Capture Register (1588_CLOCK_HI_CAPTURE_GPIO_9).....	174
13.1.4.12	GPIO 9 1588 Clock Low-DWORD Capture Register (1588_CLOCK_LO_CAPTURE_GPIO_9).....	175
13.1.4.13	1588 Clock High-DWORD Register (1588_CLOCK_HI).....	176
13.1.4.14	1588 Clock Low-DWORD Register (1588_CLOCK_LO).....	177
13.1.4.15	1588 Clock Addend Register (1588_CLOCK_ADDEND).....	178
13.1.4.16	1588 Clock Target High-DWORD Register (1588_CLOCK_TARGET_HI).....	179
13.1.4.17	1588 Clock Target Low-DWORD Register (1588_CLOCK_TARGET_LO).....	180
13.1.4.18	1588 Clock Target Reload High-DWORD Register (1588_CLOCK_TARGET_RELOAD_HI).....	181
13.1.4.19	1588 Clock Target Reload/Add Low-DWORD Register (1588_CLOCK_TARGET_RELOAD_LO).....	182
13.1.4.20	1588 Auxiliary MAC Address High-WORD Register (1588_AUX_MAC_HI).....	183
13.1.4.21	1588 Auxiliary MAC Address Low-DWORD Register (1588_AUX_MAC_LO).....	184
13.1.4.22	1588 Configuration Register (1588_CONFIG).....	185
13.1.4.23	1588 Interrupt Status and Enable Register (1588_INT_STS_EN).....	189
13.1.4.24	1588 Command Register (1588_CMD).....	191
13.1.5	Switch Fabric	192
13.1.5.1	Port 1 Manual Flow Control Register (MANUAL_FC_1).....	192
13.1.5.2	Port 2 Manual Flow Control Register (MANUAL_FC_2).....	194
13.1.5.3	Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII).....	196
13.1.5.4	Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA).....	198
13.1.5.5	Switch Fabric CSR Interface Command Register (SWITCH_CSR_CMD).....	199
13.1.5.6	Switch Fabric MAC Address High Register (SWITCH_MAC_ADDRH).....	201
13.1.5.7	Switch Fabric MAC Address Low Register (SWITCH_MAC_ADDRL).....	202
13.1.5.8	Switch Fabric CSR Interface Direct Data Register (SWITCH_CSR_DIRECT_DATA).....	204
13.1.6	PHY Management Interface (PMI).....	207
13.1.6.1	PHY Management Interface Data Register (PMI_DATA).....	207
13.1.6.2	PHY Management Interface Access Register (PMI_ACCESS).....	208
13.1.7	Virtual PHY	209
13.1.7.1	Virtual PHY Basic Control Register (VPHY_BASIC_CTRL).....	210
13.1.7.2	Virtual PHY Basic Status Register (VPHY_BASIC_STATUS).....	212
13.1.7.3	Virtual PHY Identification MSB Register (VPHY_ID_MSB).....	214
13.1.7.4	Virtual PHY Identification LSB Register (VPHY_ID_LSB).....	215
13.1.7.5	Virtual PHY Auto-Negotiation Advertisement Register (VPHY_AN_ADV).....	216
13.1.7.6	Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register (VPHY_AN_LP_BASE_ABILITY).....	218
13.1.7.7	Virtual PHY Auto-Negotiation Expansion Register (VPHY_AN_EXP).....	221
13.1.7.8	Virtual PHY Special Control/Status Register (VPHY_SPECIAL_CONTROL_STATUS).....	222
13.1.8	Miscellaneous	224
13.1.8.1	Chip ID and Revision (ID_REV).....	224
13.1.8.2	Byte Order Test Register (BYTE_TEST).....	225
13.1.8.3	Hardware Configuration Register (HW_CFG).....	226
13.1.8.4	General Purpose Timer Configuration Register (GPT_CFG).....	227
13.1.8.5	General Purpose Timer Count Register (GPT_CNT).....	228
13.1.8.6	Free Running 25MHz Counter Register (FREE_RUN).....	229
13.1.8.7	Reset Control Register (RESET_CTL).....	230
13.2	Ethernet PHY Control and Status Registers.....	231
13.2.1	Virtual PHY Registers.....	231
13.2.2	Port 1 & 2 PHY Registers.....	231
13.2.2.1	Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x).....	233

13.2.2.2	Port x PHY Basic Status Register (PHY_BASIC_STATUS_x)	235
13.2.2.3	Port x PHY Identification MSB Register (PHY_ID_MSB_x)	237
13.2.2.4	Port x PHY Identification LSB Register (PHY_ID_LSB_x)	238
13.2.2.5	Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x)	239
13.2.2.6	Port x PHY Auto-Negotiation Link Partner Base Page Ability Register (PHY_AN_LP_BASE_ABILITY_x)	242
13.2.2.7	Port x PHY Auto-Negotiation Expansion Register (PHY_AN_EXP_x)	244
13.2.2.8	Port x PHY Mode Control/Status Register (PHY_MODE_CONTROL_STATUS_x)	245
13.2.2.9	Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x)	246
13.2.2.10	Port x PHY Special Control/Status Indication Register (PHY_SPECIAL_CONTROL_STAT_IND_x)	248
13.2.2.11	Port x PHY Interrupt Source Flags Register (PHY_INTERRUPT_SOURCE_x)	250
13.2.2.12	Port x PHY Interrupt Mask Register (PHY_INTERRUPT_MASK_x)	251
13.2.2.13	Port x PHY Special Control/Status Register (PHY_SPECIAL_CONTROL_STATUS_x)	252
13.3	Switch Fabric Control and Status Registers	253
13.3.1	General Switch CSRs	264
13.3.1.1	Switch Device ID Register (SW_DEV_ID)	264
13.3.1.2	Switch Reset Register (SW_RESET)	265
13.3.1.3	Switch Global Interrupt Mask Register (SW_IMR)	266
13.3.1.4	Switch Global Interrupt Pending Register (SW_IPR)	267
13.3.2	Switch Port 0, Port 1, and Port 2 CSRs	268
13.3.2.1	Port x MAC Version ID Register (MAC_VER_ID_x)	268
13.3.2.2	Port x MAC Receive Configuration Register (MAC_RX_CFG_x)	269
13.3.2.3	Port x MAC Receive Undersize Count Register (MAC_RX_UNDSZE_CNT_x)	270
13.3.2.4	Port x MAC Receive 64 Byte Count Register (MAC_RX_64_CNT_x)	271
13.3.2.5	Port x MAC Receive 65 to 127 Byte Count Register (MAC_RX_65_TO_127_CNT_x)	272
13.3.2.6	Port x MAC Receive 128 to 255 Byte Count Register (MAC_RX_128_TO_255_CNT_x)	273
13.3.2.7	Port x MAC Receive 256 to 511 Byte Count Register (MAC_RX_256_TO_511_CNT_x)	274
13.3.2.8	Port x MAC Receive 512 to 1023 Byte Count Register (MAC_RX_512_TO_1023_CNT_x)	275
13.3.2.9	Port x MAC Receive 1024 to Max Byte Count Register (MAC_RX_1024_TO_MAX_CNT_x)	276
13.3.2.10	Port x MAC Receive Oversize Count Register (MAC_RX_OVRSZE_CNT_x)	277
13.3.2.11	Port x MAC Receive OK Count Register (MAC_RX_PKTOK_CNT_x)	278
13.3.2.12	Port x MAC Receive CRC Error Count Register (MAC_RX_CRCERR_CNT_x)	279
13.3.2.13	Port x MAC Receive Multicast Count Register (MAC_RX_MULCST_CNT_x)	280
13.3.2.14	Port x MAC Receive Broadcast Count Register (MAC_RX_BRDCST_CNT_x)	281
13.3.2.15	Port x MAC Receive Pause Frame Count Register (MAC_RX_PAUSE_CNT_x)	282
13.3.2.16	Port x MAC Receive Fragment Error Count Register (MAC_RX_FRAG_CNT_x)	283
13.3.2.17	Port x MAC Receive Jabber Error Count Register (MAC_RX_JABB_CNT_x)	284
13.3.2.18	Port x MAC Receive Alignment Error Count Register (MAC_RX_ALIGN_CNT_x)	285
13.3.2.19	Port x MAC Receive Packet Length Count Register (MAC_RX_PKTLEN_CNT_x)	286
13.3.2.20	Port x MAC Receive Good Packet Length Count Register (MAC_RX_GOODPKTLEN_CNT_x)	287
13.3.2.21	Port x MAC Receive Symbol Error Count Register (MAC_RX_SYMBOL_CNT_x)	288
13.3.2.22	Port x MAC Receive Control Frame Count Register (MAC_RX_CTLFRM_CNT_x)	289
13.3.2.23	Port x MAC Transmit Configuration Register (MAC_TX_CFG_x)	290
13.3.2.24	Port x MAC Transmit Flow Control Settings Register (MAC_TX_FC_SETTINGS_x)	291
13.3.2.25	Port x MAC Transmit Deferred Count Register (MAC_TX_DEFER_CNT_x)	292
13.3.2.26	Port x MAC Transmit Pause Count Register (MAC_TX_PAUSE_CNT_x)	293
13.3.2.27	Port x MAC Transmit OK Count Register (MAC_TX_PKTOK_CNT_x)	294
13.3.2.28	Port x MAC Transmit 64 Byte Count Register (MAC_TX_64_CNT_x)	295
13.3.2.29	Port x MAC Transmit 65 to 127 Byte Count Register (MAC_TX_65_TO_127_CNT_x)	296
13.3.2.30	Port x MAC Transmit 128 to 255 Byte Count Register (MAC_TX_128_TO_255_CNT_x)	297
13.3.2.31	Port x MAC Transmit 256 to 511 Byte Count Register (MAC_TX_256_TO_511_CNT_x)	298
13.3.2.32	Port x MAC Transmit 512 to 1023 Byte Count Register (MAC_TX_512_TO_1023_CNT_x)	299
13.3.2.33	Port x MAC Transmit 1024 to Max Byte Count Register (MAC_TX_1024_TO_MAX_CNT_x)	300
13.3.2.34	Port x MAC Transmit Undersize Count Register (MAC_TX_UNDSZE_CNT_x)	301
13.3.2.35	Port x MAC Transmit Packet Length Count Register (MAC_TX_PKTLEN_CNT_x)	302
13.3.2.36	Port x MAC Transmit Broadcast Count Register (MAC_TX_BRDCST_CNT_x)	303
13.3.2.37	Port x MAC Transmit Multicast Count Register (MAC_TX_MULCST_CNT_x)	304
13.3.2.38	Port x MAC Transmit Late Collision Count Register (MAC_TX_LATECOL_CNT_x)	305
13.3.2.39	Port x MAC Transmit Excessive Collision Count Register (MAC_TX_EXCCOL_CNT_x)	306
13.3.2.40	Port x MAC Transmit Single Collision Count Register (MAC_TX_SNGLECOL_CNT_x)	307
13.3.2.41	Port x MAC Transmit Multiple Collision Count Register (MAC_TX_MULTICOL_CNT_x)	308
13.3.2.42	Port x MAC Transmit Total Collision Count Register (MAC_TX_TOTALCOL_CNT_x)	309
13.3.2.43	Port x MAC Interrupt Mask Register (MAC_IMR_x)	310
13.3.2.44	Port x MAC Interrupt Pending Register (MAC_IPR_x)	311
13.3.3	Switch Engine CSRs	312
13.3.3.1	Switch Engine ALR Command Register (SWE_ALR_CMD)	312
13.3.3.2	Switch Engine ALR Write Data 0 Register (SWE_ALR_WR_DAT_0)	313
13.3.3.3	Switch Engine ALR Write Data 1 Register (SWE_ALR_WR_DAT_1)	314
13.3.3.4	Switch Engine ALR Read Data 0 Register (SWE_ALR_RD_DAT_0)	316
13.3.3.5	Switch Engine ALR Read Data 1 Register (SWE_ALR_RD_DAT_1)	317
13.3.3.6	Switch Engine ALR Command Status Register (SWE_ALR_CMD_STS)	319
13.3.3.7	Switch Engine ALR Configuration Register (SWE_ALR_CFG)	320
13.3.3.8	Switch Engine VLAN Command Register (SWE_VLAN_CMD)	321
13.3.3.9	Switch Engine VLAN Write Data Register (SWE_VLAN_WR_DATA)	322
13.3.3.10	Switch Engine VLAN Read Data Register (SWE_VLAN_RD_DATA)	323
13.3.3.11	Switch Engine VLAN Command Status Register (SWE_VLAN_CMD_STS)	324
13.3.3.12	Switch Engine DIFFSERV Table Command Register (SWE_DIFFSERV_TBL_CFG)	325
13.3.3.13	Switch Engine DIFFSERV Table Write Data Register (SWE_DIFFSERV_TBL_WR_DATA)	326
13.3.3.14	Switch Engine DIFFSERV Table Read Data Register (SWE_DIFFSERV_TBL_RD_DATA)	327
13.3.3.15	Switch Engine DIFFSERV Table Command Status Register (SWE_DIFFSERV_TBL_CMD_STS)	328
13.3.3.16	Switch Engine Global Ingress Configuration Register (SWE_GLOBAL INGRSS_CFG)	329

Datasheet

13.3.3.17	Switch Engine Port Ingress Configuration Register (SWE_PORT_INGRSS_CFG)	331
13.3.3.18	Switch Engine Admit Only VLAN Register (SWE_ADMT_ONLY_VLAN)	332
13.3.3.19	Switch Engine Port State Register (SWE_PORT_STATE)	333
13.3.3.20	Switch Engine Priority to Queue Register (SWE_PRI_TO_QUEUE)	334
13.3.3.21	Switch Engine Port Mirroring Register (SWE_PORT_MIRROR)	335
13.3.3.22	Switch Engine Ingress Port Type Register (SWE_INGRSS_PORT_TYP)	336
13.3.3.23	Switch Engine Broadcast Throttling Register (SWE_BCST_THROT)	337
13.3.3.24	Switch Engine Admit Non Member Register (SWE_ADMT_N_MEMBER)	338
13.3.3.25	Switch Engine Ingress Rate Configuration Register (SWE_INGRSS_RATE_CFG)	339
13.3.3.26	Switch Engine Ingress Rate Command Register (SWE_INGRSS_RATE_CMD)	340
13.3.3.26.1	Ingress Rate Table Registers	341
13.3.3.27	Switch Engine Ingress Rate Command Status Register (SWE_INGRSS_RATE_CMD_STS)	342
13.3.3.28	Switch Engine Ingress Rate Write Data Register (SWE_INGRSS_RATE_WR_DATA)	343
13.3.3.29	Switch Engine Ingress Rate Read Data Register (SWE_INGRSS_RATE_RD_DATA)	344
13.3.3.30	Switch Engine Port 0 Ingress Filtered Count Register (SWE_FILTERED_CNT_MII)	345
13.3.3.31	Switch Engine Port 1 Ingress Filtered Count Register (SWE_FILTERED_CNT_1)	346
13.3.3.32	Switch Engine Port 2 Ingress Filtered Count Register (SWE_FILTERED_CNT_2)	347
13.3.3.33	Switch Engine Port 0 Ingress VLAN Priority Regeneration Table Register (SWE_INGRSS_REGEN_TBL_MII)	348
13.3.3.34	Switch Engine Port 1 Ingress VLAN Priority Regeneration Table Register (SWE_INGRSS_REGEN_TBL_1)	349
13.3.3.35	Switch Engine Port 2 Ingress VLAN Priority Regeneration Table Register (SWE_INGRSS_REGEN_TBL_2)	350
13.3.3.36	Switch Engine Port 0 Learn Discard Count Register (SWE_LRN_DISCRD_CNT_MII)	351
13.3.3.37	Switch Engine Port 1 Learn Discard Count Register (SWE_LRN_DISCRD_CNT_1)	352
13.3.3.38	Switch Engine Port 2 Learn Discard Count Register (SWE_LRN_DISCRD_CNT_2)	353
13.3.3.39	Switch Engine Interrupt Mask Register (SWE_IMR)	354
13.3.3.40	Switch Engine Interrupt Pending Register (SWE_IPR)	355
13.3.4	Buffer Manager CSRs	357
13.3.4.1	Buffer Manager Configuration Register (BM_CFG)	357
13.3.4.2	Buffer Manager Drop Level Register (BM_DROP_LVL)	358
13.3.4.3	Buffer Manager Flow Control Pause Level Register (BM_FC_PAUSE_LVL)	359
13.3.4.4	Buffer Manager Flow Control Resume Level Register (BM_FC_RESUME_LVL)	360
13.3.4.5	Buffer Manager Broadcast Buffer Level Register (BM_BCST_LVL)	361
13.3.4.6	Buffer Manager Port 0 Drop Count Register (BM_DRP_CNT_SRC_MII)	362
13.3.4.7	Buffer Manager Port 1 Drop Count Register (BM_DRP_CNT_SRC_1)	363
13.3.4.8	Buffer Manager Port 2 Drop Count Register (BM_DRP_CNT_SRC_2)	364
13.3.4.9	Buffer Manager Reset Status Register (BM_RST_STS)	365
13.3.4.10	Buffer Manager Random Discard Table Command Register (BM_RNDM_DSCRD_TBL_CMD)	366
13.3.4.11	Buffer Manager Random Discard Table Write Data Register (BM_RNDM_DSCRD_TBL_WDATA)	367
13.3.4.12	Buffer Manager Random Discard Table Read Data Register (BM_RNDM_DSCRD_TBL_RDATA)	368
13.3.4.13	Buffer Manager Egress Port Type Register (BM_EGRSS_PORT_TYPE)	369
13.3.4.14	Buffer Manager Port 0 Egress Rate Priority Queue 0/1 Register (BM_EGRSS_RATE_00_01)	371
13.3.4.15	Buffer Manager Port 0 Egress Rate Priority Queue 2/3 Register (BM_EGRSS_RATE_02_03)	372
13.3.4.16	Buffer Manager Port 1 Egress Rate Priority Queue 0/1 Register (BM_EGRSS_RATE_10_11)	373
13.3.4.17	Buffer Manager Port 1 Egress Rate Priority Queue 2/3 Register (BM_EGRSS_RATE_12_13)	374
13.3.4.18	Buffer Manager Port 2 Egress Rate Priority Queue 0/1 Register (BM_EGRSS_RATE_20_21)	375
13.3.4.19	Buffer Manager Port 2 Egress Rate Priority Queue 2/3 Register (BM_EGRSS_RATE_22_23)	376
13.3.4.20	Buffer Manager Port 0 Default VLAN ID and Priority Register (BM_VLAN_MII)	377
13.3.4.21	Buffer Manager Port 1 Default VLAN ID and Priority Register (BM_VLAN_1)	378
13.3.4.22	Buffer Manager Port 2 Default VLAN ID and Priority Register (BM_VLAN_2)	379
13.3.4.23	Buffer Manager Port 0 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_MII)	380
13.3.4.24	Buffer Manager Port 1 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_1)	381
13.3.4.25	Buffer Manager Port 2 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_2)	382
13.3.4.26	Buffer Manager Interrupt Mask Register (BM_IMR)	383
13.3.4.27	Buffer Manager Interrupt Pending Register (BM_IPR)	384

Chapter 14 Operational Characteristics **386**

14.1	Absolute Maximum Ratings*	386
14.2	Operating Conditions**	386
14.3	Power Consumption	387

Chapter 1 Preface

1.1 General Terms

100BT	100BASE-T (100Mbps Fast Ethernet, IEEE 802.3u)
ADC	Analog-to-Digital Converter
ALR	Address Logic Resolution
BLW	Baseline Wander
BM	Buffer Manager - Part of the switch fabric
BPDU	Bridge Protocol Data Unit - Messages which carry the Spanning Tree Protocol information
Byte	8-bits
CSMA/CD	Carrier Sense Multiple Access / Collision Detect
CSR	Control and Status Registers
CTR	Counter
DA	Destination Address
DWORD	32-bits
EPC	EEPROM Controller
FCS	Frame Check Sequence - The extra checksum characters added to the end of an Ethernet frame, used for error detection and correction.
FIFO	First In First Out buffer
FSM	Finite State Machine
GPIO	General Purpose I/O
Host	External system (Includes processor, application software, etc.)
IGMP	Internet Group Management Protocol
Inbound	Refers to data input to the LAN9313/LAN9313i from the host
Level-Triggered Sticky Bit	This type of status bit is set whenever the condition that it represents is asserted. The bit remains set until the condition is no longer true, and the status bit is cleared by writing a zero.
lsb	Least Significant Bit
LSB	Least Significant Byte
MDI	Medium Dependant Interface
MDIX	Media Independent Interface with Crossover
MII	Media Independent Interface
MIIM	Media Independent Interface Management
MIL	MAC Interface Layer

Datasheet

MLD	Multicast Listening Discovery
MLT-3	Multi-Level Transmission Encoding (3-Levels). A tri-level encoding method where a change in the logic level represents a code bit "1" and the logic output remaining at the same level represents a code bit "0".
msb	Most Significant Bit
MSB	Most Significant Byte
NRZI	Non Return to Zero Inverted. This encoding method inverts the signal for a "1" and leaves the signal unchanged for a "0"
N/A	Not Applicable
NC	No Connect
OUI	Organizationally Unique Identifier
Outbound	Refers to data output from the LAN9313/LAN9313i to the host
PIO cycle	Program I/O cycle. An SRAM-like read or write cycle on the HBI.
PISO	Parallel In Serial Out
PLL	Phase Locked Loop
PTP	Precision Time Protocol
RESERVED	Refers to a reserved bit field or address. Unless otherwise noted, reserved bits must always be zero for write operations. Unless otherwise noted, values are not guaranteed when reading reserved bits. Unless otherwise noted, do not read or write to reserved addresses.
RTC	Real-Time Clock
SA	Source Address
SFD	Start of Frame Delimiter - The 8-bit value indicating the end of the preamble of an Ethernet frame.
SIPO	Serial In Parallel Out
SMI	Serial Management Interface
SQE	Signal Quality Error (also known as "heartbeat")
SSD	Start of Stream Delimiter
UDP	User Datagram Protocol - A connectionless protocol run on top of IP networks
UUID	Universally Unique IDentifier
WORD	16-bits

1.2 Buffer Types

Table 1.1 describes the pin buffer type notation used in Chapter 3, "Pin Description and Configuration," on page 26 and throughout this document.

Table 1.1 Buffer Types

BUFFER TYPE	DESCRIPTION
IS	Schmitt-triggered Input
O8	Output with 8mA sink and 8mA source
OD8	Open-drain output with 8mA sink
O12	Output with 12mA sink and 12mA source
OD12	Open-drain output with 12mA sink
PU	50uA (typical) internal pull-up. Unless otherwise noted in the pin description, internal pull-ups are always enabled. Note: Internal pull-up resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the LAN9313/LAN9313i. When connected to a load that must be pulled high, an external resistor must be added.
PD	50uA (typical) internal pull-down. Unless otherwise noted in the pin description, internal pull-downs are always enabled. Note: Internal pull-down resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the LAN9313/LAN9313i. When connected to a load that must be pulled low, an external resistor must be added.
AI	Analog input
AO	Analog output
AIO	Analog bi-directional
ICLK	Crystal oscillator input pin
OCLK	Crystal oscillator output pin
P	Power pin

1.3 Register Nomenclature

Table 1.2 describes the register bit attribute notation used throughout this document.

Table 1.2 Register Bit Types

REGISTER BIT TYPE NOTATION	REGISTER BIT DESCRIPTION
R	Read: A register or bit with this attribute can be read.
W	Read: A register or bit with this attribute can be written.
RO	Read only: Read only. Writes have no effect.
WO	Write only: If a register or bit is write-only, reads will return unspecified data.
WC	Write One to Clear: writing a one clears the value. Writing a zero has no effect
WAC	Write Anything to Clear: writing anything clears the value.
RC	Read to Clear: Contents is cleared after the read. Writes have no effect.
LL	Latch Low: Clear on read of register.
LH	Latch High: Clear on read of register.
SC	Self-Clearing: Contents are self-cleared after the being set. Writes of zero have no effect. Contents can be read.
SS	Self-Setting: Contents are self-setting after being cleared. Writes of one have no effect. Contents can be read.
RO/LH	Read Only, Latch High: Bits with this attribute will stay high until the bit is read. After it is read, the bit will either remain high if the high condition remains, or will go low if the high condition has been removed. If the bit has not been read, the bit will remain high regardless of a change to the high condition. This mode is used in some Ethernet PHY registers.
NASR	Not Affected by Software Reset. The state of NASR bits do not change on assertion of a software reset.
RESERVED	Reserved Field: Reserved fields must be written with zeros to ensure future compatibility. The value of reserved bits is not guaranteed on a read.

Many of these register bit notations can be combined. Some examples of this are shown below:

- **R/W:** Can be written. Will return current setting on a read.
- **R/WAC:** Will return current setting on a read. Writing anything clears the bit.

Chapter 2 Introduction

2.1 General Description

The LAN9313/LAN9313i is a full featured, 3 port 10/100 managed Ethernet switch designed for embedded applications where performance, flexibility, ease of integration and system cost control are required. The LAN9313/LAN9313i combines all the functions of a 10/100 switch system, including the switch fabric, packet buffers, buffer manager, media access controllers (MACs), PHY transceivers, and serial management. The LAN9313/LAN9313i complies with the IEEE 802.3 (full/half-duplex 10BASE-T and 100BASE-TX) Ethernet protocol specification and 802.1D/802.1Q network management protocol specifications, enabling compatibility with industry standard Ethernet and Fast Ethernet applications.

At the core of the LAN9313/LAN9313i is the high performance, high efficiency 3 port Ethernet switch fabric. The switch fabric contains a 3 port VLAN layer 2 switch engine that supports untagged, VLAN tagged, and priority tagged frames. The switch fabric provides an extensive feature set which includes spanning tree protocol support, multicast packet filtering and Quality of Service (QoS) packet prioritization by VLAN tag, destination address, port default value or DIFFSERV/TOS, allowing for a range of prioritization implementations. 32K of buffer RAM allows for the storage of multiple packets while forwarding operations are completed, and a 1K entry forwarding table provides ample room for MAC address forwarding tables. Each port is allocated a cluster of 4 dynamic QoS queues which allow each queue size to grow and shrink with traffic, effectively utilizing all available memory. This memory is managed dynamically via the buffer manager block within the switch fabric. All aspects of the switch fabric are managed via the switch fabric configuration and status registers, which are indirectly accessible via the system control and status registers.

The LAN9313/LAN9313i provides 3 switched ports. Each port is fully compliant with the IEEE 802.3 standard and all internal MACs and PHYs support full/half duplex 10BASE-T and 100BASE-TX operation. The LAN9313/LAN9313i provides 2 on-chip PHYs, 1 Virtual PHY and 3 MACs. The Virtual PHY and the third MAC are used to connect the LAN9313/LAN9313i switch fabric to an external MAC or PHY. All ports support automatic or manual full duplex flow control or half duplex backpressure (forced collision) flow control. 2K jumbo packet (2048 byte) support allows for oversized packet transfers, effectively increasing throughput while decreasing CPU load. All MAC and PHY related settings are fully configurable via their respective registers within the LAN9313/LAN9313i.

The integrated SPI, I²C and SMI slave controllers allow for full serial management of the LAN9313/LAN9313i via the integrated SPI/I²C serial interface or MII interface respectively. The inclusion of these interfaces allows for greater flexibility in the incorporation of the LAN9313/LAN9313i into various designs. It is this flexibility which allows the LAN9313/LAN9313i to operate in 2 different modes and under various management conditions. In MAC mode, the LAN9313/LAN9313i can be connected to an external PHY via the MII interface. In PHY mode, the LAN9313/LAN9313i can be connected to an external MAC via the MII interface. In both MAC and PHY modes, the LAN9313/LAN9313i can be unmanaged, SMI managed, I²C managed or SPI managed. This flexibility in management makes the LAN9313/LAN9313i a candidate for virtually all switch applications.

The LAN9313/LAN9313i contains an I²C/Microwire master EEPROM controller for connection to an optional EEPROM. This allows for the storage and retrieval of static data. The internal EEPROM Loader can be optionally configured to automatically load stored configuration settings from the EEPROM into the LAN9313/LAN9313i at reset, allowing the LAN9313/LAN9313i to operate unmanaged.

In addition to the primary functionality described above, the LAN9313/LAN9313i provides additional features designed for extended functionality. These include a configurable 16-bit General Purpose Timer (GPT), a 32-bit 25MHz free running counter, a 12-bit configurable GPIO/LED interface, and IEEE 1588 time stamping on all ports and select GPIOs. The IEEE time stamp unit provides a 64-bit tunable clock for accurate PTP timing and a timer comparator to allow time based interrupt generation.

The LAN9313/LAN9313i's performance, features and small size make it an ideal solution for many applications in the consumer electronics and industrial automation markets. Targeted applications include: set top boxes (cable, satellite and IP), digital televisions, digital video recorders, voice over IP and video phone systems, home gateways, and test and measurement equipment.

2.2 Block Diagram

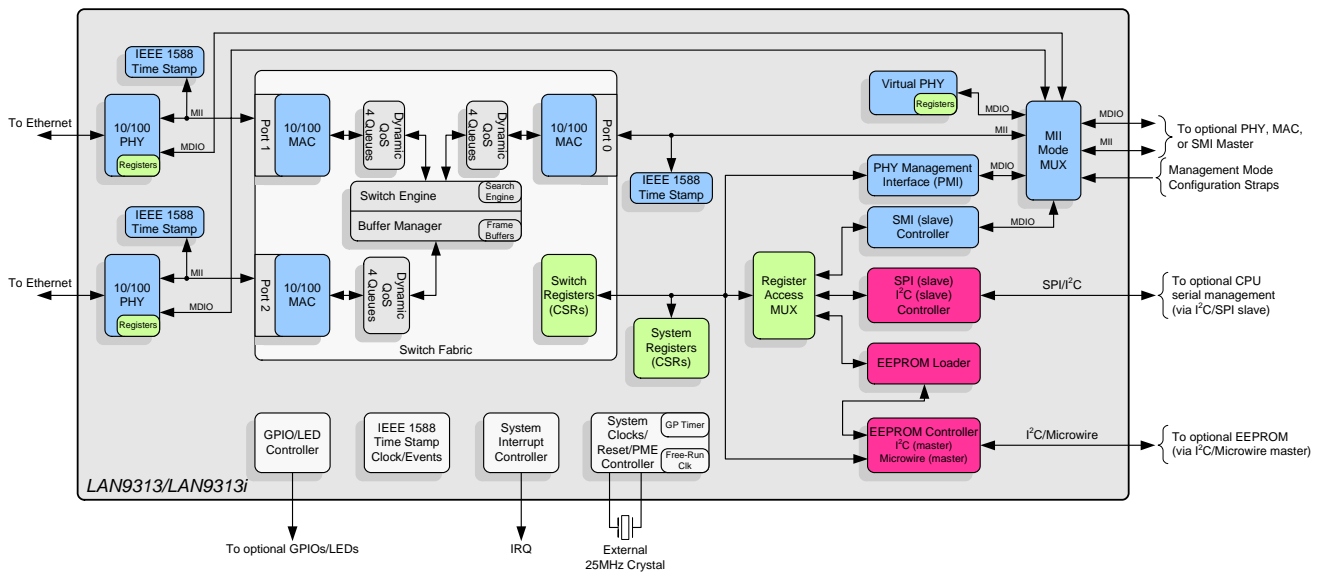

Figure 2.1 Internal LAN9313/LAN9313i Block Diagram

2.2.1 System Clocks/Reset/PME Controller

A clock module contained within the LAN9313/LAN9313i generates all the system clocks required by the device. This module interfaces directly with the external 25MHz crystal/oscillator to generate the required clock divisions for each internal module, with the exception of the 1588 clocks, which are generated in the 1588 Time Stamp Clock/Events module. A 16-bit general purpose timer and 32-bit free-running clock are provided by this module for general purpose use. The Port 1 & 2 PHYs provide general power-down and energy detect power-down modes, which allow a reduction in PHY power consumption.

The LAN9313/LAN9313i reset events are categorized as chip-level resets, multi-module resets, and single-module resets.

A chip-level reset is initiated by assertion of any of the following input events:

- **Power-On Reset**
- **nRST Pin Reset**

A multi-module reset is initiated by assertion of the following:

- **Digital Reset** - DIGITAL_RST (bit 0) in the [Reset Control Register \(RESET_CTL\)](#)
 - Resets all LAN9313/LAN9313i sub-modules except the Ethernet PHYs (Port 1 PHY, Port 2 PHY, and Virtual PHY)

A single-module reset is initiated by assertion of the following:

- **Port 2 PHY Reset** - PHY2_RST (bit 2) in the [Reset Control Register \(RESET_CTL\)](#) or Reset (bit 15) in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#)
 - Resets the Port 2 PHY
- **Port 1 PHY Reset** - PHY1_RST (bit 1) in the [Reset Control Register \(RESET_CTL\)](#) or Reset (bit 15) in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#)
 - Resets the Port 1 PHY
- **Virtual PHY Reset** - VPHY_RST (bit 0) in the [Reset Control Register \(RESET_CTL\)](#) or Reset (bit 15) in the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#)
 - Resets the Virtual PHY

2.2.2 System Interrupt Controller

The LAN9313/LAN9313i provides a multi-tier programmable interrupt structure which is controlled by the System Interrupt Controller. At the top level are the [Interrupt Status Register \(INT_STS\)](#) and [Interrupt Enable Register \(INT_EN\)](#). These registers aggregate and control all interrupts from the various LAN9313/LAN9313i sub-modules. The LAN9313/LAN9313i is capable of generating interrupt events from the following:

- **1588 Time Stamp**
- **Switch Fabric**
- **Ethernet PHYs**
- **GPIOs**
- **General Purpose Timer**
- **Software (general purpose)**

A dedicated programmable IRQ interrupt output pin is provided for external indication of any LAN9313/LAN9313i interrupts. The IRQ pin is controlled via the [Interrupt Configuration Register \(IRQ_CFG\)](#), which allows configuration of the IRQ buffer type, polarity, and de-assertion interval.

2.2.3 Switch Fabric

The Switch Fabric consists of the following major function blocks:

- **10/100 MACs**
 There is one 10/100 Ethernet MAC per switch fabric port, which provides basic 10/100 Ethernet functionality, including transmission deferral, collision back-off/retry, TX/RX FCS checking/generation, TX/RX pause flow control, and transmit back pressure. The 10/100 MACs act as an interface between the switch engine and the 10/100 PHYs (for ports 1 and 2). The port 0 10/100 MAC interfaces the switch engine to the external MAC/PHY (see [Section 2.3, "Modes of Operation"](#)). Each 10/100 MAC includes RX and TX FIFOs and per port statistic counters.
- **Switch Engine**
 This block, consisting of a 3 port VLAN layer 2 switching engine, provides the control for all forwarding/filtering rules and supports untagged, VLAN tagged, and priority tagged frames. The switch engine provides an extensive feature set which includes spanning tree protocol support, multicast packet filtering and Quality of Service (QoS) packet prioritization by VLAN tag, destination address, and port default value or DIFFSERV/TOS, allowing for a range of prioritization implementations. A 1K entry forwarding table provides ample room for MAC address forwarding tables.
- **Buffer Manager**
 This block controls the free buffer space, multi-level transmit queues, transmission scheduling, and packet dropping of the switch fabric. 32K of buffer RAM allows for the storage of multiple packets while forwarding operations are completed. Each port is allocated 1a cluster of 4 dynamic QoS queues which allow each queue size to grow and shrink with traffic, effectively utilizing all available memory. This memory is managed dynamically via the Buffer Manager block.
- **Switch CSRs**
 This block contains all switch related control and status registers, and allows all aspects of the switch fabric to be managed. These registers are indirectly accessible via the system control and status registers

2.2.4 Ethernet PHYs

The LAN9313/LAN9313i contains three PHYs: Port 1 PHY, Port 2 PHY and a Virtual PHY. The Port 1 & 2 PHYs are identical in functionality and each connect their corresponding Ethernet signal pins to the switch fabric MAC of their respective port. These PHYs interface with their respective MAC via an internal MII interface. The Virtual PHY provides the virtual functionality of a PHY and allows connection of an external MAC to port 0 of the switch fabric as if it was connected to a single port PHY. All PHYs comply with the IEEE 802.3 Physical Layer for Twisted Pair Ethernet and can be configured for full/half duplex 100 Mbps (100BASE-TX) or 10Mbps (10BASE-T) Ethernet operation. All PHY registers follow the IEEE 802.3 (clause 22.2.4) specified MII management register set.

2.2.5 PHY Management Interface (PMI)

The PHY Management Interface (PMI) is used to serially access the internal PHYs as well as the external PHY on the MII pins (in MAC mode only, see [Section 2.3, "Modes of Operation"](#)). The PMI implements the IEEE 802.3 management protocol, providing read/write commands for PHY configuration.

2.2.6 SPI/I²C Slave Controller

This module provides an SPI/I²C slave interface which can be used for CPU serial management of the LAN9313/LAN9313i.

The SPI slave controller allows CPU access to all system CSRs for configuration and management. The SPI slave controller supports single register and multiple register read and write commands. Multiple read and multiple write commands support incrementing, decrementing, and static addressing.

The I²C slave controller implements the low level I²C slave serial interface (start and stop condition detection, data bit transmission/reception, and acknowledge generation/reception), handles the slave command protocol, and performs system register reads and writes. The I²C slave controller conforms to the Philips *I²C-Bus Specification*.

A list of management modes and configurations settings for these modes is discussed in [Section 2.3, "Modes of Operation"](#)

2.2.7 SMI Slave Controller

This module provides a SMI slave interface which can be used for CPU management of the LAN9313/LAN9313i via the MII pins, and allows CPU access to all system CSRs. SMI uses the same pins and protocol of the IEEE MII management function, and differs only in that SMI provides access to all internal registers by using a non-standard extended addressing map. The SMI protocol co-exists with the MII management protocol by using the upper half of the PHY address space (16 through 31).

A list of management modes and configurations settings for these modes is discussed in [Section 2.3, "Modes of Operation"](#)

2.2.8 EEPROM Controller/Loader

The EEPROM Controller is an I²C/Microwire master module which interfaces an optional external EEPROM with the system register bus and the EEPROM Loader. Multiple types (I²C/Microwire) and sizes of external EEPROMs are supported. Configuration of the EEPROM type and size are accomplished via the `eeprom_type_strap` and `eeprom_size_strap[1:0]` configuration straps respectively. Various commands are supported for each EEPROM type, allowing for the storage and retrieval of static data. The I²C interface conforms to the Philips *I²C-Bus Specification*.

The EEPROM Loader module interfaces to the EEPROM Controller, Ethernet PHYs, and the system CSRs. The EEPROM Loader provides the automatic loading of configuration settings from the EEPROM into the LAN9313/LAN9313i at reset, allowing the LAN9313/LAN9313i to operate unmanaged. The EEPROM Loader runs upon a pin reset (`nRST`), power-on reset (POR), digital reset (`DIGITAL_RST` bit in the [Reset Control Register \(RESET_CTL\)](#)), or upon the issuance of a RELOAD command via the [EEPROM Command Register \(E2P_CMD\)](#).

2.2.9 1588 Time Stamp

The IEEE 1588 Time Stamp modules provide hardware support for the IEEE 1588 Precision Time Protocol (PTP), allowing clock synchronization with remote Ethernet devices, packet time stamping, and time driven event generation. Time stamping is supported on all ports, with an individual IEEE 1588 Time Stamp module connected to each port via the MII bus. Any port may function as a master or a slave clock per the IEEE 1588 specification, and the LAN9313/LAN9313i as a whole may function as a boundary clock.

A 64-bit tunable clock is provided that is used as the time source for all IEEE 1588 time stamp related functions. The IEEE 1588 Clock/Events block provides IEEE 1588 clock comparison based interrupt generation and time stamp related GPIO event generation. Two LAN9313/LAN9313i GPIO pins (`GPIO[8:9]`) can be used to trigger a time stamp capture when configured as an input, or output a signal from the GPIO based on an IEEE 1588 clock target compare event when configured as an output. All features of the IEEE 1588 hardware time stamp unit can be monitored and configured via their respective IEEE 1588 configuration and status registers (CSRs).

2.2.10 GPIO/LED Controller

The LAN9313/LAN9313i provides 12 configurable general-purpose input/output pins which are controlled via this module. These pins can be individually configured via the GPIO/LED CSRs to function as inputs, push-pull outputs, or open drain outputs and each is capable of interrupt generation with configurable polarity. Two of the GPIO pins (`GPIO[9:8]`) can be used for IEEE 1588 timestamp functions, allowing GPIO driven 1588 time clock capture when configured as an input, or GPIO output generation based on an IEEE 1588 clock target compare event.

Datasheet

In addition, 8 of the GPIO pins can be alternatively configured as LED outputs. These pins, GPIO[7:0] (nP1LED[3:0] and nP2LED[3:0]), may be enabled to drive Ethernet status LEDs for external indication of various attributes of the switch ports.

2.3 Modes of Operation

The LAN9313/LAN9313i is designed to integrate into various embedded environments. To accomplish compatibility with a wide range of applications, the LAN9313/LAN9313i can operate in 2 different modes (MAC mode and PHY mode) and under various management conditions (unmanaged, SMI managed, I²C managed, or SPI managed). The mode and management type of the LAN9313/LAN9313i is determined by the MII_mode_strap and mngt_mode_strap[1:0] configuration straps respectively. These modes and management types are detailed in the following sections. [Figure 2.2](#) displays a typical system configuration for each mode and management type supported by the LAN9313/LAN9313i.

2.3.1 MAC Mode

The LAN9313/LAN9313i MAC mode utilizes an external PHY, which is connected to the MII pins, to provide a third Ethernet network connection. In this mode, the LAN9313/LAN9313i acts as a MAC, providing a communication path between the switch fabric and the external PHY. In MAC mode, the LAN9313/LAN9313i may be unmanaged, SMI managed, I²C managed, or SPI managed as detailed in [Section 2.3.3, "Management Modes"](#).

When an EEPROM is connected, the EEPROM loader can be used to load the initial device configuration from the external EEPROM via the I²C/Microwire interface. Once operational, if managed, the CPU can use the I²C/Microwire interface to read or write the EEPROM.

2.3.2 PHY Mode

The LAN9313/LAN9313i PHY mode utilizes an external MAC to provide a network path for the host CPU. The external MII pins of the LAN9313/LAN9313i must be connected to an external MAC, providing a communication path to the switch fabric. In PHY mode, the LAN9313/LAN9313i may be unmanaged, SMI managed, I²C managed, or SPI managed as detailed in [Section 2.3.3, "Management Modes"](#).

When an EEPROM is connected, the EEPROM loader can be used to load the initial device configuration from the external EEPROM via the I²C/Microwire interface. Once operational, if managed, the CPU can use the I²C/Microwire interface to read or write the EEPROM.

2.3.3 Management Modes

The LAN9313/LAN9313i provides various modes of management in both MAC and PHY modes of operation. Two separate interfaces may be used to manage the LAN9313/LAN9313i: the I²C/SPI slave interface or the SMI/MIIM(Media Independent Interface Management) slave interface.

The I²C/SPI interface runs as either an I²C slave or SPI slave and is used as a register access path for an external CPU.

The SMI/MIIM interface runs as either an SMI/MIIM slave or MIIM master. The master mode is used to access an external PHYs registers under CPU control (assuming the CPU is using I²C or SPI). The slave mode is used for register access by the CPU or external MAC and provides access to either the internal Port 1&2 PHY registers or to all non-PHY registers (using addresses 16-31 and a non-standard extended address map). MIIM and SMI use the same pins and protocol and differ only in that SMI provides access to all internal registers while MIIM provides access to only the Port 1&2 PHY registers. A special mode provides access to the Virtual PHY, which mimics the register operation of a single port standalone PHY. This is used for software compatibility during unmanaged operation.

The selection of LAN9313/LAN9313i modes is determined at startup via the MII_mode_strap and mngt_mode_strap[1:0] configuration straps as detailed in [Table 2.1](#). System configuration diagrams for each mode of the LAN9313/LAN9313i are provided in [Figure 2.2](#).

Table 2.1 LAN9313/LAN9313i Modes

MODE	I²C/MICROWIRE EEPROM INTERFACE	I²C/SPI SLAVE INTERFACE	SMI/MIIM INTERFACE	MII_MODE_STRAP VALUE	MNGT_MODE_STRAP[1:0] VALUE
MAC Mode Unmanaged	Used to load initial configuration from EEPROM	Not used	Not used	0	00
MAC Mode SMI Managed	Used to load initial configuration from EEPROM and for CPU R/W access to EEPROM	Not used	SMI/MIIM slave, used for CPU access to internal PHYs and non-PHY registers	0	01
MAC Mode I ² C Managed	Used to load initial configuration from EEPROM and for CPU R/W access to EEPROM	I ² C slave	MIIM master, used for CPU access to external PHY registers	0	10
MAC Mode SPI Managed	Used to load initial configuration from EEPROM and for CPU R/W access to EEPROM	SPI slave	MIIM master, used for CPU access to external PHY registers	0	11
PHY Mode Unmanaged	Used to load initial configuration from EEPROM	Not used	Virtual MIIM slave, used for external MAC access to Virtual PHY registers	1	00
PHY Mode SMI Managed	Used to load initial configuration from EEPROM and for CPU R/W access to EEPROM	Not used	SMI/MIIM slave, used for CPU access to internal PHYs, Virtual PHY, and non-PHY registers	1	01
PHY Mode I ² C Managed	Used to load initial configuration from EEPROM and for CPU R/W access to EEPROM	I ² C slave	Virtual MIIM slave, used for external MAC access to Virtual PHY registers	1	10
PHY Mode SPI Managed	Used to load initial configuration from EEPROM and for CPU R/W access to EEPROM	SPI slave	Virtual MIIM slave, used for external MAC access to Virtual PHY registers	1	11

3.2 Pin Descriptions

This section contains the descriptions of the LAN9313/LAN9313i pins. The pin descriptions have been broken into functional groups as follows:

- LAN Port 1 Pins
- LAN Port 2 Pins
- LAN Port 1 & 2 Power and Common Pins
- LAN Port 0(External MII) Pins
- Dedicated Configuration Strap Pins
- EEPROM Pins
- Serial Management Pins
- Miscellaneous Pins
- PLL Pins
- Core and I/O Power and Ground Pins
- No-Connect Pins

Note: A list of buffer type definitions is provided in [Section 1.2, "Buffer Types,"](#) on page 16.

Table 3.1 LAN Port 1 Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
89-92	Port 1 LED Indicators	nP1LED[3:0]	OD12	LED Indicators: When configured as LED outputs via the LED Configuration Register (LED_CFG) , these pins are open-drain, active low outputs and the pull-ups and input buffers are disabled. The functionality of each pin is determined via the LED_CFG[9:8] bits.
	General Purpose I/O Data	GPIO[3:0]	IS/O12/ OD12 (PU)	General Purpose I/O Data: When configured as GPIO via the LED Configuration Register (LED_CFG) , these general purpose signals are fully programmable as either push-pull outputs, open-drain outputs or Schmitt-triggered inputs by writing the General Purpose I/O Configuration Register (GPIO_CFG) and General Purpose I/O Data & Direction Register (GPIO_DATA_DIR) . The pull-ups are enabled in GPIO mode. The input buffers are disabled when set as an output. Note: See Chapter 12, "GPIO/LED Controller," on page 142 for additional details.
110	Port 1 Ethernet TX Negative	TXN1	AIO	Ethernet TX Negative: Negative output of Port 1 Ethernet transmitter. See Note 3.1 for additional information.
111	Port 1 Ethernet TX Positive	TXP1	AIO	Ethernet TX Positive: Positive output of Port 1 Ethernet transmitter. See Note 3.1 for additional information.
115	Port 1 Ethernet RX Negative	RXN1	AIO	Ethernet RX Negative: Negative input of Port 1 Ethernet receiver. See Note 3.1 for additional information.
116	Port 1 Ethernet RX Positive	RXP1	AIO	Ethernet RX Positive: Positive input of Port 1 Ethernet receiver. See Note 3.1 for additional information.

Datasheet

Note 3.1 The pin names for the twisted pair pins apply to a normal connection. If HP Auto-MDIX is enabled and a reverse connection is detected or manually selected, the RX and TX pins will be swapped internally.

Table 3.2 LAN Port 2 Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
83-86	Port 2 LED Indicators	nP2LED[3:0]	OD12	LED indicators: When configured as LED outputs via the LED Configuration Register (LED_CFG) , these pins are open-drain, active low outputs and the pull-ups and input buffers are disabled. The functionality of each pin is determined via the LED_CFG[9:8] bits.
	General Purpose I/O Data	GPIO[7:4]	IS/O12/OD12 (PU)	General Purpose I/O Data: When configured as GPIO via the LED Configuration Register (LED_CFG) , these general purpose signals are fully programmable as either push-pull outputs, open-drain outputs or Schmitt-triggered inputs by writing the General Purpose I/O Configuration Register (GPIO_CFG) and General Purpose I/O Data & Direction Register (GPIO_DATA_DIR) . The pull-ups are enabled in GPIO mode. The input buffers are disabled when set as an output. Note: See Chapter 12, "GPIO/LED Controller," on page 142 for additional details.
127	Port 2 Ethernet TX Negative	TXN2	AIO	Ethernet TX Negative: Negative output of Port 2 Ethernet transmitter. See Note 3.2 for additional information.
126	Port 2 Ethernet TX Positive	TXP2	AIO	Ethernet TX Positive: Positive output of Port 2 Ethernet transmitter. See Note 3.2 for additional information.
124	Port 2 Ethernet RX Negative	RXN2	AIO	Ethernet RX Negative: Negative input of Port 2 Ethernet receiver. See Note 3.2 for additional information.
123	Port 2 Ethernet RX Positive	RXP2	AIO	Ethernet RX Positive: Positive input of Port 2 Ethernet receiver. See Note 3.2 for additional information.

Note 3.2 The pin names for the twisted pair pins apply to a normal connection. If HP Auto-MDIX is enabled and a reverse connection is detected or manually selected, the RX and TX pins will be swapped internally.

Table 3.3 LAN Port 1 & 2 Power and Common Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
119	Bias Reference	EXRES	AI	Bias Reference: Used for internal bias circuits. Connect to an external 12.4K ohm, 1% resistor to ground.
114,117	+3.3V Port 1 Analog Power Supply	VDD33A1	P	+3.3V Port 1 Analog Power Supply Refer to the LAN9313/LAN9313i application note for additional connection information.

Table 3.3 LAN Port 1 & 2 Power and Common Pins (continued)

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
122,125	+3.3V Port 2 Analog Power Supply	VDD33A2	P	+3.3V Port 2 Analog Power Supply Refer to the LAN9313/LAN9313i application note for additional connection information.
120	+3.3V Master Bias Power Supply	VDD33BIAS	P	+3.3V Master Bias Power Supply Refer to the LAN9313/LAN9313i application note for additional connection information.
121	Port 2 Transmitter +1.8V Power Supply	VDD18TX2	P	Port 2 Transmitter +1.8V Power Supply: This pin is supplied from the internal PHY voltage regulator. This pin must be tied to the VDD18TX1 pin for proper operation. Refer to the LAN9313/LAN9313i application note for additional connection information.
118	Port 1 Transmitter +1.8V Power Supply	VDD18TX1	P	+1.8V Port 1 Transmitter Power Supply: This pin must be connected directly to the VDD18TX2 pin for proper operation. Refer to the LAN9313/LAN9313i application note for additional connection information.

Table 3.4 LAN Port 0(External MII) Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
19,20,22,23	MII Transmit Data	TXD[3:0]	IS/O8 (PD) Note 3.3	MII Transmit Data: The functionality of these signals is dependant on the mode of the LAN9313/LAN9313i: <ul style="list-style-type: none"> ■ In MAC mode, this is the data from the LAN9313/LAN9313i switch to an external PHY. Table 3.4 LAN Port 0(External MII) Pins (continued)

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
9	MII Receive Error	RXER	IS/O8 (PD) Note 3.3	<p>MII Receive Error: Indicates a receive error in the packet.</p> <ul style="list-style-type: none"> In MAC mode, this signal is input from an external PHY. In PHY mode, this signal is output to an external MAC. This signal is always driven low when in PHY mode. See Note 3.3.
62	MII Transmit Error	TXER	IS/O8 (PD) Note 3.3	<p>MII Transmit Error: Indicates a transmit error in the packet.</p> <ul style="list-style-type: none"> In MAC mode, this signal is output to an external PHY and indicates an invalid symbol is to be transmitted. This signal is always driven low when in MAC mode. See Note 3.3. In PHY mode, this signal is input from an external MAC and indicates the current packet should be aborted.
17	MII Collision	COL	IS/O8 (PU) Note 3.4	<p>MII Collision: Indicates a collision event.</p> <ul style="list-style-type: none"> In MAC mode, this signal is input from an external PHY. In PHY mode, this signal is output to an external MAC. See Note 3.4.
16	MII carrier Sense	CRS	IS/O8 (PD) Note 3.3	<p>MII Carrier Sense: Indicates a network carrier.</p> <ul style="list-style-type: none"> In MAC mode, this signal is input from an external PHY. In PHY mode, this signal is output to an external MAC. See Note 3.3.
24	MII Transmit Clock	TXCLK	IS/O12 (PD) Note 3.3	<p>MII Transmit Clock:</p> <ul style="list-style-type: none"> In MAC mode, this is the transmitter clock input from an external PHY. In PHY mode, this is the transmitter clock output to an external MAC. See Note 3.3.
8,6,5,61	MII Receive Data	RXD[3:0]	IS/O8 (PD) Note 3.3	<p>MII Receive Data:</p> <ul style="list-style-type: none"> In MAC mode, this is the data from an external PHY to the LAN9313/LAN9313i switch. In PHY mode, this is the data from the LAN9313/LAN9313i switch to an external MAC. See Note 3.3.

Table 3.4 LAN Port 0(External MII) Pins (continued)

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
11	MII Receive Data Valid	RXDV	IS/O8 (PD) Note 3.3	<p>MII Receive Data Valid: Indicates valid data on RXD[3:0].</p> <ul style="list-style-type: none"> ■ In MAC mode, this signal is input from an external PHY. ■ In PHY mode, this signal is output to an external MAC. See Note 3.3.
10	MII Receive Clock	RXCLK	IS/O12 (PD) Note 3.3	<p>MII Receive Clock:</p> <ul style="list-style-type: none"> ■ In MAC mode, this is the receiver clock input from an external PHY. ■ In PHY mode, this is the receiver clock output to an external MAC. See Note 3.3.
12	MII Management Data	MDIO	IS/O8 Note 3.5	<p>MII Management Data:</p> <ul style="list-style-type: none"> ■ In SMI/MII slave management modes, this signal is the management data to/from an external master. ■ In MII master management modes, this signal is the management data to/from an external PHY. <p>See Note 3.5</p>
15	MII Management Clock	MDC	IS/O8 Note 3.6	<p>MII Management Clock:</p> <ul style="list-style-type: none"> ■ In SMI/MII slave management modes, this is the management clock input from an external master. ■ In MII master management modes, this is the management clock output to an external PHY. <p>See Note 3.6.</p>
60	MII Port Duplex	MII_DUPLEX	IS (PU) Note 3.7	<p>MII Port Duplex: This pin sets the duplex of the MII port. Its' value can be changed at any time (live value) and can be overridden by disabling the Auto-Negotiation (VPHY_AN) bit in the Virtual PHY Basic Control Register (VPHY_BASIC_CTRL) of the Virtual PHY.</p> <p>In MAC mode, this signal is typically tied to the duplex indication from the external PHY.</p> <p>In PHY mode, this signal is typically tied high or low as needed.</p> <p>The polarity of this signal depends upon the <code>duplex_pol_strap_mii</code> strap. If <code>duplex_pol_strap_mii</code> is 0, a MII_DUPLEX value of 0 indicates full duplex, and 1 indicates half duplex. If <code>duplex_pol_strap_mii</code> is 1, a MII_DUPLEX value of 1 indicates full duplex, and 0 indicates half duplex.</p>

Note 3.3 When used as an output, the pin(s) input buffer(s) and pull-down(s) are disabled.

Datasheet

- Note 3.4** When used as an output, the pin input buffer and pull-up are disabled.
- Note 3.5** An external pull-up is required when the SMI or MII management interface is used. This ensures that the IDLE state of the MDIO signal is logic 1. An external pull-up is recommended when the SMI or MII management interface is not used to avoid a floating signal.
- Note 3.6** When used as an output, the pin input buffer is disabled. An external pull-down is recommended when the SMI or MII management interface is not used to avoid a floating signal.
- Note 3.7** This signal is pulled high through an internal pull-up resistor at all times.

Table 3.5 Dedicated Configuration Strap Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
44	LED Enable Strap	<u>LED_EN</u>	IS (PU) Note 3.8	LED Enable Strap: Configures the default value for the LED_EN bits in the LED Configuration Register (LED_CFG) . When latched low, all 8 LED/GPIO pins are configured as GPIOs. When latched high, all 8 LED/GPIO pins are configured as LEDs. See Note 3.9 .
45,47	LED Function Strap	<u>LED_FUN[1:0]</u>	IS (PU) Note 3.8	LED Function Straps: Configures the default value for the LED_FUN bits in the LED Configuration Register (LED_CFG) . When latched low, the corresponding bit will be cleared. When latched high, the corresponding bit will be set. See Note 3.9 .
56	Port 1 Auto-MDIX Enable Strap	<u>AUTO_MDIX_1</u>	IS (PU) Note 3.8	Port 1 Auto-MDIX Enable Strap: Configures the default value for the Auto-MDIX functionality on Port 1. When latched low, Auto-MDIX is disabled. When latched high, Auto-MDIX is enabled. See Note 3.9 .
55	Port 1 Auto Negotiation Enable Strap	<u>AUTO_NEG_1</u>	IS (PU) Note 3.8	Port 1 Auto Negotiation Enable Strap: Configures the default value for the Auto-Negotiation (PHY_AN) enable bit in the PHY_BASIC_CTRL_1 register (See Section 13.2.2.1). When latched low, auto-negotiation is disabled. When latched high, auto-negotiation is enabled. See Note 3.9 .
53	Port 1 Speed Select Strap	<u>SPEED_1</u>	IS (PU) Note 3.8	Port 1 Speed Select Strap: Configures the default value for the Speed Select LSB (PHY_SPEED_SEL_LSB) bit in the PHY_BASIC_CTRL_1 register (See Section 13.2.2.1). When latched low, 10 Mbps is selected. When latched high, 100 Mbps is selected. See Note 3.9 .
52	Port 1 Duplex Select Strap	<u>DUPLEX_1</u>	IS (PU) Note 3.8	Port 1 Duplex Select Strap: Configures the default value for the Duplex Mode (PHY_DUPLEX) bit in the PHY_BASIC_CTRL_1 register (See Section 13.2.2.1). When latched low, half-duplex is selected. When latched high, full-duplex is selected. See Note 3.9 .
51	Port 1 Backpressure Enable Strap	<u>BP_EN_1</u>	IS (PU) Note 3.8	Port 1 Backpressure Enable Strap: Configures the default value for the Port 1 Backpressure Enable (BP_EN_1) bit of the Port 1 Manual Flow Control Register (MANUAL_FC_1) . When latched low, backpressure is disabled. When latched high, backpressure is enabled. See Note 3.9 .

Table 3.5 Dedicated Configuration Strap Pins (continued)

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
50	Port 1 Full-Duplex Flow Control Enable Strap	<u>FD_FC_1</u>	IS (PU) Note 3.8	Port 1 Full-Duplex Flow Control Enable Strap: Configures the default value of the Port 1 Full-Duplex Transmit Flow Control Enable (TX_FC_1) and Port 1 Full-Duplex Receive Flow Control Enable (RX_FC_1) bits in the Port 1 Manual Flow Control Register (MANUAL_FC_1) , which are used when manual full-duplex control is selected. When latched low, full-duplex Pause packet detection and generation are disabled. When latched high, full-duplex Pause packet detection and generation are enabled. See Note 3.9 .
49	Port 1 Manual Flow Control Enable Strap	<u>MANUAL_FC_1</u>	IS (PU) Note 3.8	Port 1 Manual Flow Control Enable Strap: Configures the default value of the Port 1 Full-Duplex Manual Flow Control Select (MANUAL_FC_1) bit in the Port 1 Manual Flow Control Register (MANUAL_FC_1) . When latched low, flow control is determined by auto-negotiation. When latched high, flow control is determined by the Port 1 Full-Duplex Transmit Flow Control Enable (TX_FC_1) and Port 1 Full-Duplex Receive Flow Control Enable (RX_FC_1) bits. See Note 3.9 .
43	Port 2 Auto-MDIX Enable Strap	<u>AUTO_MDIX_2</u>	IS (PU) Note 3.8	Port 2 Auto-MDIX Enable Strap: Configures the default value for the Auto-MDIX functionality on Port 2. When latched low, Auto-MDIX is disabled. When latched high, Auto-MDIX is enabled. See Note 3.9 .
42	Port 2 Auto Negotiation Enable Strap	<u>AUTO_NEG_2</u>	IS (PU) Note 3.8	Port 2 Auto Negotiation Enable Strap: Configures the default value for the Auto-Negotiation (PHY_AN) enable bit in the PHY_BASIC_CTRL_2 register (See Section 13.2.2.1). When latched low, auto-negotiation is disabled. When latched high, auto-negotiation is enabled. See Note 3.9 .
41	Port 2 Speed Select Strap	<u>SPEED_2</u>	IS (PU) Note 3.8	Port 2 Speed Select Strap: Configures the default value for the Speed Select LSB (PHY_SPEED_SEL_LSB) bit in the PHY_BASIC_CTRL_2 register (See Section 13.2.2.1). When latched low, 10 Mbps is selected. When latched high, 100 Mbps is selected. See Note 3.9 .
38	Port 2 Duplex Select Strap	<u>DUPLEX_2</u>	IS (PU) Note 3.8	Port 2 Duplex Select Strap: Configures the default value for the Duplex Mode (PHY_DUPLEX) bit in the PHY_BASIC_CTRL_2 register (See Section 13.2.2.1). When latched low, half-duplex is selected. When latched high, full-duplex is selected. See Note 3.9 .
37	Port 2 Backpressure Enable Strap	<u>BP_EN_2</u>	IS (PU) Note 3.8	Port 2 Backpressure Enable Strap: Configures the default value for the Port 2 Backpressure Enable (BP_EN_2) bit of the Port 2 Manual Flow Control Register (MANUAL_FC_2) . When latched low, backpressure is disabled. When latched high, backpressure is enabled. See Note 3.9 .

Table 3.5 Dedicated Configuration Strap Pins (continued)

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
36	Port 2 Full-Duplex Flow Control Enable Strap	<u>FD_FC_2</u>	IS (PU) Note 3.8	Port 2 Full-Duplex Flow Control Enable Strap: Configures the default value of the Port 2 Full-Duplex Transmit Flow Control Enable (TX_FC_2) and Port 2 Full-Duplex Receive Flow Control Enable (RX_FC_2) bits in the Port 2 Manual Flow Control Register (MANUAL_FC_2) , which are used when manual full-duplex control is selected. When latched low, full-duplex Pause packet detection and generation are disabled. When latched high, full-duplex Pause packet detection and generation are enabled. See Note 3.9 .
35	Port 2 Manual Flow Control Enable Strap	<u>MANUAL_FC_2</u>	IS (PU) Note 3.8	Port 2 Manual Flow Control Enable Strap: Configures the default value of the Port 2 Full-Duplex Manual Flow Control Select (MANUAL_FC_2) bit in the Port 2 Manual Flow Control Register (MANUAL_FC_2) . When latched low, flow control is determined by auto-negotiation. When latched high, flow control is determined by the Port 2 Full-Duplex Transmit Flow Control Enable (TX_FC_2) and Port 2 Full-Duplex Receive Flow Control Enable (RX_FC_2) bits. See Note 3.9 .
34	Port 0 (External MII) Speed Select Strap	<u>SPEED_MII</u>	IS (PU) Note 3.8	Port 0(External MII) Speed Select Strap: Together with the DUPLEX_POL_MII and MII_DUPLEX pins, configures the base ability values in the Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register (VPHY_AN_LP_BASE_ABILITY) . This pin also configures the speed for Port 0 when the Virtual Auto-Negotiation fails. When latched low, 10Mbps is selected. When latched high, 100Mbps is selected. Refer to Section 13.1.7.6 and Table 13.6 for more information. See Note 3.9 .
32	Port 0 (External MII) Duplex Polarity Strap	<u>DUPLEX_POL_MII</u>	IS (PU) Note 3.8	Port 0(External MII) Duplex Polarity Strap: Configures the polarity of the MII_DUPLEX pin for Port 0. If MII_DUPLEX = DUPLEX_POL_MII , full-duplex is selected. If MII_DUPLEX != DUPLEX_POL_MII , half-duplex is selected. Refer to Section 13.1.7.6 and Table 13.6 for more information. See Note 3.9 .
31	Port 0 (External MII) Backpressure Enable Strap	<u>BP_EN_MII</u>	IS (PU) Note 3.8	Port 0(External MII) Backpressure Enable Strap: Configures the default value for the Port 0 Backpressure Enable (BP_EN_MII) bit of the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . When latched low, backpressure is disabled. When latched high, backpressure is enabled. See Note 3.9 .

Table 3.5 Dedicated Configuration Strap Pins (continued)

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION												
30	Port 0 (External MII) Full-Duplex Flow Control Enable Strap	<u>FD_FC_MII</u>	IS (PU) Note 3.8	Port 0(External MII) Full-Duplex Flow Control Enable Strap: Configures the default of the TX_FC_MII and RX_FC_MII bits in the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . When latched low, flow control is disabled on RX/TX. When latched high, flow control is enabled on RX/TX. See Note 3.9 .												
29	Port 0 (External MII) Manual Flow Control Enable Strap	<u>MANUAL_FC_MII</u>	IS (PU) Note 3.8	Port 0(External MII) Manual Flow Control Enable Strap: Configures the default value of the MANUAL_FC_MII bit in the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . When latched low, flow control is determined by Virtual Auto-Negotiation. When latched high, flow control is determined by TX_FC_MII and RX_FC_MII bits in the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . See Note 3.9 , and Note 3.10 .												
26,28	Serial Management Mode Strap	<u>MNGT_MODE[1:0]</u>	IS (PU) Note 3.8	Serial Management Mode Strap: Configures the serial management mode. 00 = Unmanaged mode 01 = SMI Managed Mode 10 = I²C Managed Mode 11 = SPI Managed Mode See Note 3.9 .												
25	MII Mode Strap	<u>MII_MODE</u>	IS (PU) Note 3.8	MII Mode Strap: Configures the mode of the external MII port. 0 = MAC Mode 1 = PHY Mode See Note 3.9 .												
95	PHY Address Strap	<u>PHY_ADDR_SEL</u>	IS (PU) Note 3.8	<p>PHY Address Strap: Configures the default MII management address values for the PHYs (Virtual, Port 1, and Port 2) as detailed in Section 7.1.1, "PHY Addressing," on page 84.</p> <table border="1" data-bbox="857 1360 1295 1675"> <thead> <tr> <th>PHY_ADDR_SEL VALUE</th> <th>VIRTUAL PHY ADDRESS</th> <th>PORT 1 PHY ADDRESS</th> <th>PORT 2 PHY ADDRESS</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>1</td> <td>2</td> </tr> <tr> <td>1</td> <td>1</td> <td>2</td> <td>3</td> </tr> </tbody> </table> <p>See Note 3.9.</p>	PHY_ADDR_SEL VALUE	VIRTUAL PHY ADDRESS	PORT 1 PHY ADDRESS	PORT 2 PHY ADDRESS	0	0	1	2	1	1	2	3
PHY_ADDR_SEL VALUE	VIRTUAL PHY ADDRESS	PORT 1 PHY ADDRESS	PORT 2 PHY ADDRESS													
0	0	1	2													
1	1	2	3													

Note: For more information on configuration straps, refer to [Section 4.2.4, "Configuration Straps,"](#) on [page 45](#). Additional strap pins, which share functionality with the EEPROM pins, are described in [Table 3.6](#).

Note 3.8 This signal is pulled high through an internal pull-up resistor at all times.

Datasheet

Note 3.9 Configuration strap values are latched on power-on reset or nRST de-assertion. Configuration strap pins are identified by an underlined symbol name. Some configuration straps can be overridden by values from the EEPROM Loader. Refer to [Section 4.2.4, "Configuration Straps,"](#) on page 45 for more information.

Note 3.10 In MAC mode, this strap is not used. In this mode, the Virtual PHY is not applicable, and full-duplex flow control must be controlled manually by the host, based upon the external PHYs Auto-negotiation results.

Table 3.6 EEPROM Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
96	EEPROM Microwire Data Input	EEDI	IS (PD)	EEPROM Microwire Data Input (EEDI): In Microwire EEPROM mode (<u>EEPROM_TYPE</u> = 0), this pin is the Microwire EEPROM serial data input.
	EEPROM I ² C Serial Data Input/Output	<u>EE_SDA</u>	IS/OD8	EEPROM I²C Serial Data Input/Output (EE_SDA): In I ² C EEPROM mode (<u>EEPROM_TYPE</u> = 1), this pin is the I ² C EEPROM serial data input/output.
98	EEPROM Microwire Data Output	EEDO	O8	EEPROM Microwire Data Output: In Microwire EEPROM mode (<u>EEPROM_TYPE</u> = 0), this pin is the Microwire EEPROM serial data output. Note: In I ² C mode (<u>EEPROM_TYPE</u> =1), this pin is not used and is driven low.
	EEPROM Type Strap	<u>EEPROM_TYPE</u>	IS Note 3.11	EEPROM Type Strap: Configures the EEPROM type. See Note 3.12 0 = Microwire Mode 1 = I²C Mode
99	EEPROM Microwire Serial Clock	EECLK	O8	EEPROM Microwire Serial Clock (EECLK): In Microwire EEPROM mode (<u>EEPROM_TYPE</u> = 0), this pin is the Microwire EEPROM clock output.
	EEPROM I ² C Serial Clock	<u>EE_SCL</u>	IS/OD8	EEPROM I²C Serial Clock (EE_SCL): In I ² C EEPROM mode (<u>EEPROM_TYPE</u> =1), this pin is the I ² C EEPROM clock input/open-drain output.
	EEPROM Size Strap 1	<u>EEPROM_SIZE_1</u>	IS Note 3.13	EEPROM Size Strap 1: Configures the high bit of the EEPROM size range as specified in Section 8.2, "I²C/Microwire Master EEPROM Controller," on page 101. This bit is not used for I ² C EEPROMs. See Note 3.12 .
101	EEPROM Microwire Chip Select	EECS	O8	EEPROM Microwire Chip Select: In Microwire EEPROM mode (<u>EEPROM_TYPE</u> = 0), this pin is the Microwire EEPROM chip select output. Note: In I ² C mode (<u>EEPROM_TYPE</u> =1), this pin is not used and is driven low.
	EEPROM Size Strap 0	<u>EEPROM_SIZE_0</u>	IS Note 3.11	EEPROM Size Strap 0: Configures the low bit of the EEPROM size range as specified in Section 8.2, "I²C/Microwire Master EEPROM Controller," on page 101. See Note 3.12 .

Note 3.11 The IS buffer type is valid only during the time specified in [Section 14.5.2, "Reset and Configuration Strap Timing,"](#) on page 390.

Note 3.12 Configuration strap values are latched on power-on reset or nRST de-assertion. Configuration strap pins are identified by an underlined symbol name. Refer to [Section 4.2.4, "Configuration Straps,"](#) on page 45 for more information.

Note 3.13 The IS buffer type is valid only during the time specified in [Section 14.5.2, "Reset and Configuration Strap Timing,"](#) on page 390 and when in I²C mode.

Table 3.7 Serial Management Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
67	SPI Slave Serial Data Input	SI	IS (PU)	<p>SPI Slave Serial Data Input: In SPI slave mode, this pin is the SPI serial data input.</p> <p>Note: In SMI slave and unmanaged modes, this pin is unused and pulled-up internally.</p>
	I ² C Slave Serial Data Input/Output (I ² C Slave Mode)	SDA	IS/OD8	<p>I²C Serial Data Input/Output: In I²C slave mode, this pin is the I²C serial data input/output.</p> <p>Note: In SMI slave and unmanaged modes, this pin is unused and pulled-up internally.</p>
68	SPI Slave Serial Data Output	SO	O8	<p>SPI Slave Serial Data Output: In I²C slave, SMI slave, and unmanaged modes, this pin is not used and is driven low.</p>
69	SPI Slave Chip Select	nSCS	IS (PU)	<p>SPI Slave Chip Select: SPI slave mode chip select input. When low, the LAN9313/LAN9313i SPI slave is selected for SPI transfers. When high, the SPI serial data output (SO) is 3-stated. In I²C slave, SMI slave, and unmanaged modes, this pin is not used.</p>
70	SPI Slave Serial Clock	SCK	IS (PU)	<p>SPI Slave Serial Clock: In SPI slave mode, this pin is the SPI clock input.</p> <p>Note: In SMI slave and unmanaged modes, this pin is unused and pulled-up internally.</p>
	I ² C Slave Serial Clock	SCL	IS	<p>I²C Slave Serial Clock: In I²C slave mode, this pin is the I²C clock input.</p> <p>Note: In SMI slave and unmanaged modes, this pin is unused and pulled-up internally.</p>

Note: Refer to [Section Chapter 8, "Serial Management,"](#) on page 101 for additional information regarding the serial management configuration and functionality.

Table 3.8 Miscellaneous Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
77-79, 82	General Purpose I/O Data	GPIO[11:8]	IS/OD12/ O12 (PU) Note 3.14	<p>General Purpose I/O Data: These general purpose signals are fully programmable as either push-pull outputs, open-drain outputs, or Schmitt-triggered inputs by writing the General Purpose I/O Configuration Register (GPIO_CFG) and General Purpose I/O Data & Direction Register (GPIO_DATA_DIR). For more information, refer to Chapter 12, "GPIO/LED Controller," on page 142.</p> <p>Note: The remaining GPIO[7:0] pins share functionality with the LED output pins, as described in Table 3.1 and Table 3.2.</p>
63	Interrupt Output	IRQ	O8/OD8	<p>Interrupt Output: Interrupt request output. The polarity, source and buffer type of this signal is programmable via the Interrupt Configuration Register (IRQ_CFG). For more information, refer to Chapter 5, "System Interrupts," on page 52.</p>
71	System Reset Input	nRST	IS (PU)	<p>System Reset Input: This active low signal allows external hardware to reset the LAN9313/LAN9313i. The LAN9313/LAN9313i also contains an internal power-on reset circuit. Thus, this signal may be left unconnected if an external hardware reset is not needed. When used, this signal must adhere to the reset timing requirements as detailed in Section 14.5.2, "Reset and Configuration Strap Timing," on page 390.</p>
75	Test 1	TEST1	AI	<p>Test 1: This pin must be tied to VDD33IO for proper operation.</p>
108	Test 2	TEST2	AI	<p>Test 2: This pin must be tied to VDD33IO for proper operation.</p>

Note 3.14 The input buffers are enabled when configured as GPIO inputs only.

Table 3.9 PLL Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
107	PLL +1.8V Power Supply	VDD18PLL	P	<p>PLL +1.8V Power Supply: This pin must be connected to VDD18CORE for proper operation.</p> <p>Refer to the LAN9313/LAN9313i application note for additional connection information.</p>
105	Crystal Input	XI	ICLK	<p>Crystal Input: External 25MHz crystal input. This signal can also be driven by a single-ended clock oscillator. When this method is used, XO should be left unconnected.</p>
106	Crystal Output	XO	OCLK	<p>Crystal Output: External 25MHz crystal output.</p>

Table 3.10 Core and I/O Power and Ground Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
7,13,21,27, 33,39,46, 54,64,66, 72,73,81, 87,93,100	+3.3V I/O Power	VDD33IO	P	+3.3V Power Supply for I/O Pins and Internal Regulator Refer to the LAN9313/LAN9313i application note for additional connection information.
3,14,40,65, 74,88,104	Digital Core +1.8V Power Supply Output	VDD18CORE	P	Digital Core +1.8V Power Supply Output: +1.8V power from the internal core voltage regulator. All VDD18CORE pins must be tied together for proper operation. Refer to the LAN9313/LAN9313i application note for additional connection information.
18,48,80, 97,112,113, 128 Note 3.15	Common Ground	VSS	P	Common Ground

Note 3.15 Plus external pad for 128-XVTQFP package only

Table 3.11 No-Connect Pins

PIN	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1,2, 57-59, 76,94,102, 103,109	No Connect	NC	-	No Connect: These pins must be left floating for normal device operation.

Chapter 4 Clocking, Resets, and Power Management

4.1 Clocks

The LAN9313/LAN9313i includes a clock module which provides generation of all system clocks as required by the various sub-modules of the device. The LAN9313/LAN9313i requires a fixed-frequency 25MHz clock source for use by the internal clock oscillator and PLL. This is typically provided by attaching a 25MHz crystal to the XI and XO pins as specified in [Section 14.6, "Clock Circuit," on page 394](#). Optionally, this clock can be provided by driving the XI input pin with a single-ended 25MHz clock source. If a single-ended source is selected, the clock input must run continuously for normal device operation. The internal PLL generates a fixed 200MHz base clock which is used to derive all LAN9313/LAN9313i sub-system clocks.

In addition to the sub-system clocks, the clock module is also responsible for generating the clocks used for the general purpose timer and free-running clock. Refer to [Chapter 11, "General Purpose Timer & Free-Running Clock," on page 141](#) for additional details.

Note: Crystal specifications are provided in [Table 14.10, "LAN9313/LAN9313i Crystal Specifications," on page 394](#).

4.2 Resets

The LAN9313/LAN9313i provides multiple hardware and software reset sources, which allow varying levels of the LAN9313/LAN9313i to be reset. All resets can be categorized into three reset types as described in the following sections:

- **Chip-Level Resets**
 - Power-On Reset (POR)
 - nRST Pin Reset
- **Multi-Module Resets**
 - Digital Reset (DIGITAL_RST)
- **Single-Module Resets**
 - Port 2 PHY Reset
 - Port 1 PHY Reset
 - Virtual PHY Reset

The LAN9313/LAN9313i supports the use of configuration straps to allow automatic custom configurations of various LAN9313/LAN9313i parameters. These configuration strap values are set upon de-assertion of all chip-level resets and can be used to easily set the default parameters of the chip at power-on or pin (nRST) reset. Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for detailed information on the usage of these straps.

Note: The LAN9313/LAN9313i EEPROM Loader is run upon a power-on reset, nRST pin reset, and digital reset. Refer to [Section 8.2.4, "EEPROM Loader," on page 113](#) for additional information.

[Table 4.1](#) summarizes the effect of the various reset sources on the LAN9313/LAN9313i. Refer to the following sections for detailed information on each of these reset types.

Table 4.1 Reset Sources and Affected LAN9313/LAN9313i Circuitry

RESET SOURCE	SYSTEM CLOCKS/RESET/PME	SYS INTERRUPTS	SWITCH FABRIC	ETHERNET PHYS	PMI	SPI/I ² C SLAVE	SMI SLAVE	EEPROM CONTROLLER	1588 TIME STAMP	GPIO/LED CONTROLLER	CONFIG. STRAPS LATCHED	EEPROM LOADER RUN

Digital Reset	X	X	X		X	X	X	X	X	X		X
Port 2 PHY				X								
Port 1 PHY				X								
Virtual PHY				X								

4.2.1 Chip-Level Resets

A chip-level reset event activates all internal resets, effectively resetting the entire LAN9313/LAN9313i. Configuration straps are latched, and the EEPROM Loader is run as a result of chip-level resets. A chip-level reset is initiated by assertion of any of the following input events:

- Power-On Reset (POR)
- nRST Pin Reset

Chip-level reset/configuration completion can be determined by first polling the [Byte Order Test Register \(BYTE_TEST\)](#). The returned data will be invalid until the serial interface resets are complete. Once the returned data is the correct byte ordering value, the serial interface resets have completed. The completion of the entire chip-level reset must then be determined by polling the READY bit of the [Hardware Configuration Register \(HW_CFG\)](#) until it is set. When set, the READY bit indicates that the reset has completed and the device is ready to be accessed.

With the exception of the [Hardware Configuration Register \(HW_CFG\)](#), [Byte Order Test Register \(BYTE_TEST\)](#), and [Reset Control Register \(RESET_CTL\)](#), read access to any internal resources is forbidden while the READY bit is cleared. Writes to any address are invalid until the READY bit is set.

4.2.1.1 Power-On Reset (POR)

A power-on reset occurs whenever power is initially applied to the LAN9313/LAN9313i, or if the power is removed and reapplied to the LAN9313/LAN9313i. This event resets all circuitry within the device. Configuration straps are latched, and the EEPROM Loader is run as a result of this reset.

A POR reset typically takes approximately 23mS, plus additional time (91uS for I²C, 28uS for Microwire) per byte of data loaded from the EEPROM via the EEPROM Loader. A full EEPROM load (64KB for I²C, 2KB for Microwire) will complete in approximately 6.0 seconds for I²C EEPROM, and 80mS for Microwire EEPROM.

Datasheet**4.2.1.2 nRST Pin Reset**

Driving the nRST input pin low initiates a chip-level reset. This event resets all circuitry within the device. Use of this reset input is optional, but when used, it must be driven for the period of time specified in [Section 14.5.2, "Reset and Configuration Strap Timing," on page 390](#). Configuration straps are latched, and the EEPROM Loader is run as a result of this reset.

A nRST pin reset typically takes approximately 760uS, plus additional time (91uS for I²C, 28uS for Microwire) per byte of data loaded from the EEPROM via the EEPROM Loader. A full EEPROM load (64KB for I²C, 2KB for Microwire) will complete in approximately 6.0 seconds for I²C EEPROM, and 58mS for Microwire EEPROM.

Note: The nRST pin is pulled-high internally. If unused, this signal can be left unconnected. Do not rely on internal pull-up resistors to drive signals external to the device.

Please refer to [Section Table 3.8, "Miscellaneous Pins," on page 39](#) for a description of the nRST pin.

4.2.2 Multi-Module Resets

Multi-module resets activate multiple internal resets, but do not reset the entire chip. Configuration straps are *not* latched upon multi-module resets. A multi-module reset is initiated by assertion of the following:

- [Digital Reset \(DIGITAL_RST\)](#)

Multi-module reset/configuration completion can be determined by first polling the [Byte Order Test Register \(BYTE_TEST\)](#). The returned data will be invalid until the serial interface resets are complete. Once the returned data is the correct byte ordering value, the serial interface resets have completed. The completion of the entire chip-level reset must then be determined by polling the READY bit of the [Hardware Configuration Register \(HW_CFG\)](#) until it is set. When set, the READY bit indicates that the reset has completed and the device is ready to be accessed.

With the exception of the [Hardware Configuration Register \(HW_CFG\)](#), [Byte Order Test Register \(BYTE_TEST\)](#), and [Reset Control Register \(RESET_CTL\)](#), read access to any internal resources is forbidden while the READY bit is cleared. Writes to any address are invalid until the READY bit is set.

Note: The digital reset does not reset register bits designated as NASR.

4.2.2.1 Digital Reset (DIGITAL_RST)

A digital reset is performed by setting the DIGITAL_RST bit of the [Reset Control Register \(RESET_CTL\)](#). A digital reset will reset all LAN9313/LAN9313i sub-modules except the Ethernet PHYs (Port 1 PHY, Port 2 PHY, and Virtual PHY). The EEPROM Loader will automatically run following this reset. Configuration straps are *not* latched as a result of a digital reset.

A digital reset typically takes approximately 760uS, plus additional time (91uS for I²C, 28uS for Microwire) per byte of data loaded from the EEPROM via the EEPROM Loader. A full EEPROM load (64KB for I²C, 2KB for Microwire) will complete in approximately 6.0 seconds for I²C EEPROM, and 58mS for Microwire EEPROM.

4.2.3 Single-Module Resets

A single-module reset will reset only the specified module. Single-module resets do *not* latch the configuration straps or initiate the EEPROM Loader. A single-module reset is initiated by assertion of the following:

- [Port 2 PHY Reset](#)
- [Port 1 PHY Reset](#)
- [Virtual PHY Reset](#)

4.2.3.1 Port 2 PHY Reset

A Port 2 PHY reset is performed by setting the PHY2_RST bit of the [Reset Control Register \(RESET_CTL\)](#) or the Reset bit in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). Upon completion of the Port 2 PHY reset, the PHY2_RST and Reset bits are automatically cleared. No other modules of the LAN9313/LAN9313i are affected by this reset.

In addition to the methods above, the Port 2 PHY is automatically reset after returning from a PHY power-down mode. This reset differs in that the PHY power-down mode reset does not reload or reset any of the PHY registers. Refer to [Section 7.2.9, "PHY Power-Down Modes," on page 96](#) for additional information.

Port 2 PHY reset completion can be determined by polling the PHY2_RST bit in the [Reset Control Register \(RESET_CTL\)](#) or the Reset bit in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) until it clears. Under normal conditions, the PHY2_RST and Reset bit will clear approximately 110uS after the Port 2 PHY reset occurrence.

Note: When using the Reset bit to reset the Port 2 PHY, register bits designated as NASR are not reset.

Refer to [Section 7.2.10, "PHY Resets," on page 97](#) for additional information on Port 2 PHY resets.

4.2.3.2 Port 1 PHY Reset

A Port 1 PHY reset is performed by setting the PHY1_RST bit of the [Reset Control Register \(RESET_CTL\)](#) or the Reset bit in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). Upon completion of the Port 1 PHY reset, the PHY1_RST and Reset bits are automatically cleared. No other modules of the LAN9313/LAN9313i are affected by this reset.

In addition to the methods above, the Port 1 PHY is automatically reset after returning from a PHY power-down mode. This reset differs in that the PHY power-down mode reset does not reload or reset any of the PHY registers. Refer to [Section 7.2.9, "PHY Power-Down Modes," on page 96](#) for additional information.

Port 1 PHY reset completion can be determined by polling the PHY1_RST bit in the [Reset Control Register \(RESET_CTL\)](#) or the Reset bit in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) until it clears. Under normal conditions, the PHY1_RST and Reset bit will clear approximately 110uS after the Port 1 PHY reset occurrence.

Note: When using the Reset bit to reset the Port 1 PHY, register bits designated as NASR are not reset.

Refer to [Section 7.2.10, "PHY Resets," on page 97](#) for additional information on Port 1 PHY resets.

4.2.3.3 Virtual PHY Reset

A Virtual PHY reset is performed by setting the VPHY_RST bit of the [Reset Control Register \(RESET_CTL\)](#) or Reset in the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#). No other modules of the LAN9313/LAN9313i are affected by this reset.

Virtual PHY reset completion can be determined by polling the VPHY_RST bit in the [Reset Control Register \(RESET_CTL\)](#) or the Reset bit in the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) until it clears. Under normal conditions, the VPHY_RST and Reset bit will clear approximately 1uS after the Virtual PHY reset occurrence.

Refer to [Section 7.3.3, "Virtual PHY Resets," on page 100](#) for additional information on Virtual PHY resets.

Datasheet

4.2.4 Configuration Straps

Configuration straps allow various features of the LAN9313/LAN9313i to be automatically configured to user defined values. Configuration straps can be organized into two main categories: hard-straps and soft-straps. Both hard-straps and soft-straps are latched upon Power-On Reset (POR) or pin reset (nRST). The primary difference between these strap types is that soft-strap default values can be overridden by the EEPROM Loader, while hard-straps cannot.

Configuration straps which have a corresponding external pin include internal resistors in order to prevent the signal from floating when unconnected. If a particular configuration strap is connected to a load, an external pull-up or pull-down resistor should be used to augment the internal resistor to ensure that it reaches the required voltage level prior to latching. The internal resistor can also be overridden by the addition of an external resistor.

Note: The system designer must guarantee that configuration strap pins meet the timing requirements specified in [Section 14.5.2, "Reset and Configuration Strap Timing," on page 390](#). If configuration strap pins are not at the correct voltage level prior to being latched, the LAN9313/LAN9313i may capture incorrect strap values.

4.2.4.1 Soft-Straps

Soft-strap values are latched on the release of POR or nRST and are overridden by values from the EEPROM Loader (when an EEPROM is present). These straps are used as direct configuration values or as defaults for CPU registers. Some, but not all, soft-straps have an associated pin. Those that do not have an associated pin, have a tie off default value. All soft-strap values can be overridden by the EEPROM Loader. [Table 4.2](#) provides a list of all soft-straps and their associated pin or default value. Straps which have an associated pin are also fully defined in [Chapter 3, "Pin Description and Configuration," on page 26](#). Refer to [Section 8.2.4, "EEPROM Loader," on page 113](#) for information on the operation of the EEPROM Loader and the loading of strap values.

Upon setting the DIGITAL_RST bit in the [Reset Control Register \(RESET_CTL\)](#) or upon issuing a RELOAD command via the [EEPROM Command Register \(E2P_CMD\)](#), these straps return to their original latched (non-overridden) values if an EEPROM is no longer attached or has been erased. The associated pins are not re-sampled. (i.e. The value latched on the pin during the last POR or nRST will be used, not the value on the pin during the digital reset or RELOAD command issuance). If it is desired to re-latch the current configuration strap pin values, a POR or nRST must be issued.

Table 4.2 Soft-Strap Configuration Strap Definitions

STRAP NAME	DESCRIPTION	PIN / DEFAULT VALUE
LED_en_strap[7:0]	<p>LED Enable Straps: Configures the default value for the LED_EN bits in the LED Configuration Register (LED_CFG). A high value configures the associated LED/GPIO pin as a LED. A low value configures the associated LED/GPIO pin as a GPIO.</p> <p>Note: One pin configures the default for all 8 LED/GPIOs, but 8 separate bits are loaded by the EEPROM Loader, allowing individual control over each LED/GPIO.</p>	<u>LED_EN</u>
LED_fun_strap[1:0]	<p>LED Function Straps: Configures the default value for the LED_FUN bits in the LED Configuration Register (LED_CFG). When configured low, the corresponding bit will be cleared. When configured high, the corresponding bit will be set.</p>	<u>LED_FUN[1:0]</u>

Table 4.2 Soft-Strap Configuration Strap Definitions (continued)

STRAP NAME	DESCRIPTION	PIN / DEFAULT VALUE
auto_mdix_strap_1	<p>Port 1 Auto-MDIX Enable Strap: Configures the default value for the Auto-MDIX functionality on Port 1 when the AMDIXCTL bit in the Port x PHY Special Control/Status Indication Register (PHY_SPECIAL_CONTROL_STAT_IND_x) is cleared. When configured low, Auto-MDIX is disabled. When configured high, Auto-MDIX is enabled.</p> <p>Note: If AMDIXCTL is set, this strap had no effect.</p>	<u>AUTO MDIX 1</u>
manual_mdix_strap_1	<p>Port 1 Manual MDIX Strap: Configures MDI(0) or MDIX(1) for Port 1 when the auto_mdix_strap_1 is low and the AMDIXCTL bit of the Port x PHY Special Control/Status Indication Register (PHY_SPECIAL_CONTROL_STAT_IND_x) is cleared.</p>	0b
autoneg_strap_1	<p>Port 1 Auto Negotiation Enable Strap: Configures the default value for the Auto-Negotiation (PHY_AN) enable bit in the PHY_BASIC_CTRL_1 register (See Section 13.2.2.1). When configured low, auto-negotiation is disabled. When configured high, auto-negotiation is enabled.</p> <p>This strap also affects the default value of the following bits:</p> <ul style="list-style-type: none"> ■ PHY_SPEED_SEL_LSB and PHY_DUPLEX bits of the Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x) ■ 10BASE-T Full Duplex (bit 6) and 10BASE-T Half Duplex (bit 5) bits of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) ■ MODE[2:0] bits of the Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x) <p>Refer to the respective register definition sections for additional information.</p>	<u>AUTO NEG 1</u>
speed_strap_1	<p>Port 1 Speed Select Strap: Configures the default value for the Speed Select LSB (PHY_SPEED_SEL_LSB) bit in the PHY_BASIC_CTRL_1 register (See Section 13.2.2.1). When configured low, 10 Mbps is selected. When configured high, 100 Mbps is selected.</p> <p>This strap also affects the default value of the following bits:</p> <ul style="list-style-type: none"> ■ PHY_SPEED_SEL_LSB bit of the Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x) ■ 10BASE-T Full Duplex (bit 6) and 10BASE-T Half Duplex (bit 5) bits of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) ■ MODE[2:0] bits of the Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x) <p>Refer to the respective register definition sections for additional information.</p>	<u>SPEED 1</u>

Table 4.2 Soft-Strap Configuration Strap Definitions (continued)

STRAP NAME	DESCRIPTION	PIN / DEFAULT VALUE
duplex_strap_1	<p>Port 1 Duplex Select Strap: Configures the default value for the Duplex Mode (PHY_DUPLEX) bit in the PHY_BASIC_CTRL_1 register (See Section 13.2.2.1). When configured low, half-duplex is selected. When configured high, full-duplex is selected.</p> <p>This strap also affects the default value of the following bits:</p> <ul style="list-style-type: none"> ■ PHY_DUPLEX bit of the Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x) ■ 10BASE-T Full Duplex (bit 6) of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) ■ MODE[2:0] bits of the Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x) <p>Refer to the respective register definition sections for additional information.</p>	<u>DUPLEX 1</u>
BP_EN_strap_1	<p>Port 1 Backpressure Enable Strap: Configures the default value for the Port 1 Backpressure Enable (BP_EN_1) bit of the Port 1 Manual Flow Control Register (MANUAL_FC_1). When configured low, backpressure is disabled. When configured high, backpressure is enabled.</p>	<u>BP EN 1</u>
FD_FC_strap_1	<p>Port 1 Full-Duplex Flow Control Enable Strap: Configures the default value of the Port 1 Full-Duplex Transmit Flow Control Enable (TX_FC_1) and Port 1 Full-Duplex Receive Flow Control Enable (RX_FC_1) bits in the Port 1 Manual Flow Control Register (MANUAL_FC_1), which are used when manual full-duplex control is selected. When configured low, full-duplex Pause packet detection and generation are disabled. When configured high, full-duplex Pause packet detection and generation are enabled.</p>	<u>FD FC 1</u>
manual_FC_strap_1	<p>Port 1 Manual Flow Control Enable Strap: Configures the default value of the Port 1 Full-Duplex Manual Flow Control Select (MANUAL_FC_1) bit in the Port 1 Manual Flow Control Register (MANUAL_FC_1). When configured low, flow control is determined by auto-negotiation (if enabled), and symmetric PAUSE is advertised (bit 10 of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) is set).</p> <p>When configured high, flow control is determined by the Port 1 Full-Duplex Transmit Flow Control Enable (TX_FC_1) and Port 1 Full-Duplex Receive Flow Control Enable (RX_FC_1) bits, and symmetric PAUSE is not advertised (bit 10 of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) is cleared).</p>	<u>MANUAL FC 1</u>
auto_mdix_strap_2	<p>Port 2 Auto-MDIX Enable Strap: Configures the default value for the Auto-MDIX functionality on Port 2 when the AMDIXCTL bit in the Port x PHY Special Control/Status Indication Register (PHY_SPECIAL_CONTROL_STAT_IND_x) is cleared. When configured low, Auto-MDIX is disabled. When configured high, Auto-MDIX is enabled.</p> <p>Note: If AMDIXCTL is set, this strap had no effect.</p>	<u>AUTO MDIX 2</u>
manual_mdix_strap_2	<p>Port 2 Manual MDIX Strap: Configures MDI(0) or MDIX(1) for Port 2 when the auto_mdix_strap_2 is low and the AMDIXCTL bit of the Port x PHY Special Control/Status Indication Register (PHY_SPECIAL_CONTROL_STAT_IND_x) is cleared.</p>	0b

Table 4.2 Soft-Strap Configuration Strap Definitions (continued)

STRAP NAME	DESCRIPTION	PIN / DEFAULT VALUE
autoneg_strap_2	<p>Port 2 Auto Negotiation Enable Strap: Configures the default value for the Auto-Negotiation (PHY_AN) enable bit in the PHY_BASIC_CTRL_2 register (See Section 13.2.2.1). When configured low, auto-negotiation is disabled. When configured high, auto-negotiation is enabled.</p> <p>This strap also affects the default value of the following bits:</p> <ul style="list-style-type: none"> ■ PHY_SPEED_SEL_LSB and PHY_DUPLEX bits of the Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x) ■ 10BASE-T Full Duplex (bit 6) and 10BASE-T Half Duplex (bit 5) bits of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) ■ MODE[2:0] bits of the Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x) <p>Refer to the respective register definition sections for additional information.</p>	<u>AUTO_NEG_2</u>
speed_strap_2	<p>Port 2 Speed Select Strap: Configures the default value for the Speed Select LSB (PHY_SPEED_SEL_LSB) bit in the PHY_BASIC_CTRL_2 register (See Section 13.2.2.1). When configured low, 10 Mbps is selected. When configured high, 100 Mbps is selected.</p> <p>This strap also affects the default value of the following bits:</p> <ul style="list-style-type: none"> ■ PHY_SPEED_SEL_LSB bit of the Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x) ■ 10BASE-T Full Duplex (bit 6) and 10BASE-T Half Duplex (bit 5) bits of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) ■ MODE[2:0] bits of the Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x) <p>Refer to the respective register definition sections for additional information.</p>	<u>SPEED_2</u>
duplex_strap_2	<p>Port 2 Duplex Select Strap: Configures the default value for the Duplex Mode (PHY_DUPLEX) bit in the PHY_BASIC_CTRL_2 register (See Section 13.2.2.1). When configured low, half-duplex is selected. When configured high, full-duplex is selected.</p> <p>This strap also affects the default value of the following bits:</p> <ul style="list-style-type: none"> ■ PHY_DUPLEX bit of the Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x) ■ 10BASE-T Full Duplex (bit 6) of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) ■ MODE[2:0] bits of the Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x) <p>Refer to the respective register definition sections for additional information.</p>	<u>DUPLEX_2</u>

Table 4.2 Soft-Strap Configuration Strap Definitions (continued)

STRAP NAME	DESCRIPTION	PIN / DEFAULT VALUE
BP_EN_strap_2	Port 2 Backpressure Enable Strap: Configures the default value for the Port 2 Backpressure Enable (BP_EN_2) bit of the Port 2 Manual Flow Control Register (MANUAL_FC_2) . When configured low, backpressure is disabled. When configured high, backpressure is enabled.	<u>BP_EN_2</u>
FD_FC_strap_2	Port 2 Full-Duplex Flow Control Enable Strap: Configures the default value of the Port 2 Full-Duplex Transmit Flow Control Enable (TX_FC_2) and Port 2 Full-Duplex Receive Flow Control Enable (RX_FC_2) bits in the Port 2 Manual Flow Control Register (MANUAL_FC_2) , which are used when manual full-duplex control is selected. When configured low, full-duplex Pause packet detection and generation are disabled. When configured high, full-duplex Pause packet detection and generation are enabled.	<u>FD_FC_2</u>
manual_FC_strap_2	Port 2 Manual Flow Control Enable Strap: Configures the default value of the Port 2 Full-Duplex Manual Flow Control Select (MANUAL_FC_2) bit in the Port 2 Manual Flow Control Register (MANUAL_FC_2) . When configured low, flow control is determined by auto-negotiation (if enabled), and symmetric PAUSE is advertised (bit 10 of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) is set). When configured high, flow control is determined by the Port 2 Full-Duplex Transmit Flow Control Enable (TX_FC_2) and Port 2 Full-Duplex Receive Flow Control Enable (RX_FC_2) bits, and symmetric PAUSE is not advertised (bit 10 of the Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x) is cleared).	<u>MANUAL_FC_2</u>
speed_strap_mii	Port 0(External MII) Speed Select Strap: Together with the duplex_pol_strap_mii and MII_DUPLEX pins, configures the base ability values in the Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register (VPHY_AN_LP_BASE_ABILITY) . This pin configures the speed for Port 0 when the Virtual Auto-Negotiation fails. When configured low, 10Mbps is selected. When configured high, 100Mbps is selected. Refer to Section 13.1.7.6 and Table 13.6 for more information.	<u>SPEED_MII</u>
duplex_pol_strap_mii	Port 0(External MII) Duplex Polarity Strap: Configures the polarity of the MII_DUPLEX pin for Port 0. If MII_DUPLEX = DUPLEX_POL_MII , full-duplex is selected. If MII_DUPLEX != DUPLEX_POL_MII , half-duplex is selected. Refer to Section 13.1.7.6 and Table 13.6 for more information.	<u>DUPLEX_POL_MII</u>
BP_EN_strap_mii	Port 0(External MII) Backpressure Enable Strap: Configures the default value for the Port 0 Backpressure Enable (BP_EN_MII) bit of the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . When configured low, backpressure is disabled. When configured high, backpressure is enabled.	<u>BP_EN_MII</u>

Table 4.2 Soft-Strap Configuration Strap Definitions (continued)

STRAP NAME	DESCRIPTION	PIN / DEFAULT VALUE
FD_FC_strap_mii	Port 0(External MII) Full-Duplex Flow Control Enable Strap: Configures the default of the TX_FC_MII and RX_FC_MII bits in the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) which are used when manual full-duplex flow control is selected. When configured low, flow control is disabled on RX/TX. When configured high, flow control is enabled on RX/TX.	<u>FD_FC_MII</u>
manual_FC_strap_mii	Port 0(External MII) Manual Flow Control Enable Strap: Configures the default value of the MANUAL_FC_MII bit in the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . When configured low, flow control is determined by Virtual Auto-Negotiation (if enabled). When configured high, flow control is determined by TX_FC_MII and RX_FC_MII bits in the Port 0(External MII) Manual Flow Control Register (MANUAL_FC_MII) . Note: In MAC mode, this strap is not used. In this mode, the Virtual PHY is not applicable, and full-duplex flow control must be controlled manually by the host, based upon the external PHYs Auto-negotiation results.	<u>MANUAL_FC_MII</u>
SQE_test_disable_strap_mii	SQE Heartbeat Disable Strap: Configures the Signal Quality Error (Heartbeat) test function by controlling the default value of the SQEOFF (bit 0) of the Virtual PHY Special Control/Status Register (VPHY_SPECIAL_CONTROL_STATUS) . When configured low, SQEOFF defaults to 0 and SQE test is enabled. When configured high, SQEOFF defaults to 1 and SQE test is disabled.	0b

4.2.4.2 Hard-Straps

Hard-straps are latched upon Power-On Reset (POR) or pin reset (nRST) only. Unlike soft-straps, hard-straps always have an associated pin and cannot be overridden by the EEPROM Loader. These straps are used as either direct configuration values or as register defaults. [Table 4.3](#) provides a list of all hard-straps and their associated pin. These straps, along with their pin assignments are also fully defined in [Chapter 3, "Pin Description and Configuration,"](#) on page 26.

Table 4.3 Hard-Strap Configuration Strap Definitions

STRAP NAME	DESCRIPTION	PIN
mngt_mode_strap[1:0]	Serial Management Mode Strap: Configures the default serial management mode. 00 = Unmanaged mode 01 = SMI Managed Mode 10 = I²C Managed Mode 11 = SPI Managed Mode Refer to Section 2.3, "Modes of Operation," on page 23 for additional information on the various modes of the LAN9313/LAN9313i.	<u>MNGT_MODE[1:0]</u>
eeprom_type_strap	EEPROM Type Strap: Configures the EEPROM type. 0 = Microwire Mode 1 = I²C Mode	<u>EEPROM_TYPE</u>

Table 4.3 Hard-Strap Configuration Strap Definitions

STRAP NAME	DESCRIPTION	PIN												
eeeprom_size_strap[1:0]	EEPROM Size Strap [1:0]: Configures the EEPROM size range as specified in Section 8.2, "I2C/Microwire Master EEPROM Controller," on page 101.	<u>EEPROM_SIZE [1:0]</u>												
MII_mode_strap	MII Mode Strap: Configures the default mode of the external MII port. 0 = MAC Mode 1 = PHY Mode Refer to Section 2.3, "Modes of Operation," on page 23 for additional information on the various modes of the LAN9313/LAN9313i.	<u>MII_MODE</u>												
phy_addr_sel_strap	PHY Address Select Strap: Configures the default MII management address values for the PHYs and Virtual PHY as detailed in Section 7.1.1, "PHY Addressing," on page 84. <table border="1" data-bbox="540 745 889 1092"> <thead> <tr> <th>PHY_ADDR_SEL_STRAP VALUE</th> <th>VIRTUAL PHY ADDRESS</th> <th>PORT 1 PHY ADDRESS</th> <th>PORT 2 PHY ADDRESS</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>1</td> <td>2</td> </tr> <tr> <td>1</td> <td>1</td> <td>2</td> <td>3</td> </tr> </tbody> </table>	PHY_ADDR_SEL_STRAP VALUE	VIRTUAL PHY ADDRESS	PORT 1 PHY ADDRESS	PORT 2 PHY ADDRESS	0	0	1	2	1	1	2	3	<u>PHY_ADDR_SEL</u>
PHY_ADDR_SEL_STRAP VALUE	VIRTUAL PHY ADDRESS	PORT 1 PHY ADDRESS	PORT 2 PHY ADDRESS											
0	0	1	2											
1	1	2	3											

4.3 Power Management

The LAN9313/LAN9313i Port 1 and Port 2 PHYs support several power management and wakeup features.

4.3.1 Port 1 & 2 PHY Power Management

The Port 1 & 2 PHYs provide independent general power-down and energy-detect power-down modes which reduce PHY power consumption. General power-down mode provides power savings by powering down the entire PHY, except the PHY management control interface. General power-down mode must be manually enabled and disabled as described in [Section 7.2.9.1, "PHY General Power-Down,"](#) on page 97.

In energy-detect power-down mode, the PHY will resume from power-down when energy is seen on the cable (typically from link pulses). If the ENERGYON interrupt (INT7) of either PHYs [Port x PHY Interrupt Mask Register \(PHY_INTERRUPT_MASK_x\)](#) is unmasked, then the corresponding PHY will generate an interrupt. These interrupts are reflected in the [Interrupt Status Register \(INT_STS\)](#) bit 27 (PHY_INT2) for the Port 2 PHY, and bit 26 (PHY_INT1) for the Port 1 PHY. These interrupts can be used to trigger the IRQ interrupt output pin, as described in [Section 5.2.3, "Ethernet PHY Interrupts,"](#) on page 55. Refer to [Section 7.2.9.2, "PHY Energy Detect Power-Down,"](#) on page 97 for details on the operation and configuration of the PHY energy-detect power-down mode.

Chapter 5 System Interrupts

5.1 Functional Overview

This chapter describes the system interrupt structure of the LAN9313/LAN9313i. The LAN9313/LAN9313i provides a multi-tier programmable interrupt structure which is controlled by the System Interrupt Controller. The programmable system interrupts are generated internally by the various LAN9313/LAN9313i sub-modules and can be configured to generate a single external host interrupt via the IRQ interrupt output pin. The programmable nature of the host interrupt provides the user with the ability to optimize performance dependent upon the application requirements. The IRQ interrupt buffer type, polarity, and de-assertion interval are modifiable. The IRQ interrupt can be configured as an open-drain output to facilitate the sharing of interrupts with other devices. All internal interrupts are maskable and capable of triggering the IRQ interrupt.

5.2 Interrupt Sources

The LAN9313/LAN9313i is capable of generating the following interrupt types:

- [1588 Time Stamp Interrupts](#) (Port 2,1,0 and GPIO 9,8)
- [Switch Fabric Interrupts](#) (Buffer Manager, Switch Engine, and Port 2,1,0 MACs)
- [Ethernet PHY Interrupts](#) (Port 1,2 PHYs)
- [GPIO Interrupts](#) (GPIO[11:0])
- [General Purpose Timer Interrupt](#) (GPT)
- [Software Interrupt](#) (General Purpose)
- [Device Ready Interrupt](#)

All interrupts are accessed and configured via registers arranged into a multi-tier, branch-like structure, as shown in [Figure 5.1](#). At the top level of the LAN9313/LAN9313i interrupt structure are the [Interrupt Status Register \(INT_STS\)](#), [Interrupt Enable Register \(INT_EN\)](#), and [Interrupt Configuration Register \(IRQ_CFG\)](#).

The [Interrupt Status Register \(INT_STS\)](#) and [Interrupt Enable Register \(INT_EN\)](#) aggregate and enable/disable all interrupts from the various LAN9313/LAN9313i sub-modules, combining them together to create the IRQ interrupt. These registers provide direct interrupt access/configuration to the General Purpose Timer, software, and device ready interrupts. These interrupts can be monitored, enabled/disabled, and cleared, directly within these two registers. In addition, interrupt event indications are provided for the 1588 Time Stamp, Switch Fabric, Port 1 & 2 Ethernet PHYs, and GPIO interrupts. These interrupts differ in that the interrupt sources are generated and cleared in other sub-block registers. The INT_STS register does not provide details on what specific event within the sub-module caused the interrupt, and requires the software to poll an additional sub-module interrupt register (as shown in [Figure 5.1](#)) to determine the exact interrupt source and clear it. For interrupts which involve multiple registers, only after the interrupt has been serviced and cleared at its source will it be cleared in the INT_STS register.

The [Interrupt Configuration Register \(IRQ_CFG\)](#) is responsible for enabling/disabling the IRQ interrupt output pin as well as configuring its properties. The IRQ_CFG register allows the modification of the IRQ pin buffer type, polarity, and de-assertion interval. The de-assertion timer guarantees a minimum interrupt de-assertion period for the IRQ output and is programmable via the INT_DEAS field of the [Interrupt Configuration Register \(IRQ_CFG\)](#). A setting of all zeros disables the de-assertion timer. The de-assertion interval starts when the IRQ pin de-asserts, regardless of the reason.

Figure 5.1 Functional Interrupt Register Hierarchy

The following sections detail each category of interrupts and their related registers. Refer to [Chapter 13, "Register Descriptions," on page 146](#) for bit-level definitions of all interrupt registers.

5.2.1 1588 Time Stamp Interrupts

Multiple 1588 Time Stamp interrupt sources are provided by the LAN9313/LAN9313i. The top-level 1588_EVNT (bit 29) of the [Interrupt Status Register \(INT_STS\)](#) provides indication that a 1588 interrupt event occurred in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#).

The [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) provides enabling/disabling and status of all 1588 interrupt conditions. These include TX/RX 1588 clock capture indication on Ports 2,1,0, 1588 clock capture for GPIO[8:9] events, as well as 1588 timer interrupt indication.

In order for a 1588 interrupt event to trigger the external IRQ interrupt pin, the desired 1588 interrupt event must be enabled in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#), bit 29 (1588_EVNT_EN) of the [Interrupt Enable Register \(INT_EN\)](#) must be set, and IRQ output must be enabled via bit 8 (IRQ_EN) of the [Interrupt Configuration Register \(IRQ_CFG\)](#).

For additional details on the 1588 Time Stamp interrupts, refer to [Section 10.6, "IEEE 1588 Interrupts," on page 140](#).

5.2.2 Switch Fabric Interrupts

Multiple Switch Fabric interrupt sources are provided by the LAN9313/LAN9313i in a three-tiered register structure as shown in [Figure 5.1](#). The top-level SWITCH_INT (bit 28) of the [Interrupt Status Register \(INT_STS\)](#) provides indication that a Switch Fabric interrupt event occurred in the [Switch Engine Interrupt Pending Register \(SWE_IPR\)](#).

In turn, the [Switch Engine Interrupt Pending Register \(SWE_IPR\)](#) and [Switch Engine Interrupt Mask Register \(SWE_IMR\)](#) provide status and enabling/disabling of all Switch Fabric sub-modules interrupts (Buffer Manager, Switch Engine, and Port 2,1,0 MACs).

The low-level Switch Fabric sub-module interrupt pending and mask registers of the Buffer Manager, Switch Engine, and Port 2,1,0 MACs provide multiple interrupt sources from their respective sub-modules. These low-level registers provide the following interrupt sources:

- **Buffer Manager** ([Buffer Manager Interrupt Mask Register \(BM_IMR\)](#) and [Buffer Manager Interrupt Pending Register \(BM_IPR\)](#))
 - Status B Pending
 - Status A Pending
- **Switch Engine** ([Switch Engine Interrupt Mask Register \(SWE_IMR\)](#) and [Switch Engine Interrupt Pending Register \(SWE_IPR\)](#))
 - Interrupt Pending
- **Port 2,1,0 MACs** ([Port x MAC Interrupt Mask Register \(MAC_IMR_x\)](#) and [Port x MAC Interrupt Pending Register \(MAC_IPR_x\)](#))
 - No currently supported interrupt sources. These registers are reserved for future use.

In order for a Switch Fabric interrupt event to trigger the external IRQ interrupt pin, the following must be configured:

- The desired Switch Fabric sub-module interrupt event must be enabled in the corresponding mask register ([Buffer Manager Interrupt Mask Register \(BM_IMR\)](#) for the Buffer Manager, [Switch Engine Interrupt Mask Register \(SWE_IMR\)](#) for the Switch Engine, and/or [Port x MAC Interrupt Mask Register \(MAC_IMR_x\)](#) for the Port 2,1,0 MACs)
- The desired Switch Fabric sub-module interrupt event must be enabled in the [Switch Engine Interrupt Mask Register \(SWE_IMR\)](#)
- Bit 28 (SWITCH_INT_EN) of the [Interrupt Enable Register \(INT_EN\)](#) must be set
- IRQ output must be enabled via bit 8 (IRQ_EN) of the [Interrupt Configuration Register \(IRQ_CFG\)](#)

For additional details on the Switch Fabric interrupts, refer to [Section 6.6, "Switch Fabric Interrupts," on page 83](#).

5.2.3 Ethernet PHY Interrupts

The Port 1 and Port 2 PHYs each provide a set of identical interrupt sources. The top-level PHY_INT1 (bit 26) and PHY_INT2 (bit 27) of the [Interrupt Status Register \(INT_STS\)](#) provides indication that a PHY interrupt event occurred in the [Port x PHY Interrupt Source Flags Register \(PHY_INTERRUPT_SOURCE_x\)](#).

Port 1 and Port 2 PHY interrupts are enabled/disabled via their respective [Port x PHY Interrupt Mask Register \(PHY_INTERRUPT_MASK_x\)](#). The source of a PHY interrupt can be determined and cleared via the [Port x PHY Interrupt Source Flags Register \(PHY_INTERRUPT_SOURCE_x\)](#). The Port 1 and Port 2 PHYs are each capable of generating unique interrupts based on the following events:

- ENERGYON Activated
- Auto-Negotiation Complete
- Remote Fault Detected
- Link Down (Link Status Negated)
- Auto-Negotiation LP Acknowledge
- Parallel Detection Fault
- Auto-Negotiation Page Received

In order for a Port 1 or Port 2 interrupt event to trigger the external IRQ interrupt pin, the desired PHY interrupt event must be enabled in the corresponding [Port x PHY Interrupt Mask Register \(PHY_INTERRUPT_MASK_x\)](#), the PHY_INT1 (Port 1 PHY) and/or PHY_INT2 (Port 2 PHY) bits of the [Interrupt Enable Register \(INT_EN\)](#) must be set, and IRQ output must be enabled via bit 8 (IRQ_EN) of the [Interrupt Configuration Register \(IRQ_CFG\)](#).

For additional details on the Ethernet PHY interrupts, refer to [Section 7.2.8.1, "PHY Interrupts," on page 96](#).

5.2.4 GPIO Interrupts

Each GPIO[11:0] of the LAN9313/LAN9313i is provided with its own interrupt. The top-level GPIO (bit 12) of the [Interrupt Status Register \(INT_STS\)](#) provides indication that a GPIO interrupt event occurred in the [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#). The [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#) provides enabling/disabling and status of each GPIO[11:0] interrupt.

In order for a GPIO interrupt event to trigger the external IRQ interrupt pin, the desired GPIO interrupt must be enabled in the [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#), bit 12 (GPIO_EN) of the [Interrupt Enable Register \(INT_EN\)](#) must be set, and IRQ output must be enabled via bit 8 (IRQ_EN) of the [Interrupt Configuration Register \(IRQ_CFG\)](#).

For additional details on the GPIO interrupts, refer to [Section 12.2.2, "GPIO Interrupts," on page 143](#).

5.2.5 General Purpose Timer Interrupt

A General Purpose Timer (GPT) interrupt is provided in the top-level [Interrupt Status Register \(INT_STS\)](#) and [Interrupt Enable Register \(INT_EN\)](#) (bit 19). This interrupt is issued when the [General Purpose Timer Configuration Register \(GPT_CFG\)](#) wraps past zero to FFFFh, and is cleared when bit 19 of the [Interrupt Status Register \(INT_STS\)](#) is written with 1.

In order for a General Purpose Timer interrupt event to trigger the external IRQ interrupt pin, the GPT must be enabled via the bit 29 (TIMER_EN) in the [General Purpose Timer Configuration Register \(GPT_CFG\)](#), bit 19 of the [Interrupt Enable Register \(INT_EN\)](#) must be set, and IRQ output must be enabled via bit 8 (IRQ_EN) of the [Interrupt Configuration Register \(IRQ_CFG\)](#).

For additional details on the General Purpose Timer, refer to [Section 11.1, "General Purpose Timer," on page 141](#).

5.2.6 Software Interrupt

A general purpose software interrupt is provided in the top level [Interrupt Status Register \(INT_STS\)](#) and [Interrupt Enable Register \(INT_EN\)](#). The SW_INT interrupt (bit 31) of the [Interrupt Status Register \(INT_STS\)](#) is generated when SW_INT_EN (bit 31) of the [Interrupt Enable Register \(INT_EN\)](#) is set. This interrupt provides an easy way for software to generate an interrupt, and is designed for general software usage.

5.2.7 Device Ready Interrupt

A device ready interrupt is provided in the top-level [Interrupt Status Register \(INT_STS\)](#) and [Interrupt Enable Register \(INT_EN\)](#). The READY interrupt (bit 30) of the [Interrupt Status Register \(INT_STS\)](#) indicates that the LAN9313/LAN9313i is ready to be accessed after a power-up or reset condition. Writing a 1 to this bit in the [Interrupt Status Register \(INT_STS\)](#) will clear it.

In order for a device ready interrupt event to trigger the external IRQ interrupt pin, bit 30 of the [Interrupt Enable Register \(INT_EN\)](#) must be set, and IRQ output must be enabled via bit 8 (IRQ_EN) of the [Interrupt Configuration Register \(IRQ_CFG\)](#).

Chapter 6 Switch Fabric

6.1 Functional Overview

At the core of the LAN9313/LAN9313i is the high performance, high efficiency 3 port Ethernet switch fabric. The switch fabric contains a 3 port VLAN layer 2 switch engine that supports untagged, VLAN tagged, and priority tagged frames. The switch fabric provides an extensive feature set which includes spanning tree protocol support, multicast packet filtering and Quality of Service (QoS) packet prioritization by VLAN tag, destination address, port default value or DIFFSERV/TOS, allowing for a range of prioritization implementations. 32K of buffer RAM allows for the storage of multiple packets while forwarding operations are completed, and a 1K entry forwarding table provides room for MAC address forwarding tables. Each port is allocated a cluster of 4 dynamic QoS queues which allow each queue size to grow and shrink with traffic, effectively utilizing all available memory. This memory is managed dynamically via the buffer manager block within the switch fabric. All aspects of the switch fabric are managed via the switch fabric configuration and status registers (CSR), which are indirectly accessible via the system control and status registers.

The switch fabric consists of four major block types:

- [Switch Fabric CSRs](#) - These registers provide access to various switch fabric parameters for configuration and monitoring.
- [10/100 Ethernet MACs](#) - A total of three MACs are included in the switch fabric which provide basic 10/100 Ethernet functionality for each switch fabric port.
- [Switch Engine \(SWE\)](#) - This block is the core of the switch fabric and provides VLAN layer 2 switching for all three switch ports.
- [Buffer Manager \(BM\)](#) - This block provides control of the free buffer space, transmit queues, and scheduling.

Refer to [Figure 2.1 Internal LAN9313/LAN9313i Block Diagram on page 19](#) for details on the interconnection of the switch fabric blocks within the LAN9313/LAN9313i.

6.2 Switch Fabric CSRs

The switch fabric CSRs provide register level access to the various parameters of the switch fabric. Switch fabric related registers can be classified into two main categories based upon their method of access: direct and indirect.

The directly accessible switch fabric registers are part of the main system CSRs of the LAN9313/LAN9313i and are detailed in [Section 13.1.5, "Switch Fabric," on page 192](#). These registers provide switch fabric manual flow control (Ports 0-2), data/command registers (for access to the indirect switch fabric registers), and switch MAC address configuration.

The indirectly accessible switch fabric registers reside within the switch fabric and must be accessed indirectly via the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#) and [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#), or the set of [Switch Fabric CSR Interface Direct Data Register \(SWITCH_CSR_DIRECT_DATA\)](#). The indirectly accessible switch fabric CSRs provide full access to the many configurable parameters of the switch engine, buffer manager, and each switch port. The switch fabric CSRs are detailed in [Section 13.3, "Switch Fabric Control and Status Registers," on page 253](#).

For detailed descriptions of all switch fabric related registers, refer to [Chapter 13, "Register Descriptions," on page 146](#).

6.2.1 Switch Fabric CSR Writes

To perform a write to an individual switch fabric register, the desired data must first be written into the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#). The write cycle is initiated by performing a single write to the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) with CSR_BUSY (bit 31) set, the CSR_ADDRESS field (bits 15:0) set to the desired register address, the R_nW (bit 30) cleared, the AUTO_INC and AUTO_DEC fields cleared, and the desired CSR byte enable bits selected (bits 19:16). The completion of the write cycle is indicated by the clearing of the CSR_BUSY bit.

A second write method may be used which utilizes the auto increment/decrement function of the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) for writing sequential register addresses. When using this method, the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) must first be written with the auto increment(AUTO_INC) or auto decrement(AUTO_DEC) bit set, the CSR_ADDRESS field written with the desired register address, the R_nW bit cleared, and the desired CSR byte enable bits selected (typically all set). The write cycles are then initiated by writing the desired data into the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#). The completion of the write cycle is indicated by the clearing of the CSR_BUSY bit, at which time the address in the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) is incremented or decremented accordingly. The user may then initiate a subsequent write cycle by writing the desired data into the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#).

The third write method is to use the direct data range write function. Writes within the [Switch Fabric CSR Interface Direct Data Register \(SWITCH_CSR_DIRECT_DATA\)](#) address range automatically set the appropriate register address, set all four byte enable bits (CSR_BE[3:0]), clears the R_nW bit, and sets the CSR_BUSY bit of the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#). The completion of the write cycle is indicated by the clearing of the CSR_BUSY bit. Since the address range of the switch fabric CSRs exceeds that of the [Switch Fabric CSR Interface Direct Data Register \(SWITCH_CSR_DIRECT_DATA\)](#) address range, a sub-set of the switch fabric CSRs are mapped to the [Switch Fabric CSR Interface Direct Data Register \(SWITCH_CSR_DIRECT_DATA\)](#) address range as detailed in [Table 13.3, "Switch Fabric CSR to SWITCH_CSR_DIRECT_DATA Address Range Map,"](#) on page 204.

Figure 6.1 illustrates the process required to perform a switch fabric CSR write.

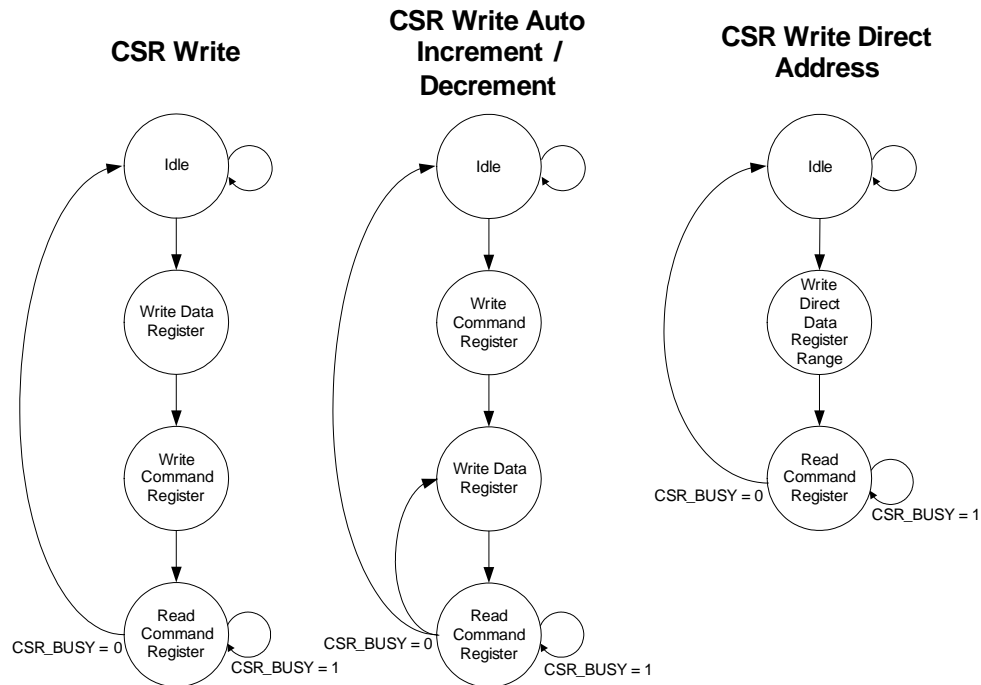

Figure 6.1 Switch Fabric CSR Write Access Flow Diagram

6.2.2 Switch Fabric CSR Reads

To perform a read of an individual switch fabric register, the read cycle must be initiated by performing a single write to the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) with CSR_BUSY (bit 31) set, the CSR_ADDRESS field (bits 15:0) set to the desired register address, the R_nW (bit 30) set, and the AUTO_INC and AUTO_DEC fields cleared. Valid data is available for reading when the CSR_BUSY bit is cleared, indicating that the data can be read from the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#).

A second read method may be used which utilizes the auto increment/decrement function of the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) for reading sequential register addresses. When using this method, the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) must first be written with the auto increment (AUTO_INC) or auto decrement (AUTO_DEC) bit set, the CSR_ADDRESS field written with the desired register address, and the R_nW bit set. The completion of a read cycle is indicated by the clearing of the CSR_BUSY bit, at which time the data can be read from the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#). When the data is read, the address in the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) is incremented or decremented accordingly, and another read cycle is started automatically. The user should clear the AUTO_INC and AUTO_DEC bits before reading the last data to avoid an unintended read cycle.

Figure 6.2 illustrates the process required to perform a switch fabric CSR read.

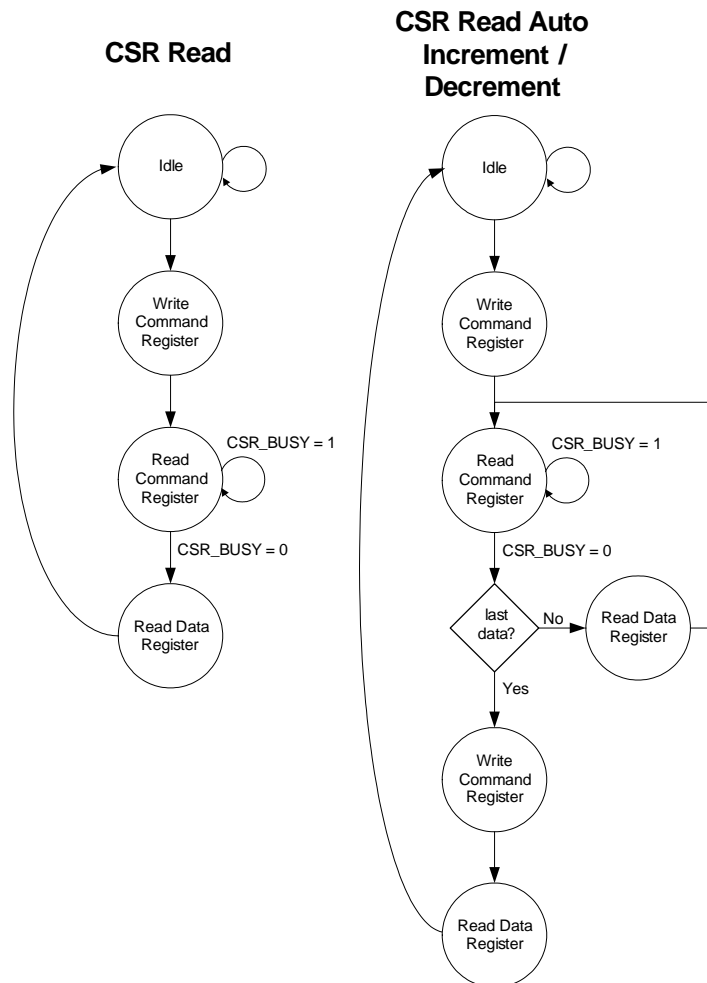

Figure 6.2 Switch Fabric CSR Read Access Flow Diagram

6.2.3 Flow Control Enable Logic

Each switch fabric port (0,1,2) is provided with two flow control enable inputs per port, one for transmission and one for reception. Flow control on transmission allows the transmitter to generate back pressure in half-duplex mode, and pause packets in full-duplex. Flow control in reception enables the reception of pause packets to pause transmissions.

The state of these enables is based on the state of the ports duplex and Auto-negotiation settings and the values of the corresponding Manual Flow Control register ([Port 1 Manual Flow Control Register \(MANUAL_FC_1\)](#), [Port 2 Manual Flow Control Register \(MANUAL_FC_2\)](#), or [Port 0\(External MII\) Manual Flow Control Register \(MANUAL_FC_MII\)](#)). [Table 6.1](#) details the switch fabric flow control enable logic.

When in half-duplex mode, the transmit flow control (back pressure) enable is determined directly by the BP_EN_x bit of the ports manual flow control register. When Auto-negotiation is disabled, or the MANUAL_FC_x bit of the ports manual flow control register is set, the switch port flow control enables during full-duplex are determined by the TX_FC_x and RX_FC_x bits of the ports manual flow control

Datasheet

register. When Auto-negotiation is enabled and the MANUAL_FC_x bit is cleared, the switch port flow control enables during full-duplex are determined by Auto-negotiation.

Note: The flow control values in the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) and [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) are not affected by the values of the manual flow control register. Refer to [Section 7.2.5.1, "PHY Pause Flow Control," on page 94](#) and [Section 7.3.1.3, "Virtual PHY Pause Flow Control," on page 99](#) for additional information on PHY and Virtual PHY flow control settings respectively.

Table 6.1 Switch Fabric Flow Control Enable Logic

CASE	MANUAL_FC_X	AN ENABLE	AN COMPLETE	LP AN ABLE	DUPLEX	AN PAUSE ADVERTISEMENT (Note 6.2)	AN ASYM PAUSE ADVERTISEMENT (Note 6.2)	LP PAUSE ABILITY (Note 6.2)	LP ASYM PAUSE ABILITY (Note 6.2)	RX FLOW CONTROL ENABLE	RX FLOW CONTROL ENABLE
-	1	X	X	X	Half	X	X	X	X	0	BP_EN_x
-	X	0	X	X	Half	X	X	X	X	0	BP_EN_x
-	1	X	X	X	Full	X	X	X	X	RX_FC_x	TX_FC_x
-	X	0	X	X	Full	X	X	X	X	RX_FC_x	TX_FC_x
1	0	1	0	X	X	X	X	X	X	0	0
2	0	1	1	0	Half (Note 6.1)	X	X	X	X	0	BP_EN_x
3	0	1	1	1	Half	X	X	X	X	0	BP_EN_x
4	0	1	1	1	Full	0	0	X	X	0	0
5	0	1	1	1	Full	0	1	0	X	0	0
6	0	1	1	1	Full	0	1	1	0	0	0
7	0	1	1	1	Full	0	1	1	1	0	1
8	0	1	1	1	Full	1	0	0	X	0	0
9	0	1	1	1	Full	1	X	1	X	1	1
10	0	1	1	1	Full	1	1	0	0	0	0
11	0	1	1	1	Full	1	1	0	1	1	0

Note 6.1 If Auto-negotiation is enabled and complete, but the link partner is not Auto-negotiation capable, half-duplex is forced via the parallel detect function.

Note 6.2 For the Port 1 and Port 2 PHYs, these are the bits from the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) and [Port x PHY Auto-Negotiation Link Partner Base Page Ability Register \(PHY_AN_LP_BASE_ABILITY_x\)](#). For the Virtual PHY, these are the local/partner swapped outputs from the bits in the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) and [Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register \(VPHY_AN_LP_BASE_ABILITY\)](#). Refer to [Section 7.3.1, "Virtual PHY Auto-Negotiation," on page 98](#) for more information.

Per [Table 6.1](#), the following cases are possible:

- **Case 1** - Auto-negotiation is still in progress. Since the result is not yet established, flow control is disabled.
- **Case 2** - Auto-negotiation is enabled and unsuccessful (link partner not Auto-negotiation capable). The link partner ability is undefined, effectively a don't-care value, in this case. The duplex setting will default to half-duplex in this case. Flow control is determined by the BP_EN_x bit.
- **Case 3** - Auto-negotiation is enabled and successful with half-duplex as a result. The link partner ability is undefined since it only applies to full-duplex operation. Flow control is determined by the BP_EN_x bit.
- **Cases 4-11** -Auto-negotiation is enabled and successful with full-duplex as the result. In these cases, the advertisement registers and the link partner ability controls the RX and TX enables. These cases match IEEE 802.3 Annex 28B.3.
 - **Cases 4,5,6,8,10** - No flow control enabled
 - **Case 7** - Asymmetric pause towards partner (away from switch port)
 - **Case 9** - Symmetric pause
 - **Case 11** - Asymmetric pause from partner (towards switch port)

6.3 10/100 Ethernet MACs

The switch fabric contains three 10/100 MAC blocks, one for each switch port (0,1,2). The 10/100 MAC provides the basic 10/100 Ethernet functionality, including transmission deferral and collision back-off/retry, receive/transmit FCS checking and generation, receive/transmit pause flow control, and transmit back pressure. The 10/100 MAC also includes RX and TX FIFOs and per port statistic counters.

6.3.1 Receive MAC

The receive MAC (IEEE 802.3) sublayer decomposes Ethernet packets acquired via the internal MII interface by stripping off the preamble sequence and Start of Frame Delimiter (SFD). The receive MAC checks the FCS, the MAC Control Type, and the byte count against the drop conditions. The packet is stored in the RX FIFO as it is received.

The receive MAC determines the validity of each received packet by checking the Type field, FCS, and oversize or undersize conditions. All bad packets will be either immediately dropped or marked (at the end) as bad packets.

Oversized packets are normally truncated at 1519 or 1523 (VLAN tagged) octets and marked as erroneous. The MAC can be configured to accept packets up to 2048 octets (inclusive), in which case the oversize packets are truncated at 2048 bytes and marked as erroneous.

Undersized packets are defined as packets with a length less than the minimum packet size. The minimum packet size is defined to be 64 bytes, exclusive of preamble sequence and SFD.

The FCS and length/type fields of the frame is checked to detect if the packet has a valid MAC control frame. When the MAC receives a MAC control frame with a valid FCS and determines the operation code is a pause command (Flow Control frame), the MAC will load its internal pause counter with the Number_of_Slots variable from the MAC control frame just received. Anytime the internal pause counter is zero, the transmit MAC will be allowed to transmit (XON). If the internal pause counter is not zero, the receive MAC will not allow the transmit MAC to transmit (XOFF). When the transmit MAC detects an XOFF condition it will continue to transmit the current packet, terminating transmission after the current packet has been transmitted until receiving the XON condition from the receive MAC. The pause counter will begin to decrement at then end of the current transmission, or immediately if no transmission is underway. If another pause command is received while the transmitter is already in pause, the new pause time indicated by the Flow Control packet will be loaded into the pause counter. The pause function is enabled by either Auto-negotiation, or manually as discussed in [Section 6.2.3](#),

Datasheet

"Flow Control Enable Logic," on page 60. Pause frames are consumed by the MAC and not sent to the switch engine. Non-pause control frames are optionally filtered or forwarded.

When the receive FIFO is full and additional data continues to be received, an overrun condition occurs and the frame is discarded (FIFO space recovered) or marked as a bad frame.

The receive MAC can be disabled from receiving all frames by clearing the RX Enable bit of the [Port x MAC Receive Configuration Register \(MAC_RX_CFG_x\)](#).

The size of the RX FIFO is 256 bytes. If a bad packet with less than 64 bytes is received, it will be flushed from the FIFO automatically and the FIFO space recovered. Packets equal to or larger than 64 bytes with an error will be marked and reported to the switch engine. The switch engine will subsequently drop the packet.

6.3.1.1 Receive Counters

The receive MAC gathers statistics on each packet and increments the related counter registers. The following receive counters are supported for each switch fabric port. Refer to [Table 13.12, "Indirectly Accessible Switch Control and Status Registers,"](#) on page 253 and [Section 13.3.2.3](#) through [Section 13.3.2.22](#) for detailed descriptions of these counters.

- Total undersized packets ([Section 13.3.2.3, on page 270](#))
- Total packets 64 bytes in size ([Section 13.3.2.4, on page 271](#))
- Total packets 65 through 127 bytes in size ([Section 13.3.2.5, on page 272](#))
- Total packets 128 through 255 bytes in size ([Section 13.3.2.6, on page 273](#))
- Total packets 256 through 511 bytes in size ([Section 13.3.2.7, on page 274](#))
- Total packets 512 through 1023 bytes in size ([Section 13.3.2.8, on page 275](#))
- Total packets 1024 through maximum bytes in size ([Section 13.3.2.9, on page 276](#))
- Total oversized packets ([Section 13.3.2.10, on page 277](#))
- Total OK packets ([Section 13.3.2.11, on page 278](#))
- Total packets with CRC errors ([Section 13.3.2.12, on page 279](#))
- Total multicast packets ([Section 13.3.2.13, on page 280](#))
- Total broadcast packets ([Section 13.3.2.14, on page 281](#))
- Total MAC Pause packets ([Section 13.3.2.15, on page 282](#))
- Total fragment packets ([Section 13.3.2.16, on page 283](#))
- Total jabber packets ([Section 13.3.2.17, on page 284](#))
- Total alignment errors ([Section 13.3.2.18, on page 285](#))
- Total bytes received from all packets ([Section 13.3.2.19, on page 286](#))
- Total bytes received from good packets ([Section 13.3.2.20, on page 287](#))
- Total packets with a symbol error ([Section 13.3.2.21, on page 288](#))
- Total MAC control packets ([Section 13.3.2.22, on page 289](#))

6.3.2 Transmit MAC

The transmit MAC generates an Ethernet MAC frame from TX FIFO data. This includes generating the preamble and SFD, calculating and appending the frame checksum value, optionally padding undersize packets to meet the minimum packet requirement size (64 bytes), and maintaining a standard inter-frame gap time during transmit.

The transmit MAC can operate at 10/100Mbps, half- or full-duplex, and with or without flow control depending on the state of the transmission. In half-duplex mode the transmit MAC meets CSMA/CD IEEE 802.3 requirements. The transmit MAC will re-transmit if collisions occur during the first 64 bytes (normal collisions), or will discard the packet if collisions occur after the first 64 bytes (late collisions). The transmit MAC follows the standard truncated binary exponential back-off algorithm, collision and jamming procedures.

The transmit MAC pre-pends the standard preamble and SFD to every packet from the FIFO. The transmit MAC also follows as default, the standard Inter-Frame Gap (IFG). The default IFG is 96 bit times and can be adjusted via the IFG Config field of the [Port x MAC Transmit Configuration Register \(MAC_TX_CFG_x\)](#).

Packet padding and cyclic redundant code (FCS) calculation may be optionally performed by the transmit MAC. The auto-padding process automatically adds enough zeros to packets shorter than 64 bytes. The auto-padding and FCS generation is controlled via the TX Pad Enable bit of the [Port x MAC Transmit Configuration Register \(MAC_TX_CFG_x\)](#).

The transmit FIFO acts as a temporary buffer between the transmit MAC and the switch engine. The FIFO logic manages the re-transmission for normal collision conditions or discards the frames for late or excessive collisions.

When in full-duplex mode, the transmit MAC uses the flow-control algorithm specified in IEEE 802.3. MAC pause frames are used primarily for flow control packets, which pass signalling information between stations. MAC pause frames have a unique type of 8808h, and a pause op-code of 0001h. The MAC pause frame contains the pause value in the data field. The flow control manager will auto-adapt the procedure based on traffic volume and speed to avoid packet loss and unnecessary pause periods.

When in half-duplex mode, the MAC uses a back pressure algorithm. The back pressure algorithm is based on a forced collision and an aggressive back-off algorithm.

6.3.2.1 Transmit Counters

The transmit MAC gathers statistics on each packet and increments the related counter registers. The following transmit counters are supported for each switch fabric port. Refer to [Table 13.12, "Indirectly Accessible Switch Control and Status Registers,"](#) on page 253 and [Section 13.3.2.25](#) through [Section 13.3.2.42](#) for detailed descriptions of these counters.

- Total packets deferred ([Section 13.3.2.25, on page 292](#))
- Total pause packets ([Section 13.3.2.26, on page 293](#))
- Total OK packets ([Section 13.3.2.27, on page 294](#))
- Total packets 64 bytes in size ([Section 13.3.2.28, on page 295](#))
- Total packets 65 through 127 bytes in size ([Section 13.3.2.29, on page 296](#))
- Total packets 128 through 255 bytes in size ([Section 13.3.2.30, on page 297](#))
- Total packets 256 through 511 bytes in size ([Section 13.3.2.31, on page 298](#))
- Total packets 512 through 1023 bytes in size ([Section 13.3.2.32, on page 299](#))
- Total packets 1024 through maximum bytes in size ([Section 13.3.2.33, on page 300](#))
- Total undersized packets ([Section 13.3.2.34, on page 301](#))
- Total bytes transmitted from all packets ([Section 13.3.2.35, on page 302](#))
- Total broadcast packets ([Section 13.3.2.36, on page 303](#))

Datasheet

- Total multicast packets ([Section 13.3.2.37, on page 304](#))
- Total packets with a late collision ([Section 13.3.2.38, on page 305](#))
- Total packets with excessive collisions ([Section 13.3.2.39, on page 306](#))
- Total packets with a single collision ([Section 13.3.2.40, on page 307](#))
- Total packets with multiple collisions ([Section 13.3.2.41, on page 308](#))
- Total collision count ([Section 13.3.2.42, on page 309](#))

6.4 Switch Engine (SWE)

The switch engine (SWE) is a VLAN layer 2 (link layer) switching engine supporting 3 ports. The SWE supports the following types of frame formats: untagged frames, VLAN tagged frames, and priority tagged frames. The SWE supports both the 802.3 and Ethernet II frame formats.

The SWE provides the control for all forwarding/filtering rules. It handles the address learning and aging, and the destination port resolution based upon the MAC address and VLAN of the packet. The SWE implements the standard bridge port states for spanning tree and provides packet metering for input rate control. It also implements port mirroring, broadcast throttling, and multicast pruning and filtering. Packet priorities are supported based on the IPv4 TOS bits and IPv6 Traffic Class bits using a DIFFSERV Table mapping, the non-DIFFSERV mapped IPv4 precedence bits, VLAN priority using a per port Priority Regeneration Table, DA based static priority, and Traffic Class mapping to one of 4 QoS transmit priority queues.

The following sections detail the various features of the switch engine.

6.4.1 MAC Address Lookup Table

The Address Logic Resolution (ALR) maintains a 1024 entry MAC Address Table. The ALR searches the table for the destination MAC address. If the search finds a match, the associated data is returned indicating the destination port or ports, whether to filter the packet, the packets priority (used if enabled), and whether to override the ingress and egress spanning tree port state. [Figure 6.3](#) displays the ALR table entry structure. Refer to the [Switch Engine ALR Write Data 0 Register \(SWE_ALR_WR_DAT_0\)](#) and [Switch Engine ALR Write Data 1 Register \(SWE_ALR_WR_DAT_1\)](#) for detailed descriptions of these bits.

Bit	56	55	54	53	52	51	50	49	48	47	...	0
	Valid	Age / Override	Static	Filter	Priority			Port				MAC Address

Figure 6.3 ALR Table Entry Structure

6.4.1.1 Learning/Aging/Migration

The ALR adds new MAC addresses upon ingress along with the associated receive port.

If the source MAC address already exists, the entry is refreshed. This action serves two purposes. First, if the source port has changed due to a network reconfiguration (migration), it is updated. Second, each instance the entry is refreshed, the aging status bit is set, keeping the entry active. Learning can be disabled per port via the Enable Learning on Ingress field of the [Switch Engine Port Ingress Configuration Register \(SWE_PORT_INGRSS_CFG\)](#).

During each aging period, the ALR scans the learned MAC addresses. For entries which have the aging status bit set, the ALR simply clears the bit. As mentioned above, if a MAC address is subsequently refreshed, the aging bit will be set again and the process would repeat. If a learned entry already had its aging status bit cleared (by a previous scan), the ALR will instead remove the learned entry. Therefore, if two scans occur before a MAC address is refreshed, the entry will be aged and removed. Each aging period is approximately 5 minutes. Therefore an entry will be aged and removed at a minimum of 5 minutes, and a maximum of 10 minutes.

6.4.1.2 Static Entries

If a MAC address entry is manually added by the host CPU, it can be (and typically is) marked as static. Static entries are not subjected to the aging process. Static entries also cannot be changed by the learning process (including migration).

6.4.1.3 Multicast Pruning

The destination port that is returned as a result of a destination MAC address lookup may be a single port or any combination of ports. The latter is used to setup multicast address groups. An entry with a multicast MAC address would be entered manually by the host CPU with the appropriate destination port(s). Typically, the Static bit should also be set to prevent automatic aging of the entry.

6.4.1.4 Address Filtering

Filtering can be performed on a destination MAC address. Such an entry would be entered manually by the host CPU with the Filter bit active. Typically, the Static bit should also be set to prevent automatic aging of the entry.

6.4.1.5 Spanning Tree Port State Override

A special spanning tree port state override setting can be applied to MAC address entries. When the host CPU manually adds an entry with both the Static and Age bits set, packets with a matching destination address will bypass the spanning tree port state and will be forwarded. This feature is typically used to allow the reception of the BPDU packets while a port is in the non-forwarding state. Refer to [Section 6.4.5, "Spanning Tree Support," on page 72](#) for additional details.

6.4.1.6 MAC Destination Address Lookup Priority

If enabled in the [Switch Engine Global Ingress Configuration Register \(SWE_GLOBAL_INGRSS_CFG\)](#), the transmit priority for static MAC address entries is taken from the associated data of that entry.

6.4.1.7 Host Access

The ALR contains a learning engine that is used by the host CPU to add, delete, and modify the MAC Address Table. This engine is accessed by using the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#), [Switch Engine ALR Command Status Register \(SWE_ALR_CMD_STS\)](#), [Switch Engine ALR Write Data 0 Register \(SWE_ALR_WR_DAT_0\)](#), and [Switch Engine ALR Write Data 1 Register \(SWE_ALR_WR_DAT_1\)](#).

Datasheet

The following procedure should be followed in order to add, delete, and modify the ALR entries:

1. Write the [Switch Engine ALR Write Data 0 Register \(SWE_ALR_WR_DAT_0\)](#) and [Switch Engine ALR Write Data 1 Register \(SWE_ALR_WR_DAT_1\)](#) with the desired MAC address and control bits.
Note:An entry can be deleted by setting the Valid and Static bits to 0.
2. Write the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#) register with 0004h (Make Entry)
3. Poll the Make Pending bit in the [Switch Engine ALR Command Status Register \(SWE_ALR_CMD_STS\)](#) until it is cleared.
4. Write the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#) with 0000h.

The ALR contains a search engine that is used by the host to read the MAC Address Table. This engine is accessed by using the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#), [Switch Engine ALR Read Data 0 Register \(SWE_ALR_RD_DAT_0\)](#), and [Switch Engine ALR Read Data 1 Register \(SWE_ALR_RD_DAT_1\)](#).

Note: The entries read are not necessarily in the same order as they were learned or manually added.

The following procedure should be followed in order to read the ALR entries:

1. Write the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#) with 0002h (Get First Entry).
2. Write the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#) with 0000h (Clear the Get First Entry Bit)
3. Poll the Valid and End of Table bits in the [Switch Engine ALR Read Data 1 Register \(SWE_ALR_RD_DAT_1\)](#) until either are set.
4. If the Valid bit is set, then the entry is valid and the data from the [Switch Engine ALR Read Data 0 Register \(SWE_ALR_RD_DAT_0\)](#) and [Switch Engine ALR Read Data 1 Register \(SWE_ALR_RD_DAT_1\)](#) can be stored.
5. If the End of Table bit is set, then exit.
6. Write the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#) with 0001h (Get Next Entry).
7. Write the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#) with 0000h (Clear the Get Next Entry bit)
8. Go to step 3.

Note: Refer to [Section 13.3.3.1, on page 312](#) through [Section 13.3.3.6, on page 319](#) for detailed definitions of these registers.

6.4.2 Forwarding Rules

Upon ingress, packets are filtered or forwarded based on the following rules:

- If the destination port equals the source port (local traffic), the packet is filtered.
- If the source port is not in the forwarding state, the packet is filtered (unless the [Spanning Tree Port State Override](#) is in effect).
- If the destination port is not in the forwarding state, the packet is filtered (unless the [Spanning Tree Port State Override](#) is in effect).
- If the Filter bit for the Destination Address is set in the ALR table, the packet is filtered.
- If the packet has a unicast destination MAC address which is not found in the ALR table and the Drop Unknown bit is set, the packet is filtered.
- If the packet has a multicast destination MAC address which is not found in the ALR table and the Filter Multicast bit is set, the packet is filtered.
- If the packet has a broadcast destination MAC address and the Broadcast Storm Control level has been reached, the packet is discarded.
- If Drop on Yellow is set, the packet is colored Yellow, and randomly selected, it is discarded.
- If Drop on Red is set and the packet is colored Red, it is discarded.
- If the destination address was not found in the ALR table (an unknown or a broadcast) and the Broadcast Buffer Level is exceeded, the packet is discarded.
- If there is insufficient buffer space, the packet is discarded.

When the switch is enabled for VLAN support, these following rules also apply:

- If the packet is untagged or priority tagged and the Admit Only VLAN bit for the ingress port is set, the packet is filtered.
- If the packet is tagged and has a VID equal to FFFh, it is filtered.
- If Enable Membership Checking on Ingress is set, Admit Non Member is cleared, and the source port is not a member of the incoming VLAN, the packet is filtered.
- If Enable Membership Checking on Ingress is set and the destination port is not a member of the incoming VLAN, the packet is filtered.
- If the destination address was not found in the ALR table (as unknown or broadcast) and the VLAN broadcast domain containment resulted in zero valid destination ports, the packet is filtered.

Note: For the last three cases, if the VID is not in the VLAN table, the VLAN is considered foreign and the membership result is NULL. A NULL membership will result in the packet being filtered if Enable Membership Checking is set. A NULL membership will also result in the packet being filtered if the destination address is not found in the ALR table (since the packet would have no destinations).

Datasheet

6.4.3 Transmit Priority Queue Selection

The transmit priority queue may be selected from five options. As shown in [Figure 6.4](#), the priority may be based on:

- the static value for the destination address in the ALR table
- the precedence bits in the IPv4 TOS octet
- the DIFFSERV mapping table indexed by the IPv4 TOS octet or the IPv6 Traffic Class octet
- the VLAN tag priority field using the per port Priority Regeneration table
- the port default

The last four options listed are sent through the Traffic Class table which maps the selected priority to one of the four output queues. The static value from the ALR table directly specifies the queue.

Figure 6.4 Switch Engine Transmit Queue Selection

The transmit queue priority is based on the packet type and device configuration as shown in Figure 6.5. Refer to Section 13.3.3.16, "Switch Engine Global Ingress Configuration Register (SWE_GLOBAL INGRSS_CFG)," on page 329 for definitions of the configuration bits.

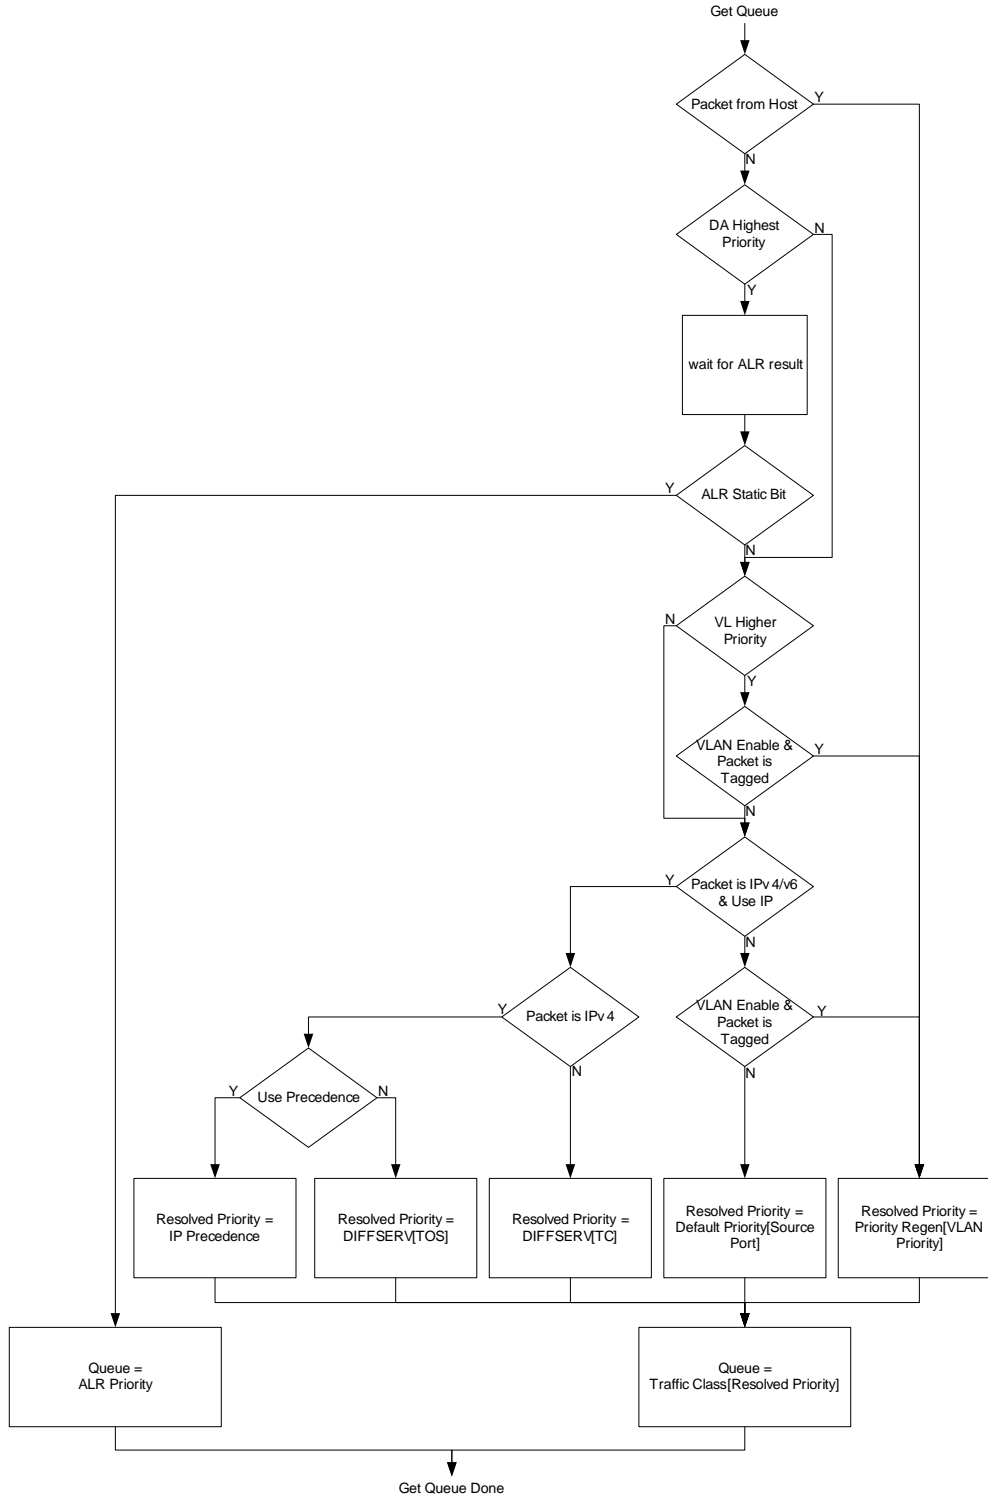

Figure 6.5 Switch Engine Transmit Queue Calculation

Datasheet

6.4.3.1 Port Default Priority

As detailed in [Figure 6.5](#), the default priority is based on the ingress ports priority bits in its port VID value. The PVID table is read and written by using the [Switch Engine VLAN Command Register \(SWE_VLAN_CMD\)](#), [Switch Engine VLAN Write Data Register \(SWE_VLAN_WR_DATA\)](#), [Switch Engine VLAN Read Data Register \(SWE_VLAN_RD_DATA\)](#), and [Switch Engine VLAN Command Status Register \(SWE_VLAN_CMD_STS\)](#). Refer to [Section 13.3.3.8, on page 321](#) through [Section 13.3.3.11, on page 324](#) for detailed VLAN register descriptions.

6.4.3.2 IP Precedence Based Priority

The transmit priority queue can be chosen based on the Precedence bits of the IPv4 TOS octet. This is supported for tagged and non-tagged packets for both type field and length field encapsulations. The Precedence bits are the three most significant bits of the IPv4 TOS octet.

6.4.3.3 DIFFSERV Based Priority

The transmit priority queue can be chosen based on the DIFFSERV usage of the IPv4 TOS or IPv6 Traffic Class octet. This is supported for tagged and non-tagged packets for both type field and length field encapsulations.

The DIFFSERV table is used to determine the packet priority from the 6-bit Differentiated Services (DS) field. The DS field is defined as the six most significant bits of the IPv4 TOS octet or the IPv6 Traffic Class octet and is used as an index into the DIFFSERV table. The output of the DIFFSERV table is then used as the priority. This priority is then passed through the Traffic Class table to select the transmit priority queue.

Note: The DIFFSERV table is not initialized upon reset or power-up. If DIFFSERV is enabled, then the full table must be initialized by the host.

The DIFFSERV table is read and written by using the [Switch Engine DIFFSERV Table Command Register \(SWE_DIFFSERV_TBL_CFG\)](#), [Switch Engine DIFFSERV Table Write Data Register \(SWE_DIFFSERV_TBL_WR_DATA\)](#), [Switch Engine DIFFSERV Table Read Data Register \(SWE_DIFFSERV_TBL_RD_DATA\)](#), and [Switch Engine DIFFSERV Table Command Status Register \(SWE_DIFFSERV_TBL_CMD_STS\)](#). Refer to [Section 13.3.3.12, on page 325](#) through [Section 13.3.3.15, on page 328](#) for detailed DIFFSERV register descriptions.

6.4.3.4 VLAN Priority

As detailed in [Figure 6.5](#), the transmit priority queue can be taken from the priority field of the VLAN tag. The VLAN priority is sent through a per port Priority Regeneration table, which is used to map the VLAN priority into a user defined priority.

The Priority Regeneration table is programmed by using the [Switch Engine Port 0 Ingress VLAN Priority Regeneration Table Register \(SWE INGRSS_REGEN_TBL_MII\)](#), [Switch Engine Port 1 Ingress VLAN Priority Regeneration Table Register \(SWE INGRSS_REGEN_TBL_1\)](#), and [Switch Engine Port 2 Ingress VLAN Priority Regeneration Table Register \(SWE INGRSS_REGEN_TBL_2\)](#). Refer to [Section 13.3.3.33, on page 348](#) through [Section 13.3.3.35, on page 350](#) for detailed descriptions of these registers.

6.4.4 VLAN Support

The switch engine supports 16 active VLANs out of a possible 4096. The VLAN table contains the 16 active VLAN entries, each consisting of the VID, the port membership, and un-tagging instructions.

17	16	15	14	13	12	11	...	0
Member Port 2	Un-tag Port 2	Member Port 1	Un-tag Port 1	Member MII	Un-tag MII	VID		

Figure 6.6 VLAN Table Entry Structure

On ingress, if a packet has a VLAN tag containing a valid VID (not 000h or FFFh), the VID table is searched. If the VID is found, the VLAN is considered active and the membership and un-tag instruction is used. If the VID is not found, the VLAN is considered foreign and the membership result is NULL. A NULL membership will result in the packet being filtered if Enable Membership Checking is set. A NULL membership will also result in the packet being filtered if the destination address is not found in the ALR table (since the packet would have no destinations).

On ingress, if a packet does not have a VLAN tag or if the VLAN tag contains VID with a value of 0 (priority tag), the packet is assigned a VLAN based on the Port Default VID (PVID) and Priority. The PVID is then used to access the above VLAN table.

The VLAN membership of the packet is used for ingress and egress checking and for VLAN broadcast domain containment. The un-tag instructions are used at egress on ports defined as hybrid ports.

Refer to [Section 13.3.3.8, on page 321](#) through [Section 13.3.3.11, on page 324](#) for detailed VLAN register descriptions.

6.4.5 Spanning Tree Support

Hardware support for the Spanning Tree Protocol (STP) and the Rapid Spanning Tree Protocol (RSTP) includes a per port state register as well as the override bit in the MAC Address Table entries ([Section 6.4.1.5, on page 66](#)) and the host CPU port special tagging ([Section 6.4.10, on page 77](#)).

The [Switch Engine Port State Register \(SWE_PORT_STATE\)](#) is used to place a port into one of the modes as shown in [Table 6.2](#). Normally only Port 1 and Port 2 are placed into modes other than forwarding. Port 0 should normally be left in forwarding mode.

Table 6.2 Spanning Tree States

Port State	Hardware Action	Software Action
01 - Blocking (also used for disabled)	Received packets on the port are discarded. Transmissions to the port are blocked. Learning on the port is disabled.	The MAC Address Table should be programmed with entries that the host CPU needs to receive (e.g. the BPDU address). The static and override bits should be set. The host CPU should not send any packets to the port in this state. The host CPU should discard received packets from this port when in the Disabled state. Note: There is no hardware distinction between the Blocking and Disabled states.

Table 6.2 Spanning Tree States (continued)

Port State	Hardware Action	Software Action
11 - Listening	<p>Received packets on the port are discarded.</p> <p>Transmissions to the port are blocked.</p> <p>Learning on the port is disabled.</p>	<p>The MAC Address Table should be programmed with entries that the host CPU needs to receive (e.g. the BPDU address). The static and override bits should be set.</p> <p>The host CPU may send packets to the port in this state.</p>
10 - Learning	<p>Received packets on the port are discarded.</p> <p>Transmissions to the port are blocked.</p> <p>Learning on the port is enabled.</p>	<p>The MAC Address Table should be programmed with entries that the host CPU needs to receive (e.g. the BPDU address). The static and override bits should be set.</p> <p>The host CPU may send packets to the port in this state.</p>
00 - Forwarding	<p>Received packets on the port are forwarded normally.</p> <p>Transmissions to the port are sent normally.</p> <p>Learning on the port is enabled.</p>	<p>The MAC Address Table should be programmed with entries that the host CPU needs to receive (e.g. the BPDU address). The static and override bits should be set.</p> <p>The host CPU may send packets to the port in this state.</p>

6.4.6 Ingress Flow Metering and Coloring

The LAN9313/LAN9313i supports hardware ingress rate limiting by metering packet streams and marking packets as either Green, Yellow, or Red according to three traffic parameters: Committed Information Rate (CIR), Committed Burst Size (CBS), and Excess Burst Size (EBS). A packet is marked Green if it does not exceed the CBS, Yellow if it exceeds to CBS but not the EBS, or Red otherwise.

Ingress flow metering and coloring is enabled via the Ingress Rate Enable bit in the [Switch Engine Ingress Rate Configuration Register \(SWE_INGRSS_RATE_CFG\)](#). Once enabled, each incoming packet is classified into a stream. Streams are defined as per port (3 streams), per priority (8 streams), or per port & priority (24 streams) as selected via the Rate Mode bits in the [Switch Engine Ingress Rate Configuration Register \(SWE_INGRSS_RATE_CFG\)](#). Each stream can have a different CIR setting. All streams share common CBS and EBS settings. CIR, CBS, and EBS are programmed via the [Switch Engine Ingress Rate Command Register \(SWE_INGRSS_RATE_CMD\)](#) and [Switch Engine Ingress Rate Write Data Register \(SWE_INGRSS_RATE_WR_DATA\)](#).

Each stream is metered according to RFC 2697. At the rate set by the CIR, two token buckets are credited per stream. First, the Committed Burst bucket is incremented up to the maximum set by the CBS. Once the Committed Burst bucket is full, the Excess Burst bucket is incremented up to the maximum set by the EBS. The CIR rate is specified in time per byte. The value programmed is in approximately 20 nS per byte increments. Typical values are listed in [Table 6.3](#). When a port is receiving at 10Mbps, any setting faster than 39 has the effect of not limiting the rate.

Table 6.3 Typical Ingress Rate Settings

CIR Setting	Time Per Byte	Bandwidth
0-3	80 nS	100 Mbps
4	100 nS	80 Mbps
5	120 nS	67 Mbps
6	140 nS	57 Mbps
7	160 nS	50 Mbps
9	200 nS	40 Mbps
12	260 nS	31 Mbps
19	400 nS	20 Mbps
39	800 nS	10 Mbps
79	1600 nS	5 Mbps
160	3220 nS	2.5 Mbps
402	8060 nS	1 Mbps
804	16100 nS	500 Kbps
1610	32220 nS	250 Kbps
4028	80580 nS	100 Kbps
8056	161140 nS	50 Kbps

After each packet is received, the bucket is decremented. If the Committed Burst bucket has sufficient tokens, it is debited and the packet is colored Green. If the Committed Burst bucket lacks sufficient tokens for the packet, the Excess Burst bucket is checked. If the Excess Burst bucket has sufficient tokens, it is debited, the packet is colored Yellow and is subjected to random discard. If the Excess Burst bucket lacks sufficient tokens for the packet, the packet is colored Red and is discarded.

Note: All of the token buckets are initialized to the default value of 1536. If lower values are programmed into the CBS and EBS parameters, the token buckets will need to be normally depleted below these values before the values have any affect on limiting the maximum value of the token buckets.

Refer to [Section 13.3.3.25, on page 339](#) through [Section 13.3.3.29, on page 344](#) for detailed register descriptions.

6.4.6.1 Ingress Flow Calculation

Based on the flow monitoring mode, an ingress flow definition can include the ingress priority. This is calculated similarly to the transmit queue with the exception that the Priority Regeneration and the Traffic Class table are not used. As shown in [Figure 6.7](#), the priority can be based on:

- The precedence bits in the IPv4 TOS octet
- The DIFFSERV mapping table indexed by the IPv4 TOS octet or the IPv6 Traffic Class octet
- The VLAN tag priority field (but not through the per port Priority Regeneration table)
- The port default

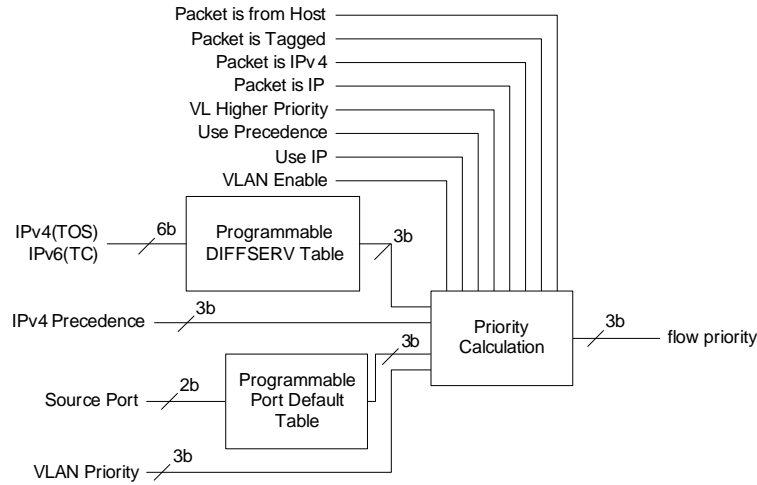

Figure 6.7 Switch Engine Ingress Flow Priority Selection

The ingress flow calculation is based on the packet type and the device configuration as shown in Figure 6.8.

Figure 6.8 Switch Engine Ingress Flow Priority Calculation

6.4.7 Broadcast Storm Control

In addition to ingress rate limiting, the LAN9313/LAN9313i supports hardware broadcast storm control on a per port basis. This feature is enabled via the [Switch Engine Broadcast Throttling Register \(SWE_BCST_THROT\)](#). The allowed rate per port is specified as the number of bytes multiplied by 64 allowed to be received every 1.72 mS interval. Packets that exceed this limit are dropped. Typical values are listed in [Table 6.4](#). When a port is receiving at 10Mbps, any setting above 34 has the effect of not limiting the rate.

Table 6.4 Typical Broadcast Rate Settings

Broadcast Throttle Level	Bandwidth
252	75 Mbps
168	50 Mbps
134	40 Mbps
67	20 Mbps
34	10 Mbps
17	5 Mbps
8	2.4 Mbps
4	1.2 Mbps
3	900 Kbps
2	600 Kbps
1	300 Kbps

In addition to the rate limit, the [Buffer Manager Broadcast Buffer Level Register \(BM_BCST_LVL\)](#) specifies the maximum number of buffers that can be used by broadcasts, multicasts, and unknown unicasts.

6.4.8 IPv4 IGMP / IPv6 MLD Support

The LAN9313/LAN9313i provides Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) hardware support using two mechanisms: IGMP/MLD snooping and Multicast Pruning.

On ingress, if IGMP packet snooping is enabled in the [Switch Engine Global Ingress Configuration Register \(SWE_GLOBAL INGRSS_CFG\)](#), IGMP *multicast* packets are trapped and redirected to the MLD/IGMP snoop port (typically set to the port to which the host CPU is connected). IGMP packets are identified as IPv4 packets with a protocol of 2. Both Ethernet and IEEE 802.3 frame formats are supported as are VLAN tagged packets.

On ingress, if MLD packet snooping is enabled in the [Switch Engine Global Ingress Configuration Register \(SWE_GLOBAL INGRSS_CFG\)](#), MLD *multicast* packets are trapped and redirected to the MLD/IGMP snoop port (typically set to the port to which the host CPU is connected). MLD packets are identified as IPv6 packets with a next header value of 58 decimal (ICMPv6). Both Ethernet and IEEE 802.3 frame formats are supported as are VLAN tagged packets.

Once the IGMP or MLD packets are received by the host CPU, the host software can decide which port or ports need to be members of the multicast group. This group is then added to the ALR table as detailed in [Section 6.4.1.3, "Multicast Pruning," on page 66](#). The host software should also forward the original IGMP packet if necessary.

Datasheet

Normally, packets are never transmitted back to the receiving port. For IGMP/MLD snooping, this may optionally be enabled via the [Switch Engine Global Ingress Configuration Register \(SWE_GLOBAL_INGRSS_CFG\)](#). This function would be used if the snooping port wished to participate in the IGMP/MLD group without the need to perform special handling in the transmit portion of the driver software.

Note: Most forwarding rules are skipped when a packet is snooped. However, a packet is still filtered if:

- The source port is not in the forwarding state (unless Spanning Tree Port State Override is in effect).
- VLAN's are enabled, the packet is untagged or priority tagged, and the Admit Only VLAN bit for the ingress port is set.
- VLAN's are enabled and the packet is tagged and had a VID equal to FFFh.
- VLAN's are enabled, Enabled Membership Checking on Ingress is set, Admit Non Member is cleared, and the source port is not a member of the incoming VLAN.

6.4.9 Port Mirroring

The LAN9313/LAN9313i supports port mirroring where packets received or transmitted on a port or ports can also be copied onto another “sniffer” port.

Port mirroring is configured using the [Switch Engine Port Mirroring Register \(SWE_PORT_MIRROR\)](#). Multiple mirrored ports can be defined, but only one sniffer port can be defined.

When receive mirroring is enabled, packets that are forwarded from a port designated as a mirrored port are also transmitted by the sniffer port. For example, Port 2 is setup to be a mirrored port and Port 0 is setup to be the sniffer port. If a packet is received on Port 2 with a destination of Port 1, it is forwarded to both Port 1 and Port 0.

When transmit mirroring is enabled, packets that are forwarded to a port designated as a mirrored port are also transmitted by the sniffer port. For example, Port 2 is setup to be a mirrored port and Port 0 is setup to be the sniffer port. If a packet is received on Port 1 with a destination of Port 2, it is forwarded to both Port 2 and Port 0.

Note: A packet will never be transmitted out of the receiving port. A receive packet is not normally mirrored if it is filtered. This can optionally be enabled.

6.4.10 Host CPU Port Special Tagging

The [Switch Engine Ingress Port Type Register \(SWE_INGRSS_PORT_TYP\)](#) and [Buffer Manager Egress Port Type Register \(BM_EGRSS_PORT_TYPE\)](#) are used to enable a special VLAN tag that is used by the host CPU. This special tag is used to specify the port(s) where packets from the CPU should be sent, and to indicate which port received the packet that was forwarded to the CPU.

6.4.10.1 Packets from the Host CPU

The [Switch Engine Ingress Port Type Register \(SWE_INGRSS_PORT_TYP\)](#) configures the switch to use the special VLAN tag in packets from the host CPU as a destination port indicator. A setting of 11b should be used on the port that is connected to the host CPU (typically Port 0). A setting of 00b should be used on the normal network ports.

The special VLAN tag is a normal VLAN tag where the VID field is used as the destination port indicator. If VID bit 3 is zero, then bits 0 and 1 specify the destination port (0, 1, 2) or broadcast (3). If VID bit 3 is one, then the normal ALR lookup is performed and learning is performed on the source address. The PRI field from the VLAN tag is used as the packet priority.

Upon egress from the destination port(s), the special tag is removed. If a regular VLAN tag needs to be sent as part of the packet, then it should be part of the packet data from the host CPU port or set as an unused bit in the VID field.

Note: When specifying Port 0 as the destination port, the VID will be set to 0. A VID of 0 is normally considered a priority tagged packet. Such a packet will be filtered if Admit Only VLAN is set on the host CPU port. Either avoid setting Admit Only VLAN on the host CPU port or set an unused bit in the VID field.

Note: The maximum size tagged packet that can normally be sent into a switch port (from the MII port) is 1522 bytes. Since the special tag consumes four bytes of the packet length, the outgoing packet is limited to 1518 bytes, even if it contains a regular VLAN tag as part of the packet data. If a larger outgoing packet is required, the Jumbo2K bit in the [Port x MAC Receive Configuration Register \(MAC_RX_CFG_x\)](#) of Port 0 should be set.

6.4.10.2 Packets to the Host CPU

The [Buffer Manager Egress Port Type Register \(BM_EGRSS_PORT_TYPE\)](#) configures the switch to add the special VLAN tag in packets to the host CPU as a source port indicator. A setting of 11b should be used only on the port that is connected to the host CPU (typically Port 0). Other settings can be used on the normal network ports as needed.

The special VLAN tag is a normal VLAN tag where bits 0 and 1 of the VID field specify the source port (0, 1, or 2).

Upon egress from the host CPU port, the special tag is added. If a regular VLAN tag already exists, it is not deleted. Instead it will follow the special tag.

6.4.11 Counters

A counter is maintained per port that contains the number of MAC address that were not learned or were overwritten by a different address due to MAC Address Table space limitations. These counters are accessible via the following registers:

- [Switch Engine Port 0 Learn Discard Count Register \(SWE_LRN_DISCRD_CNT_MII\)](#)
- [Switch Engine Port 1 Learn Discard Count Register \(SWE_LRN_DISCRD_CNT_1\)](#)
- [Switch Engine Port 2 Learn Discard Count Register \(SWE_LRN_DISCRD_CNT_2\)](#)

A counter is maintained per port that contains the number of packets filtered at ingress. This count includes packets filtered due to broadcast throttling, but does not include packets dropped due to ingress rate limiting. These counters are accessible via the following registers:

- [Switch Engine Port 0 Ingress Filtered Count Register \(SWE_FILTERED_CNT_MII\)](#)
- [Switch Engine Port 1 Ingress Filtered Count Register \(SWE_FILTERED_CNT_1\)](#)
- [Switch Engine Port 2 Ingress Filtered Count Register \(SWE_FILTERED_CNT_2\)](#)

6.5 Buffer Manager (BM)

The buffer manager (BM) provides control of the free buffer space, the multiple priority transmit queues, transmission scheduling, and packet dropping. VLAN tag insertion and removal is also performed by the buffer manager. The following sections detail the various features of the buffer manager.

6.5.1 Packet Buffer Allocation

The packet buffer consists of 32KB of RAM that is dynamically allocated in 128 byte blocks as packets are received. Up to 16 blocks may be used per packet, depending on the packet length. The blocks are linked together as the packet is received. If a packet is filtered, dropped, or contains a receive error, the buffers are reclaimed.

Datasheet**6.5.1.1 Buffer Limits and Flow Control Levels**

The BM keeps track of the amount of buffers used per each ingress port. These counts are used to generate flow control (half-duplex backpressure or full-duplex pause frames) and to limit the amount of buffer space that can be used by any individual receiver (hard drop limit). The flow control and drop limit thresholds are dynamic and adapt based on the current buffer usage. Based on the number of active receiving ports, the drop level and flow control pause and resume thresholds adjust between fixed settings and two user programmable levels via the [Buffer Manager Drop Level Register \(BM_DROP_LVL\)](#), [Buffer Manager Flow Control Pause Level Register \(BM_FC_PAUSE_LVL\)](#), and [Buffer Manager Flow Control Resume Level Register \(BM_FC_RESUME_LVL\)](#) respectively.

The BM also keeps a count of the number of buffers that are queued for multiple ports (broadcast queue). This count is compared against the [Buffer Manager Broadcast Buffer Level Register \(BM_BCST_LVL\)](#), and if the configured drop level is reached or exceeded, subsequent packets are dropped.

6.5.2 Random Early Discard (RED)

Based on the ingress flow monitoring detailed in [Section 6.4.6, "Ingress Flow Metering and Coloring," on page 73](#), packets are colored as Green, Yellow, or Red. Packets colored Red are always discarded if the Drop on Red bit in the [Buffer Manager Configuration Register \(BM_CFG\)](#) is set. If the Drop on Yellow bit in the [Buffer Manager Configuration Register \(BM_CFG\)](#) is set, packets colored Yellow are randomly discarded based on the moving average number of buffers used by the ingress port.

The probability of a discard is programmable into the Random Discard Weight table via the [Buffer Manager Random Discard Table Command Register \(BM_RNDM_DSCRD_TBL_CMD\)](#), [Buffer Manager Random Discard Table Write Data Register \(BM_RNDM_DSCRD_TBL_WDATA\)](#), and [Buffer Manager Random Discard Table Read Data Register \(BM_RNDM_DSCRD_TBL_RDATA\)](#). The Random Discard Weight table contains sixteen entries, each 10-bits wide. Each entry corresponds to a range of the average number of buffers used by the ingress port. Entry 0 is for 0 to 15 buffers, entry 1 is for 16 to 31 buffers, etc. The probability for each entry is set in 1/1024's. For example, a setting of 1 is 1-in-1024, or approximately 0.1%. A setting of all ones (1023) is 1023-in-1024, or approximately 99.9%.

Refer to [Section 13.3.4.10, "Buffer Manager Random Discard Table Command Register \(BM_RNDM_DSCRD_TBL_CMD\)," on page 366](#) for additional details on writing and reading the Random Discard Weight table.

6.5.3 Transmit Queues

Once a packet has been completely received, it is queued for transmit. There are four queues per transmit port, one for each level of transmit priority. Each queue is virtual (if there are no packets for that port/priority, the queue is empty), and dynamic (a queue may be any length if there is enough memory space). When a packet is read from the memory and sent out to the corresponding port, the used buffers are released.

6.5.4 Transmit Priority Queue Servicing

When a transmit queue is non-empty, it is serviced and the packet is read from the buffer RAM and sent to the transmit MAC. If there are multiple queues that require servicing, one of two methods may be used: fixed priority ordering, or weighted round-robin ordering. If the Fixed Priority Queue Servicing bit in the [Buffer Manager Configuration Register \(BM_CFG\)](#) is set, a strict order, fixed priority is selected. Transmit queue 3 has the highest priority, followed by 2, 1, and 0. If the Fixed Priority Queue Servicing bit in the [Buffer Manager Configuration Register \(BM_CFG\)](#) is cleared, a weighted round-robin order is followed. Assuming all four queues are non-empty, the service is weighted with a 9:4:2:1 ratio (queue 3,2,1,0). The servicing is blended to avoid burstiness (e.g. queue 3, then queue 2, then queue 3, etc.).

6.5.5 Egress Rate Limiting (Leaky Bucket)

For egress rate limiting, the leaky bucket algorithm is used on each output priority queue. For each output port, the bandwidth that is used by each priority queue can be limited. If any egress queue receives packets faster than the specified egress rate, packets will be accumulated in the packet memory. After the memory is used, packet dropping or flow control will be triggered.

Note: Egress rate limiting occurs before the [Transmit Priority Queue Servicing](#), such that a lower priority queue will be serviced if a higher priority queue is being rate limited.

The egress limiting is enabled per priority queue. After a packet is selected to be sent, its length is recorded. The switch then waits a programmable amount of time, scaled by the packet length, before servicing that queue once again. The amount of time per byte is programmed into the Buffer Manager Egress Rate registers (refer to [Section 13.3.4.14](#) through [Section 13.3.4.19](#) for detailed register definitions). The value programmed is in approximately 20 nS per byte increments. Typical values are listed in [Table 6.5](#). When a port is transmitting at 10 Mbps, any setting above 39 has the effect of not limiting the rate.

Table 6.5 Typical Egress Rate Settings

EGRESS RATE SETTING	TIME PER BYTE	BANDWIDTH @ 64 BYTE PACKET	BANDWIDTH @ 512 BYTE PACKET	BANDWIDTH @ 1518 BYTE PACKET
0-3	80 nS	76 Mbps (Note 6.3)	96 Mbps (Note 6.3)	99 Mbps (Note 6.3)
4	100 nS	66 Mbps	78 Mbps	80 Mbps
5	120 nS	55 Mbps	65 Mbps	67 Mbps
6	140 nS	48 Mbps	56 Mbps	57 Mbps
7	160 nS	42 Mbps	49 Mbps	50 Mbps
9	200 nS	34 Mbps	39 Mbps	40 Mbps
12	260 nS	26 Mbps	30 Mbps	31 Mbps
19	400 nS	17 Mbps	20 Mbps	20 Mbps
39	800 nS	8.6 Mbps	10 Mbps	10 Mbps
78	1580 nS	4.4 Mbps	5 Mbps	5 Mbps
158	3180 nS	2.2 Mbps	2.5 Mbps	2.5 Mbps
396	7940 nS	870 Kbps	990 Kbps	1 Mbps
794	15900 nS	440 Kbps	490 Kbps	500 Kbps
1589	31800 nS	220 Kbps	250 Kbps	250 Kbps
3973	79480 nS	87 Kbps	98 Kbps	100 Kbps
7947	158960 nS	44 Kbps	49 Kbps	50 Kbps

Note 6.3 These are the unlimited max bandwidths when IFG and preamble are taken into account.

6.5.6 Adding, Removing, and Changing VLAN Tags

Based on the port configuration and the received packet formation, a VLAN tag can be added to, removed from, or modified in a packet. There are four received packet type cases: non-tagged, priority-tagged, normal-tagged, and CPU special-tagged. There are also four possible settings for an egress port: dumb, access, hybrid, and CPU. In addition, each VLAN table entry can specify the removal of the VLAN tag (the entry's un-tag bit).

Datasheet

The tagging/un-tagging rules are specified as follows:

- **Dumb Port** - This port type generally does not change the tag.
When a received packet is non-tagged, priority-tagged, or normal-tagged, the packet passes untouched.
When a packet is received special-tagged from a CPU port, the special tag is removed.
- **Access Port** - This port type generally does not support tagging.
When a received packet in non-tagged, the packet passes untouched.
When a received packet is priority-tagged or normal-tagged, the tag is removed.
When a received packet is special-tagged from a CPU port, the special tag is removed.
- **CPU Port** - Packets transmitted from this port type generally contain a special tag. Special tags are described in detail in [Section 6.4.10, "Host CPU Port Special Tagging," on page 77](#).
- **Hybrid Port** - Generally, this port type supports a mix of normal-tagged and non-tagged packets. It is the most complex, but most flexible port type.

For clarity, the following details the incoming un-tag instruction. As described in [Section 6.4.4, "VLAN Support," on page 72](#), the un-tag instruction is one of three un-tag bits from the applicable entry in the VLAN table, selected by the ingress port number. The entry in the VLAN table is either the VLAN from the received packet or the ingress ports default VID.

- When a received packet is non-tagged, a new VLAN tag is added if two conditions are met. First, the Insert Tag bit for the egress port in the [Buffer Manager Egress Port Type Register \(BM_EGRSS_PORT_TYPE\)](#) must be set. Second, the un-tag instruction associated with the ingress ports default VID must be cleared. The VLAN tag that is added will have a VID and Priority taken from the *ingress* ports default VID and priority.
- When a received packet is priority-tagged, either the tag is removed or it is modified.
If the un-tag instruction associated with the ingress ports default VID is set, then the tag is removed. Otherwise, the tag is modified. The VID of the new VLAN tag is changed to the *ingress* ports default VID. If the Change Priority bit in the [Buffer Manager Egress Port Type Register \(BM_EGRSS_PORT_TYPE\)](#) for the egress port is set, then the Priority field of the new VLAN tag is also changed to the *ingress* ports default priority.
- When a received packet is normal-tagged, either the tag is removed, modified, or passed.
If the un-tag instruction associated with the VID in the received packet is set, then the tag is removed.
Else, if the Change Tag bit in the [Buffer Manager Egress Port Type Register \(BM_EGRSS_PORT_TYPE\)](#) for the egress port is clear, the packet is untouched.
Else, if both the Change VLAN ID and the Change Priority bits in the [Buffer Manager Egress Port Type Register \(BM_EGRSS_PORT_TYPE\)](#) for the egress port are clear, the packet passes untouched.
Otherwise, the tag is modified. If the Change VLAN ID bit for the egress port is set, the VOD of the new VLAN tag is changed to the *egress* ports default ID. If the Change Priority bit for the egress port is set, the Priority field of the new VLAN is changed to the *egress* ports default priority.
- When a packet is received special-tagged from a CPU port, the special tag is removed.

Hybrid tagging is summarized in Figure 6.9.

Figure 6.9 Hybrid Port Tagging and Un-tagging

The default VLAN ID and priority of each port may be configured via the following registers:

- Buffer Manager Port 0 Default VLAN ID and Priority Register (BM_VLAN_MII)
- Buffer Manager Port 1 Default VLAN ID and Priority Register (BM_VLAN_1)
- Buffer Manager Port 2 Default VLAN ID and Priority Register (BM_VLAN_2)

6.5.7 Counters

A counter is maintained per port that contains the number of packets dropped due to buffer space limits and ingress rate limit discarding (Red and random Yellow dropping). These counters are accessible via the following registers:

- Buffer Manager Port 0 Drop Count Register (BM_DRP_CNT_SRC_MII)
- Buffer Manager Port 1 Drop Count Register (BM_DRP_CNT_SRC_1)
- Buffer Manager Port 2 Drop Count Register (BM_DRP_CNT_SRC_2)

A counter is maintained per port that contains the number of packets dropped due solely to ingress rate limit discarding (Red and random Yellow dropping). This count value can be subtracted from the drop counter, as described above, to obtain the drop counts due solely to buffer space limits. The ingress rate drop counters are accessible via the following registers:

- Buffer Manager Port 0 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_MII)
- Buffer Manager Port 1 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_1)
- Buffer Manager Port 2 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_2)

6.6 Switch Fabric Interrupts

The switch fabric is capable of generating multiple maskable interrupts from the buffer manager, switch engine, and MACs. These interrupts are detailed in [Section 5.2.2, "Switch Fabric Interrupts,"](#) on [page 54](#).

Chapter 7 Ethernet PHYs

7.1 Functional Overview

The LAN9313/LAN9313i contains three PHYs: Port 1 PHY, Port 2 PHY and a Virtual PHY. The Port 1 & 2 PHYs are identical in functionality and each connect their corresponding Ethernet signal pins to the switch fabric MAC of their respective port. These PHYs interface with their respective MAC via an internal MII interface. The Virtual PHY provides the virtual functionality of a PHY and allows connection of an external MAC to port 0 of the switch fabric as if it was connected to a single port PHY. All PHYs comply with the IEEE 802.3 Physical Layer for Twisted Pair Ethernet and can be configured for full/half duplex 100 Mbps (100BASE-TX) or 10Mbps (10BASE-T) Ethernet operation. All PHY registers follow the IEEE 802.3 (clause 22.2.4) specified MII management register set and can be configured indirectly via the external MII interface signals, or directly via the memory mapped Virtual PHY registers. In addition, the Port 1 PHY and Port 2 PHY can be configured via the PHY Management Interface (PMI). Refer to [Section 13.2, "Ethernet PHY Control and Status Registers"](#) for details on the Ethernet PHY registers.

The LAN9313/LAN9313i Ethernet PHYs are discussed in detail in the following sections:

- [Section 7.2, "Port 1 & 2 PHYs," on page 85](#)
- [Section 7.3, "Virtual PHY," on page 98](#)

7.1.1 PHY Addressing

Each individual PHY is assigned a unique default PHY address via the `phy_addr_sel_strap` configuration strap as shown in [Table 7.1](#). In addition, the Port 1 PHY and Port 2 PHY addresses can be changed via the [PHY Address \(PHYADD\)](#) field in the [Port x PHY Special Modes Register \(PHY_SPECIAL_MODES_x\)](#). For proper operation, all LAN9313/LAN9313i PHY addresses must be unique. No check is performed to assure each PHY is set to a different address. Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps," on page 45](#).

Table 7.1 Default PHY Serial MII Addressing

PHY_ADDR_SEL_STRAP	VIRTUAL PHY DEFAULT ADDRESS VALUE	PORT 1 PHY DEFAULT ADDRESS VALUE	PORT 2 PHY DEFAULT ADDRESS VALUE
0	0	1	2
1	1	2	3

Datasheet

7.2 Port 1 & 2 PHYs

Functionally, each PHY can be divided into the following sections:

- 100BASE-TX Transmit and 100BASE-TX Receive
- 10BASE-T Transmit and 10BASE-T Receive
- PHY Auto-negotiation
- HP Auto-MDIX
- MII MAC Interface
- PHY Management Control

Note 7.1 Because the Port 1 PHY and Port 2 PHY are functionally identical, this section will describe them as the “Port x PHY”, or simply “PHY”. Wherever a lowercase “x” has been appended to a port or signal name, it can be replaced with “1” or “2” to indicate the Port 1 or Port 2 PHY respectively. All references to “PHY” in this section can be used interchangeably for both the Port 1 & 2 PHYs. This nomenclature excludes the Virtual PHY.

A block diagram of the Port x PHYs main components can be seen in [Figure 7.1](#).

Figure 7.1 Port x PHY Block Diagram

7.2.1 100BASE-TX Transmit

The 100BASE-TX transmit data path is shown in [Figure 7.2](#). Shaded blocks are those which are internal to the PHY. Each major block is explained in the following sections.

Figure 7.2 100BASE-TX Transmit Data Path

7.2.1.1 MII MAC Interface

For a transmission, the switch fabric MAC drives the transmit data to the PHYs MII MAC Interface. The MII MAC Interface is described in detail in [Section 7.2.7, "MII MAC Interface"](#).

Note: The PHY is connected to the switch fabric MAC via standard MII signals. Refer to the IEEE 802.3 specification for additional details.

7.2.1.2 4B/5B Encoder

The transmit data passes from the MII block to the 4B/5B Encoder. This block encodes the data from 4-bit nibbles to 5-bit symbols (known as "code-groups") according to [Table 7.2](#). Each 4-bit data-nibble is mapped to 16 of the 32 possible code-groups. The remaining 16 code-groups are either used for control information or are not valid.

The first 16 code-groups are referred to by the hexadecimal values of their corresponding data nibbles, 0 through F. The remaining code-groups are given letter designations with slashes on either side. For example, an IDLE code-group is /I/, a transmit error code-group is /H/, etc.

Table 7.2 4B/5B Code Table

CODE GROUP	SYM	RECEIVER INTERPRETATION			TRANSMITTER INTERPRETATION		
11110	0	0	0000	DATA	0	0000	DATA
01001	1	1	0001		1	0001	
10100	2	2	0010		2	0010	
10101	3	3	0011		3	0011	
01010	4	4	0100		4	0100	
01011	5	5	0101		5	0101	
01110	6	6	0110		6	0110	
01111	7	7	0111		7	0111	
10010	8	8	1000		8	1000	
10011	9	9	1001		9	1001	
10110	A	A	1010		A	1010	
10111	B	B	1011		B	1011	
11010	C	C	1100		C	1100	
11011	D	D	1101		D	1101	
11100	E	E	1110		E	1110	
11101	F	F	1111		F	1111	
11111	/I/	IDLE			Sent after /T/R/ until the MII Transmitter Enable signal (TXEN) is received		
11000	/J/	First nibble of SSD, translated to "0101" following IDLE, else MII Receive Error (RXER)			Sent for rising MII Transmitter Enable signal (TXEN)		
10001	/K/	Second nibble of SSD, translated to "0101" following J, else MII Receive Error (RXER)			Sent for rising MII Transmitter Enable signal (TXEN)		
01101	/T/	First nibble of ESD, causes de-assertion of CRS if followed by /R/, else assertion of MII Receive Error (RXER)			Sent for falling MII Transmitter Enable signal (TXEN)		
00111	/R/	Second nibble of ESD, causes de-assertion of CRS if following /T/, else assertion of MII Receive Error (RXER)			Sent for falling MII Transmitter Enable signal (TXEN)		
00100	/H/	Transmit Error Symbol			Sent for rising MII Transmit Error (TXER)		
00110	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)			INVALID		
11001	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)			INVALID		
00000	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)			INVALID		
00001	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)			INVALID		

Table 7.2 4B/5B Code Table (continued)

CODE GROUP	SYM	RECEIVER INTERPRETATION	TRANSMITTER INTERPRETATION
00010	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)	INVALID
00011	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)	INVALID
00101	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)	INVALID
01000	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)	INVALID
01100	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)	INVALID
10000	/V/	INVALID, MII Receive Error (RXER) if during MII Receive Data Valid (RXDV)	INVALID

7.2.1.3 Scrambler and PISO

Repeated data patterns (especially the IDLE code-group) can have power spectral densities with large narrow-band peaks. Scrambling the data helps eliminate these peaks and spread the signal power more uniformly over the entire channel bandwidth. This uniform spectral density is required by FCC regulations to prevent excessive EMI from being radiated by the physical wiring. The scrambler also performs the Parallel In Serial Out conversion (PISO) of the data.

The seed for the scrambler is generated from the PHY address, ensuring that each PHY will have its own scrambler sequence. For more information on PHY addressing, refer to [Section 7.1.1, "PHY Addressing"](#).

7.2.1.4 NRZI and MLT-3 Encoding

The scrambler block passes the 5-bit wide parallel data to the NRZI converter where it becomes a serial 125MHz NRZI data stream. The NRZI is then encoded to MLT-3. MLT-3 is a tri-level code where a change in the logic level represents a code bit "1" and the logic output remaining at the same level represents a code bit "0".

7.2.1.5 100M Transmit Driver

The MLT-3 data is then passed to the analog transmitter, which drives the differential MLT-3 signal on output pins TXPx and TXNx (where "x" is replaced with "1" for the Port 1 PHY, or "2" for the Port 2 PHY), to the twisted pair media across a 1:1 ratio isolation transformer. The 10BASE-T and 100BASE-TX signals pass through the same transformer so that common "magnetics" can be used for both. The transmitter drives into the 100Ω impedance of the CAT-5 cable. Cable termination and impedance matching require external components.

7.2.1.6 100M Phase Lock Loop (PLL)

The 100M PLL locks onto the reference clock and generates the 125MHz clock used to drive the 125 MHz logic and the 100BASE-TX Transmitter.

Datasheet

7.2.2 100BASE-TX Receive

The 100BASE-TX receive data path is shown in Figure 7.3. Shaded blocks are those which are internal to the PHY. Each major block is explained in the following sections.

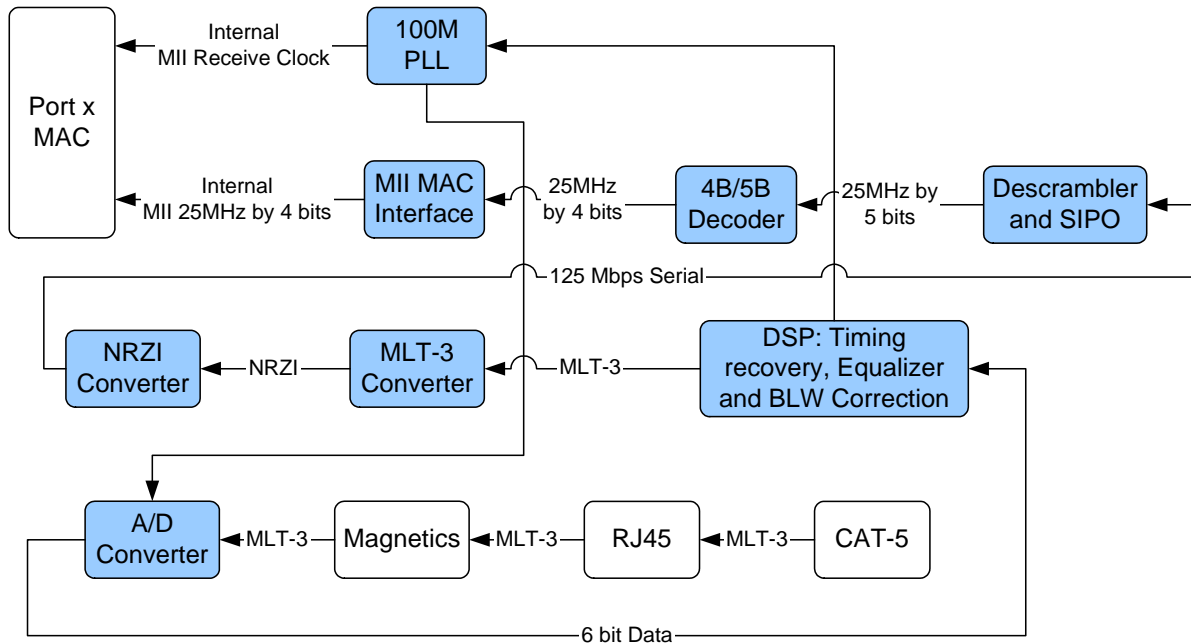

Figure 7.3 100BASE-TX Receive Data Path

7.2.2.1 A/D Converter

The MLT-3 data from the cable is fed into the PHY on inputs RXP_x and RXN_x (where “x” is replaced with “1” for the Port 1 PHY, or “2” for the Port 2 PHY) via a 1:1 ratio transformer. The ADC samples the incoming differential signal at a rate of 125M samples per second. Using a 64-level quantizer, 6 digital bits are generated to represent each sample. The DSP adjusts the gain of the A/D Converter (ADC) according to the observed signal levels such that the full dynamic range of the ADC can be used.

7.2.2.2 DSP: Equalizer, BLW Correction and Clock/Data Recovery

The 6 bits from the ADC are fed into the DSP block. The equalizer in the DSP section compensates for phase and amplitude distortion caused by the physical channel (magnetics, connectors, and CAT-5 cable). The equalizer can restore the signal for any good-quality CAT-5 cable between 1m and 150m.

If the DC content of the signal is such that the low-frequency components fall below the low frequency pole of the isolation transformer, then the droop characteristics of the transformer will become significant and Baseline Wander (BLW) on the received signal will result. To prevent corruption of the received data, the PHY corrects for BLW and can receive the ANSI X3.263-1995 FDDI TP-PMD defined “killer packet” with no bit errors.

The 100M PLL generates multiple phases of the 125MHz clock. A multiplexer, controlled by the timing unit of the DSP, selects the optimum phase for sampling the data. This is used as the received recovered clock. This clock is used to extract the serial data from the received signal.

7.2.2.3 NRZI and MLT-3 Decoding

The DSP generates the MLT-3 recovered levels that are fed to the MLT-3 converter. The MLT-3 is then converted to an NRZI data stream.

7.2.2.4 Descrambler and SIPO

The descrambler performs an inverse function to the scrambler in the transmitter and also performs the Serial In Parallel Out (SIPO) conversion of the data.

During reception of IDLE (/I/) symbols, the descrambler synchronizes its descrambler key to the incoming stream. Once synchronization is achieved, the descrambler locks on this key and is able to descramble incoming data.

Special logic in the descrambler ensures synchronization with the remote PHY by searching for IDLE symbols within a window of 4000 bytes (40us). This window ensures that a maximum packet size of 1514 bytes, allowed by the IEEE 802.3 standard, can be received with no interference. If no IDLE-symbols are detected within this time-period, receive operation is aborted and the descrambler re-starts the synchronization process.

The de-scrambled signal is then aligned into 5-bit code-groups by recognizing the /J/K/ Start-of-Stream Delimiter (SSD) pair at the start of a packet. Once the code-word alignment is determined, it is stored and utilized until the next start of frame.

7.2.2.5 5B/4B Decoding

The 5-bit code-groups are translated into 4-bit data nibbles according to the 4B/5B table shown in [Table 7.2](#). The translated data is presented on the internal MII RXD[3:0] signal lines to the switch fabric MAC. The SSD, /J/K/, is translated to "0101 0101" as the first 2 nibbles of the MAC preamble. Reception of the SSD causes the PHY to assert the RXDV signal, indicating that valid data is available on the RXD bus. Successive valid code-groups are translated to data nibbles. Reception of either the End of Stream Delimiter (ESD) consisting of the /T/R/ symbols, or at least two /I/ symbols causes the PHY to de-assert carrier sense and RXDV. These symbols are not translated into data.

7.2.2.6 Receiver Errors

During a frame, unexpected code-groups are considered receive errors. Expected code groups are the DATA set (0 through F), and the /T/R/ (ESD) symbol pair. When a receive error occurs, the internal MII's RXER signal is asserted and arbitrary data is driven onto the internal receive data bus (RXD) to the switch fabric MAC. Should an error be detected during the time that the /J/K/ delimiter is being decoded (bad SSD error), RXER is asserted and the value 1110b is driven onto the internal receive data bus (RXD) to the switch fabric MAC. Note that the internal MII's data valid signal (RXDV) is not yet asserted when the bad SSD occurs.

7.2.2.7 MII MAC Interface

For reception, the 4-bit data nibbles are sent to the MII MAC Interface block where they are sent via MII to the switch fabric MAC. The MII MAC Interface is described in detail in [Section 7.2.7, "MII MAC Interface"](#).

Note: The PHY is connected to the switch fabric MAC via standard MII signals. Refer to the IEEE 802.3 specification for additional details.

Datasheet

7.2.3 10BASE-T Transmit

Data to be transmitted comes from the switch fabric MAC. The 10BASE-T transmitter receives 4-bit nibbles from the internal MII at a rate of 2.5MHz and converts them to a 10Mbps serial data stream. The data stream is then Manchester-encoded and sent to the analog transmitter, which drives a signal onto the twisted pair via the external magnetics.

10BASE-T transmissions use the following blocks:

- MII MAC Interface (digital)
- 10M TX Driver (digital/analog)
- 10M PLL (analog)

7.2.3.1 MII MAC Interface

For a transmission, the switch fabric MAC drives the transmit data to the PHYs MII MAC Interface. The MII MAC Interface is described in detail in [Section 7.2.7, "MII MAC Interface"](#).

Note: The PHY is connected to the switch fabric MAC via standard MII signals. Refer to the IEEE 802.3 specification for additional details.

7.2.3.2 10M TX Driver and PLL

The 4-bit wide data is sent to the 10M TX Driver block. The nibbles are converted to a 10Mbps serial NRZI data stream. The 10M PLL locks onto the external clock or internal oscillator and produces a 20MHz clock. This is used to Manchester encode the NRZ data stream. When no data is being transmitted (TXEN is low), the 10M TX Driver block outputs Normal Link Pulses (NLPs) to maintain communications with the remote link partner. The manchester encoded data is sent to the analog transmitter where it is shaped and filtered before being driven out as a differential signal across the TXPx and TXNx outputs (where "x" is replaced with "1" for the Port 1 PHY, or "2" for the Port 2 PHY).

7.2.4 10BASE-T Receive

The 10BASE-T receiver gets the Manchester-encoded analog signal from the cable via the magnetics. It recovers the receive clock from the signal and uses this clock to recover the NRZI data stream. This 10M serial data is converted to 4-bit data nibbles which are passed to the controller across the internal MII at a rate of 2.5MHz.

10BASE-T reception uses the following blocks:

- Filter and SQUELCH (analog)
- 10M RX (digital/analog)
- MII MAC Interface (digital)
- 10M PLL (analog)

7.2.4.1 Filter and Squelch

The Manchester signal from the cable is fed into the PHY on inputs RXPx and RXNx (where "x" is replaced with "1" for Port 1, or "2" for Port 2) via 1:1 ratio magnetics. It is first filtered to reduce any out-of-band noise. It then passes through a SQUELCH circuit. The SQUELCH is a set of amplitude and timing comparators that normally reject differential voltage levels below 300mV and detect and recognize differential voltages above 585mV.

7.2.4.2 10M RX and PLL

The output of the SQUELCH goes to the 10M RX block where it is validated as Manchester encoded data. The polarity of the signal is also checked. If the polarity is reversed (local RXP is connected to RXN of the remote partner and vice versa), then this is identified and corrected. The reversed condition is indicated by the flag "XPOL", bit 4 in [Port x PHY Special Control/Status Indication Register](#)

([PHY_SPECIAL_CONTROL_STAT_IND_x](#)). The 10M PLL locks onto the received Manchester signal and generates the received 20MHz clock from it. Using this clock, the Manchester encoded data is extracted and converted to a 10MHz NRZI data stream. It is then converted from serial to 4-bit wide parallel data.

The RX10M block also detects valid 10BASE-T IDLE signals - Normal Link Pulses (NLPs) - to maintain the link.

7.2.4.3 MII MAC Interface

For reception, the 4-bit data nibbles are sent to the MII MAC Interface block where they are sent via MII to the switch fabric MAC. The MII MAC Interface is described in detail in [Section 7.2.7, "MII MAC Interface"](#).

Note: The PHY is connected to the switch fabric MAC via standard MII signals. Refer to the IEEE 802.3 specification for additional details.

7.2.4.4 Jabber Detection

Jabber is a condition in which a station transmits for a period of time longer than the maximum permissible packet length, usually due to a fault condition, that results in holding the TXEN input for an extended period of time. Special logic is used to detect the jabber state and abort the transmission to the line, within 45ms. Once TXEN is deasserted, the logic resets the jabber condition.

7.2.5 PHY Auto-negotiation

The purpose of the auto-negotiation function is to automatically configure the PHY to the optimum link parameters based on the capabilities of its link partner. Auto-negotiation is a mechanism for exchanging configuration information between two link-partners and automatically selecting the highest performance mode of operation supported by both sides. Auto-negotiation is fully defined in clause 28 of the IEEE 802.3 specification and is enabled by setting bit 12 (PHY_AN) of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#).

The advertised capabilities of the PHY are stored in the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#). The PHY contains the ability to advertise 100BASE-TX and 10BASE-T in both full or half-duplex modes. Besides the connection speed, the PHY can advertise remote fault indication and symmetric or asymmetric pause flow control as defined in the IEEE 802.3 specification. The LAN9313/LAN9313i does not support "Next Page" capability. Many of the default advertised capabilities of the PHY are determined via configuration straps as shown in [Section 13.2.2.5, "Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)," on page 239](#). Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for additional details on how to use the LAN9313/LAN9313i configuration straps.

Once auto-negotiation has completed, information about the resolved link and the results of the negotiation process are reflected in the speed indication bits in the [Port x PHY Special Control/Status Register \(PHY_SPECIAL_CONTROL_STATUS_x\)](#), as well as the [Port x PHY Auto-Negotiation Link Partner Base Page Ability Register \(PHY_AN_LP_BASE_ABILITY_x\)](#).

The auto-negotiation protocol is a purely physical layer activity and proceeds independently of the MAC controller.

The following blocks are activated during an Auto-negotiation session:

- Auto-negotiation (digital)
- 100M ADC (analog)
- 100M PLL (analog)
- 100M equalizer/BLW/clock recovery (DSP)
- 10M SQUELCH (analog)

Datasheet

- 10M PLL (analog)
- 10M TX Driver (analog)

Auto-negotiation is started by the occurrence of any of the following events:

- Power-On Reset (POR)
- Hardware reset (nRST)
- PHY Software reset (via [Reset Control Register \(RESET_CTL\)](#), or bit 15 of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#))
- PHY Power-down reset ([Section 7.2.9, "PHY Power-Down Modes," on page 96](#))
- PHY Link status down (bit 2 of the [Port x PHY Basic Status Register \(PHY_BASIC_STATUS_x\)](#) is cleared)
- Setting the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#), bit 9 high (auto-neg restart)
- Digital Reset (via bit 0 of the [Reset Control Register \(RESET_CTL\)](#))
- Issuing an EEPROM Loader RELOAD command ([Section 8.2.4, "EEPROM Loader," on page 113](#))

Note: Refer to [Section 4.2, "Resets," on page 41](#) for information on these and other system resets.

On detection of one of these events, the PHY begins auto-negotiation by transmitting bursts of Fast Link Pulses (FLP). These are bursts of link pulses from the 10M TX Driver. They are shaped as Normal Link Pulses and can pass uncorrupted down CAT-3 or CAT-5 cable. A Fast Link Pulse burst consists of up to 33 pulses. The 17 odd-numbered pulses, which are always present, frame the FLP burst. The 16 even-numbered pulses, which may be present or absent, contain the data word being transmitted. Presence of a data pulse represents a "1", while absence represents a "0".

The data transmitted by an FLP burst is known as a "Link Code Word." These are defined fully in IEEE 802.3 clause 28. In summary, the PHY advertises 802.3 compliance in its selector field (the first 5 bits of the Link Code Word). It advertises its technology ability according to the bits set in the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#).

There are 4 possible matches of the technology abilities. In the order of priority these are:

- 100M Full Duplex (highest priority)
- 100M Half Duplex
- 10M Full Duplex
- 10M Half Duplex (lowest priority)

If the full capabilities of the PHY are advertised (100M, full-duplex), and if the link partner is capable of 10M and 100M, then auto-negotiation selects 100M as the highest performance mode. If the link partner is capable of half and full-duplex modes, then auto-negotiation selects full-duplex as the highest performance mode.

Once a speed and duplex match has been determined, the link code words are repeated with the acknowledge bit set. Any difference in the main content of the link code words at this time will cause auto-negotiation to re-start. Auto-negotiation will also re-start if all of the required FLP bursts are not received.

Writing the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) bits [8:5] allows software control of the capabilities advertised by the PHY. Writing the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) does not automatically re-start auto-negotiation. The [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#), bit 9 must be set before the new abilities will be advertised. Auto-negotiation can also be disabled via software by clearing bit 12 of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#).

7.2.5.1 PHY Pause Flow Control

The Port 1 & 2 PHYs are capable of generating and receiving pause flow control frames per the IEEE 802.3 specification. The PHYs advertised pause flow control abilities are set via bits 10 (Symmetric Pause) and 11 (Asymmetric Pause) of the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#). This allows the PHY to advertise its flow control abilities and auto-negotiate the flow control settings with its link partner. The default values of these bits are determined via configuration straps as defined in [Section 13.2.2.5, "Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)," on page 239](#).

The pause flow control settings may also be manually set via the manual flow control registers [Port 1 Manual Flow Control Register \(MANUAL_FC_1\)](#) and [Port 2 Manual Flow Control Register \(MANUAL_FC_2\)](#). These registers allow the switch fabric ports flow control settings to be manually set when auto-negotiation is disabled or the Manual Flow Control Select bit 0 is set. The currently enabled duplex and flow control settings can also be monitored via these registers. The flow control values in the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) are not affected by the values of the manual flow control register. Refer to [Section 6.2.3, "Flow Control Enable Logic," on page 60](#) for additional information.

7.2.5.2 Parallel Detection

If the LAN9313/LAN9313i is connected to a device lacking the ability to auto-negotiate (i.e. no FLPs are detected), it is able to determine the speed of the link based on either 100M MLT-3 symbols or 10M Normal Link Pulses. In this case the link is presumed to be half-duplex per the IEEE 802.3 standard. This ability is known as "Parallel Detection." This feature ensures interoperability with legacy link partners. If a link is formed via parallel detection, then bit 0 in the [Port x PHY Auto-Negotiation Expansion Register \(PHY_AN_EXP_x\)](#) is cleared to indicate that the link partner is not capable of auto-negotiation. If a fault occurs during parallel detection, bit 4 of the [Port x PHY Auto-Negotiation Expansion Register \(PHY_AN_EXP_x\)](#) is set.

The [Port x PHY Auto-Negotiation Link Partner Base Page Ability Register \(PHY_AN_LP_BASE_ABILITY_x\)](#) is used to store the Link Partner Ability information, which is coded in the received FLPs. If the link partner is not auto-negotiation capable, then this register is updated after completion of parallel detection to reflect the speed capability of the link partner.

7.2.5.3 Restarting Auto-Negotiation

Auto-negotiation can be re-started at any time by setting bit 9 of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). Auto-negotiation will also re-start if the link is broken at any time. A broken link is caused by signal loss. This may occur because of a cable break, or because of an interruption in the signal transmitted by the Link Partner. Auto-negotiation resumes in an attempt to determine the new link configuration.

If the management entity re-starts Auto-negotiation by writing to bit 9 of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#), the LAN9313/LAN9313i will respond by stopping all transmission/receiving operations. Once the internal break link time of approximately 1200ms has passed in the Auto-negotiation state-machine, the auto-negotiation will re-start. In this case, the link partner will have also dropped the link due to lack of a received signal, so it too will resume auto-negotiation.

7.2.5.4 Disabling Auto-Negotiation

Auto-negotiation can be disabled by clearing bit 12 of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). The PHY will then force its speed of operation to reflect the speed (bit 13) and duplex (bit 8) of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). The speed and duplex bits in the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) should be ignored when auto-negotiation is enabled.

Datasheet
7.2.5.5 Half Vs. Full-Duplex

Half-duplex operation relies on the CSMA/CD (Carrier Sense Multiple Access / Collision Detect) protocol to handle network traffic and collisions. In this mode, the carrier sense signal, CRS, responds to both transmit and receive activity. If data is received while the PHY is transmitting, a collision results.

In full-duplex mode, the PHY is able to transmit and receive data simultaneously. In this mode, CRS responds only to receive activity. The CSMA/CD protocol does not apply and collision detection is disabled.

7.2.6 HP Auto-MDIX

HP Auto-MDIX facilitates the use of CAT-3 (10 BASE-T) or CAT-5 (100 BASE-T) media UTP interconnect cable without consideration of interface wiring scheme. If a user plugs in either a direct connect LAN cable or a cross-over patch cable, as shown in [Figure 7.4](#) (See [Note 7.1 on page 85](#)), the PHY is capable of configuring the TXPx/TXNx and RXPx/RXNx twisted pair pins for correct transceiver operation.

The internal logic of the device detects the TX and RX pins of the connecting device. Since the RX and TX line pairs are interchangeable, special PCB design considerations are needed to accommodate the symmetrical magnetics and termination of an Auto-MDIX design.

The Auto-MDIX function can be disabled through bit 15 (AMDIXCTRL) of the [Port x PHY Special Control/Status Indication Register \(PHY_SPECIAL_CONTROL_STAT_IND_x\)](#). When AMDIXCTRL is cleared, Auto-MDIX can be selected via the `auto_mdix_strap_x` configuration strap. The MDIX can also be configured manually via the `manual_mdix_strap_x` if both the AMDIXCTRL bit and the `auto_mdix_strap_x` configuration strap are low. Refer to [Section 3.2, "Pin Descriptions," on page 28](#) for more information on the configuration straps.

When bit 15 (AMDIXCTRL) of the [Port x PHY Special Control/Status Indication Register \(PHY_SPECIAL_CONTROL_STAT_IND_x\)](#) is set to 1, the Auto-MDIX capability is determined by bits 13 and 14 of the [Port x PHY Special Control/Status Indication Register \(PHY_SPECIAL_CONTROL_STAT_IND_x\)](#).

Figure 7.4 Direct Cable Connection vs. Cross-Over Cable Connection

7.2.7 MII MAC Interface

The MII MAC Interface is responsible for the transmission and reception of the Ethernet data to and from the switch fabric MAC. The PHY is connected internally to the switch fabric MAC via standard MII signals per IEEE 802.3.

For a transmission, the switch fabric MAC drives the transmit data onto the internal MII TXD bus and asserts TXEN to indicate valid data. The data is in the form of 4-bit wide data at a rate of 25MHz for 100BASE-TX, or 2.5MHz for 10BASE-T.

For reception, the 4-bit data nibbles are sent to the MII MAC Interface block. These data nibbles are clocked to the controller at a rate of 25MHz for 100BASE-TX, or 2.5MHz for 10BASE-T. RXCLK is the output clock for the internal MII bus. It is recovered from the received data to clock the RXD bus. If there is no received signal, it is derived from the system reference clock.

7.2.8 PHY Management Control

The PHY Management Control block is responsible for the management functions of the PHY, including register access and interrupt generation. A Serial Management Interface (SMI) is used to support registers 0 through 6 as required by the IEEE 802.3 (Clause 22), as well as the vendor specific registers allowed by the specification. The SMI interface consists of the MII Management Data (MDIO) signal and the MII Management Clock (MDC) signal. These signals interface to the MDIO and MDC pins of the LAN9313/LAN9313i (or the PMI block in I²C and SPI modes of operation) and allow access to all PHY registers. Refer to [Section 13.2.2, "Port 1 & 2 PHY Registers," on page 231](#) for a list of all supported registers and register descriptions. Non-supported registers will be read as FFFFh.

7.2.8.1 PHY Interrupts

The PHY contains the ability to generate various interrupt events as described in [Table 7.3](#). Reading the [Port x PHY Interrupt Source Flags Register \(PHY_INTERRUPT_SOURCE_x\)](#) shows the source of the interrupt, and clears the interrupt signal. The [Port x PHY Interrupt Mask Register \(PHY_INTERRUPT_MASK_x\)](#) enables or disables each PHY interrupt. The PHY Management Control block aggregates the enabled interrupts status into an internal signal which is sent to the System Interrupt Controller and is reflected via the [Interrupt Status Register \(INT_STS\)](#) bit 26 (PHY_INT1) for the Port 1 PHY, and bit 27 (PHY_INT2) for the Port 2 PHY. For more information on the LAN9313/LAN9313i interrupts, refer to [Chapter 5, "System Interrupts," on page 52](#).

Table 7.3 PHY Interrupt Sources

INTERRUPT SOURCE	PHY_INTERRUPT_MASK_x & PHY_INTERRUPT_SOURCE_x REGISTER BIT #
ENERGYON Activated	7
Auto-Negotiation Complete	6
Remote Fault Detected	5
Link Down (Link Status Negated)	4
Auto-Negotiation LP Acknowledge	3
Parallel Detection Fault	2
Auto-Negotiation Page Received	1

7.2.9 PHY Power-Down Modes

There are two power-down modes for the PHY:

- [PHY General Power-Down](#)
- [PHY Energy Detect Power-Down](#)

Note: For more information on the various power management features of the LAN9313/LAN9313i, refer to [Section 4.3, "Power Management," on page 51](#).

Datasheet

Note: The power-down modes of each PHY (Port 1 PHY and Port 2 PHY) are controlled independently.

Note: The PHY power-down modes do not reload or reset the PHY registers.

7.2.9.1 PHY General Power-Down

This power-down mode is controlled by bit 11 of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). In this mode the entire PHY, except the PHY management control interface, is powered down. The PHY will remain in this power-down state as long as bit 11 is set. When bit 11 is cleared, the PHY powers up and is automatically reset.

7.2.9.2 PHY Energy Detect Power-Down

This power-down mode is enabled by setting bit 13 (EDPWRDOWN) of the [Port x PHY Mode Control/Status Register \(PHY_MODE_CONTROL_STATUS_x\)](#). When in this mode, if no energy is detected on the line, the entire PHY is powered down except for the PHY management control interface, the SQUELCH circuit, and the ENERGYON logic. The ENERGYON logic is used to detect the presence of valid energy from 100BASE-TX, 10BASE-T, or auto-negotiation signals and is responsible for driving the ENERGYON signal (bit 1) of the [Port x PHY Mode Control/Status Register \(PHY_MODE_CONTROL_STATUS_x\)](#).

In this mode, when the ENERGYON signal is cleared, the PHY is powered down and no data is transmitted from the PHY. When energy is received, via link pulses or packets, the ENERGYON signal goes high, and the PHY powers up. The PHY automatically resets itself into its previous state prior to power-down, and asserts the INT7 interrupt (bit 7) of the [Port x PHY Interrupt Source Flags Register \(PHY_INTERRUPT_SOURCE_x\)](#). The first and possibly second packet to activate ENERGYON may be lost.

When bit 13 (EDPWRDOWN) of the [Port x PHY Mode Control/Status Register \(PHY_MODE_CONTROL_STATUS_x\)](#) is low, energy detect power-down is disabled.

7.2.10 PHY Resets

In addition to the chip-level hardware reset (nRST) and Power-On Reset (POR), the PHY supports three block specific resets. These are discussed in the following sections. For detailed information on all LAN9313/LAN9313i resets and the reset sequence refer to [Section 4.2, "Resets," on page 41](#).

Note: The DIGITAL_RST bit in the [Reset Control Register \(RESET_CTL\)](#) does not reset the PHYs. Only a hardware reset (nRST) or an EEPROM RELOAD command will automatically reload the configuration strap values into the PHY registers. For all other PHY resets, these values will need to be manually configured via software.

7.2.10.1 PHY Software Reset via RESET_CTL

The PHY can be reset via the [Reset Control Register \(RESET_CTL\)](#). The Port 1 PHY is reset by setting bit 1 (PHY1_RST), and the Port 2 PHY is reset by setting bit 2 (PHY2_RST). These bits are self clearing after approximately 102µs. This reset does not reload the configuration strap values into the PHY registers.

7.2.10.2 PHY Software Reset via PHY_BASIC_CTRL_x

The PHY can also be reset by setting bit 15 (PHY_RST) of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#). This bit is self clearing and will return to 0 after the reset is complete. This reset does not reload the configuration strap values into the PHY registers.

7.2.10.3 PHY Power-Down Reset

After the PHY has returned from a power-down state, a reset of the PHY is automatically generated. The PHY power-down modes do not reload or reset the PHY registers. Refer to [Section 7.2.9, "PHY Power-Down Modes," on page 96](#) for additional information.

7.2.11 LEDs

Each PHY provides LED indication signals to the GPIO/LED block of the LAN9313/LAN9313i. This allows external LEDs to be used to indicate various PHY related functions such as TX/RX activity, speed, duplex, or link status. Refer to [Chapter 12, "GPIO/LED Controller," on page 142](#) for additional information on the configuration of these signals.

7.2.12 Required Ethernet Magnetics

The magnetics selected for use with the LAN9313/LAN9313i should be an Auto-MDIX style magnetic, which is widely available from several vendors. Please review the SMSC Application note 8.13 "Suggested Magnetics" for the latest qualified and suggested magnetics. A list of vendors and part numbers are provided within the application note.

7.3 Virtual PHY

The Virtual PHY provides a basic MII management interface (MDIO) to the MII management pins per the IEEE 802.3 (clause 22) so that a MAC with an unmodified driver can be supported as if the MAC was attached to a single port PHY. This functionality is designed to allow easy and quick integration of the LAN9313/LAN9313i into designs with minimal driver modifications. The Virtual PHY provides a full bank of registers which comply with the IEEE 802.3 specification. This enables the Virtual PHY to provide various status and control bits similar to those provided by a real PHY. These include the output of speed selection, duplex, loopback, isolate, collision test, and auto-negotiation status. For a list of all Virtual PHY registers and related bit descriptions, refer to [Section 13.2.1, "Virtual PHY Registers," on page 231](#).

7.3.1 Virtual PHY Auto-Negotiation

The purpose of the auto-negotiation function is to automatically configure the Virtual PHY to the optimum link parameters based on the capabilities of its link partner. Because the Virtual PHY has no actual link partner, the auto-negotiation process is emulated with deterministic results.

Auto-negotiation is enabled by setting bit 12 (VPHY_AN) of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) and is restarted by the occurrence of any of the following events:

- Power-On Reset (POR)
- Hardware reset (nRST)
- PHY Software reset (via bit 3 of the [Reset Control Register \(RESET_CTL\)](#), or bit 15 of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#))
- Setting the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#), bit 9 high (auto-neg restart)
- Digital Reset (via bit 10 of the [Reset Control Register \(RESET_CTL\)](#))
- Issuing an EEPROM Loader RELOAD command ([Section 8.2.4, "EEPROM Loader," on page 113](#))

The emulated auto-negotiation process is much simpler than the real process and can be categorized into three steps:

1. Bit 5 (Auto-Negotiation Complete) is set in the [Virtual PHY Basic Status Register \(VPHY_BASIC_STATUS\)](#).
2. Bit 1 (Page Received) is set in the [Virtual PHY Auto-Negotiation Expansion Register \(VPHY_AN_EXP\)](#).
3. The auto-negotiation result (speed and duplex) is determined and registered.

The auto-negotiation result (speed and duplex) is determined using the Highest Common Denominator (HCD) of the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) and [Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register \(VPHY_AN_LP_BASE_ABILITY\)](#) as specified in the IEEE 802.3 standard. The technology ability bits of these registers are ANDed, and if there are multiple bits in common, the priority is determined as follows:

Datasheet

- 100Mbps Full Duplex (highest priority)
- 100Mbps Half Duplex
- 10Mbps Full Duplex
- 10Mbps Half Duplex (lowest priority)

For example, if the full capabilities of the Virtual PHY are advertised (100Mbps, Full Duplex), and if the link partner is capable of 10Mbps and 100Mbps, then auto-negotiation selects 100Mbps as the highest performance mode. If the link partner is capable of half and full-duplex modes, then auto-negotiation selects full-duplex as the highest performance operation. In the event that there are no bits in common, an emulated [Parallel Detection](#) is used.

The [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) defaults to having all four ability bits set. These values can be reconfigured via software. Once the auto-negotiation is complete, any change to the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) will not take affect until the auto-negotiation process is re-run. The emulated link partner default advertised abilities in the [Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register \(VPHY_AN_LP_BASE_ABILITY\)](#) are dependant on the MII_DUPLEX pin and the duplex_pol_strap_mii and speed_strap_mii configuration straps as described in [Table 13.6 of Section 13.1.7.6, "Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register \(VPHY_AN_LP_BASE_ABILITY\)," on page 218](#). Neither the Virtual PHY or the emulated link partner support next page capability, remote faults, or 100BASE-T4.

Note: The MII_DUPLEX, duplex_pol_strap_mii, and speed_strap_mii inputs are considered to be static. Auto-negotiation is not automatically re-evaluated if these inputs are changed.

If there is at least one common selection between the emulated link partner and the Virtual PHY advertised abilities, then the auto-negotiation succeeds, the Link Partner Auto-Negotiation Able bit 0 of the [Virtual PHY Auto-Negotiation Expansion Register \(VPHY_AN_EXP\)](#) is set, and the technology ability bits in the [Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register \(VPHY_AN_LP_BASE_ABILITY\)](#) are set to indicate the emulated link partners abilities.

Note: For the Virtual PHY, the auto-negotiation register bits (and management of such) are used by the PMI. So the perception of local and link partner is reversed. The local device is the PMI, while the link partner is the switch fabric. This is consistent with the intention of the Virtual PHY.

7.3.1.1 Parallel Detection

In the event that there are no common bits between the advertised ability and the emulated link partners ability, auto-negotiation fails and emulated parallel detect is used. In this case, the Link Partner Auto-Negotiation Able (bit 0) in the [Virtual PHY Auto-Negotiation Expansion Register \(VPHY_AN_EXP\)](#) will be cleared, and the communication set to half-duplex. The speed is determined by the speed_strap_mii configuration strap. Only one of the technology ability bits in the [Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register \(VPHY_AN_LP_BASE_ABILITY\)](#) will be set, indicating the emulated parallel detect result.

7.3.1.2 Disabling Auto-Negotiation

Auto-negotiation can be disabled in the Virtual PHY by clearing bit 12 (VPHY_AN) of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#). The Virtual PHY will then force its speed of operation to reflect the speed (bit 13) and duplex (bit 8) of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#). The speed and duplex bits in the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) should be ignored when auto-negotiation is enabled.

7.3.1.3 Virtual PHY Pause Flow Control

The Virtual PHY supports pause flow control per the IEEE 802.3 specification. The Virtual PHYs advertised pause flow control abilities are set via bits 10 (Symmetric Pause) and 11 (Asymmetric Pause) of the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#). This allows the Virtual PHY to advertise its flow control abilities and auto-negotiate the flow control settings with the

emulated link partner. The default values of these bits are as shown in [Section 13.1.7.5, "Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)," on page 216.](#)

The symmetric/asymmetric pause ability of the emulated link partner is based upon the advertised pause flow control abilities of the Virtual PHY in (bits 10 & 11) of the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#). Thus, the emulated link partner always accommodates the asymmetric/symmetric pause ability settings requested by the Virtual PHY, as shown in [Table 13.5, "Emulated Link Partner Pause Flow Control Ability Default Values," on page 219.](#)

The pause flow control settings may also be manually set via the [Port 0\(External MII\) Manual Flow Control Register \(MANUAL_FC_MII\)](#). This register allows the switch fabric port 0 flow control settings to be manually set when auto-negotiation is disabled or the Manual Flow Control Select bit 0 is set. The currently enabled duplex and flow control settings can also be monitored via this register. The flow control values in the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) are not affected by the values of the manual flow control register. Refer to [Section 6.2.3, "Flow Control Enable Logic," on page 60](#) for additional information.

7.3.2 Virtual PHY in MAC Modes

In the MAC modes of operation, an external PHY is connected to the MII interface of the LAN9313/LAN9313i. Because there is an external PHY present, the Virtual PHY is not needed for external configuration. However, the port 0 switch fabric MAC still requires the proper duplex setting. Therefore, in MAC mode, if the auto-negotiation bit (VPHY_AN) of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) is set, the duplex is based on the MII_DUPLEX pin and duplex_pol_strap_mii configuration strap. If these signals are equal, the port 0 switch fabric MAC is configured for full-duplex, otherwise it is set for half-duplex. The MII_DUPLEX pin is typically connected to the duplex indication of the external PHY. The duplex is not latched since the auto-negotiation process is not used. The duplex can be manually selected by clearing the auto-negotiation bit (VPHY_AN) and controlling the duplex mode (VPHY_DUPLEX) bit in the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#).

Note: In MAC modes, the Virtual PHY registers are accessible through their memory mapped registers via the SMI, SPI, or I²C serial management interfaces only. The Virtual PHY registers are not accessible through MII management.

7.3.2.1 Full-Duplex Flow Control

In the MAC modes of operation, the Virtual PHY is not applicable. Therefore, full-duplex flow control should be controlled manually by the host via the [Port 0\(External MII\) Manual Flow Control Register \(MANUAL_FC_MII\)](#), based on the external PHYs auto-negotiation results.

7.3.3 Virtual PHY Resets

In addition to the chip-level hardware reset (nRST) and Power-On Reset (POR), the Virtual PHY supports two block specific resets. These are discussed in the following sections. For detailed information on all LAN9313/LAN9313i resets, refer to [Section 4.2, "Resets," on page 41.](#)

7.3.3.1 Virtual PHY Software Reset via RESET_CTL

The Virtual PHY can be reset via the [Reset Control Register \(RESET_CTL\)](#) by setting bit 3 (VPHY_RST). This bit is self clearing after approximately 102uS.

7.3.3.2 Virtual PHY Software Reset via VPHY_BASIC_CTRL

The Virtual PHY can also be reset by setting bit 15 (VPHY_RST) of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#). This bit is self clearing and will return to 0 after the reset is complete.

Chapter 8 Serial Management

8.1 Functional Overview

This chapter details the serial management functionality provided by the LAN9313/LAN9313i, which includes the EEPROM I²C/Microwire master, EEPROM Loader, SPI slave, and I²C slave controllers.

The I²C/Microwire EEPROM controller is an I²C/Microwire master module which interfaces an optional external EEPROM with the system register bus and the EEPROM Loader. Multiple types (I²C/Microwire) and sizes of external EEPROMs are supported. Configuration of the EEPROM type and size are accomplished via the `eeprom_type_strap` and `eeprom_size_strap[1:0]` configuration straps respectively. Various commands are supported for each EEPROM type, allowing for the storage and retrieval of static data. The I²C interface conforms to the Philips *I²C-Bus Specification*.

The EEPROM Loader provides the automatic loading of configuration settings from the EEPROM into the LAN9313/LAN9313i at reset, allowing the LAN9313/LAN9313i to operate unmanaged. The EEPROM Loader module interfaces to the EEPROM Controller, Ethernet PHYs, and the system CSRs.

The SPI/I²C slave controller can be used for CPU serial management and allows CPU access to all system CSRs. The SPI slave controller supports single register and multiple register read and write commands. The I²C slave controller implements the low level I²C slave serial interface (start and stop condition detection, data bit transmission/reception, and acknowledge generation/reception), handles the slave command protocol, and performs system register reads and writes. The I²C slave controller conforms to the Philips *I²C-Bus Specification*.

8.2 I²C/Microwire Master EEPROM Controller

Based on the configuration strap `eeprom_type_strap`, the I²C/Microwire EEPROM controller supports either Microwire or I²C compatible EEPROMs. The I²C/Microwire serial management pins functionality and characteristics differ dependant on the selected EEPROM type as summarized in [Table 8.1](#).

Table 8.1 I²C/Microwire Master Serial Management Pins Characteristics

EEPROM TYPE/MODE	EE_SDA/EEDI PIN	EEDO PIN	EECS PIN	EE_SCL/EECLK PIN
I ² C Master EEPROM Mode <code>eeprom_type_strap = 1</code>	EE_SDA Input enabled (to I ² C master) Open-drain output (from I ² C master) Pull-down disabled	NOT USED Input enabled (used for straps) Output enabled (driven low)	NOT USED Input enabled (used for straps) Output enabled (driven low)	EE_SCL Input enabled (to I ² C master and used for straps) Open-drain output (from I ² C master)
Microwire Master EEPROM Mode <code>eeprom_type_strap = 0</code>	EEDI Input enabled (to Microwire master) Output disabled Pull-down enabled	EEDO Input enabled (used for straps) Output enabled (from Microwire master)	EECS Input enabled (used for straps) Output enabled (from Microwire master)	EECLK Input enabled (used for straps) Output enabled (from Microwire master)

Note: When the EEPROM Loader is running, it has exclusive use of the I²C/Microwire EEPROM controller. Refer to [Section 8.2.4, "EEPROM Loader"](#) for more information.

8.2.1 EEPROM Controller Operation

I²C and Microwire master EEPROM operations are performed using the [EEPROM Command Register \(E2P_CMD\)](#) and [EEPROM Data Register \(E2P_DATA\)](#).

In Microwire EEPROM mode, the following operations are supported:

- ERASE (Erase Location)
- ERAL (Erase All)
- EWDS (Erase/Write Disable)
- EWEN (Erase/Write Enable)
- READ (Read Location)
- WRITE (Write Location)
- WRAL (Write All)
- RELOAD (EEPROM Loader Reload - See [Section 8.2.4, "EEPROM Loader"](#))

Note: In I²C EEPROM mode, only a sub-set of the above commands (READ, WRITE, and RELOAD) are supported.

Note: The EEPROM Loader uses the READ command only.

The supported commands of each mode are detailed in [Section 13.1.3.1, "EEPROM Command Register \(E2P_CMD\)," on page 160](#). Details specific to each EEPROM controller mode (I²C and Microwire) are explained in [Section 8.2.2, "I²C EEPROM"](#) and [Section 8.2.3, "Microwire EEPROM"](#) respectively.

When issuing a WRITE, or WRAL command, the desired data must first be written into the [EEPROM Data Register \(E2P_DATA\)](#). The WRITE or WRAL command may then be issued by setting the EPC_COMMAND field of the [EEPROM Command Register \(E2P_CMD\)](#) to the desired command value. If the operation is a WRITE, the EPC_ADDRESS field in the [EEPROM Command Register \(E2P_CMD\)](#) must also be set to the desired location. The command is executed when the EPC_BUSY bit of the [EEPROM Command Register \(E2P_CMD\)](#) is set. The completion of the operation is indicated when the EPC_BUSY bit is cleared.

When issuing a READ command, the EPC_COMMAND and EPC_ADDRESS fields of the [EEPROM Command Register \(E2P_CMD\)](#) must be configured with the desired command value and the read address, respectively. The READ command is executed by setting the EPC_BUSY bit of the [EEPROM Command Register \(E2P_CMD\)](#). The completion of the operation is indicated when the EPC_BUSY bit is cleared, at which time the data from the EEPROM may be read from the [EEPROM Data Register \(E2P_DATA\)](#).

Other EEPROM operations (EWDS, EWEN, ERASE, ERAL, RELOAD) are performed by writing the appropriate command into the EPC_COMMAND field of the [EEPROM Command Register \(E2P_CMD\)](#). The command is executed by setting the EPC_BUSY bit of the [EEPROM Command Register \(E2P_CMD\)](#). In all cases, the software must wait for the EPC_BUSY bit to clear before modifying the [EEPROM Command Register \(E2P_CMD\)](#).

Note: The EEPROM device powers-up in the erase/write disabled state. To modify the contents of the EEPROM, the EWEN command must first be issued.

If an operation is attempted and the EEPROM device does not respond within 30mS, the LAN9313/LAN9313i will time-out, and the EPC_TIMEOUT bit of the [EEPROM Command Register \(E2P_CMD\)](#) will be set.

Figure 8.1 illustrates the process required to perform an EEPROM read or write operation.

Figure 8.1 EEPROM Access Flow Diagram

8.2.2 I²C EEPROM

The I²C master implements a low level serial interface (start and stop condition generation, data bit transmission and reception, acknowledge generation and reception) for connection to I²C EEPROMs, and consists of a data wire (EE_SDA) and a serial clock (EE_SCL). The serial clock is driven by the master, while the data wire is bi-directional. Both signals are open-drain and require external pull-up resistors.

The serial clock is also used as an input as it can be held low by the slave device in order to wait-state the data cycle. Once the slave has data available or is ready to receive, it will release the clock. Assuming the masters clock low time is also expired, the clock will rise and the cycle will continue. In the event that the slave device holds the clock low for more than 30mS, the current command sequence is aborted and the EPC_TIMEOUT bit in the [EEPROM Command Register \(E2P_CMD\)](#) is set. Both the clock and data signals have Schmitt trigger inputs and digital input filters. The digital filters reject pulses that are less than 100nS.

Note: Since the I²C master is designed to access EEPROM only, multi-master arbitration is not supported.

Based on the configuration strap `eprom_size_strap`, various sized I²C EEPROMs are supported. The varying size ranges are supported by additional bits in the address field (EPC_ADDRESS) of the [EEPROM Command Register \(E2P_CMD\)](#). Within each size range, the largest EEPROM uses all the address bits, while the smaller EEPROMs treat the upper address bits as don't cares. The EEPROM

controller drives all the address bits as requested regardless of the actual size of the EEPROM. The supported size ranges for I²C operation are shown in [Table 8.2](#).

Table 8.2 I²C EEPROM Size Ranges

eeeprom_size_strap[0]	# OF ADDRESS BYTES	EEPROM SIZE	EEPROM TYPES
0	1 (Note 8.1)	16 x 8 through 2048 x 8	24xx00, 24xx01, 24xx02, 24xx04, 24xx08, 24xx16
1	2	4096 x 8 through 65536 x 8	24xx32, 24xx64, 24xx128, 24xx256, 24xx512

Note 8.1 Bits in the control byte are used as the upper address bits.

The I²C master interface runs at the standard-mode rate of 100KHz and is fully compliant with the Philips *I²C-Bus Specification*. Refer to the Philips *I²C-Bus Specification* for detailed timing information.

8.2.2.1 I²C Protocol Overview

I²C is a bi-directional 2-wire data protocol. A device that sends data is defined as a transmitter and a device that receives data is defined as a receiver. The bus is controlled by a master which generates the EE_SCL clock, controls bus access, and generates the start and stop conditions. Either the master or slave may operate as a transmitter or receiver as determined by the master.

The following bus states exist:

- **Idle:** Both EE_SDA and EE_SCL are high when the bus is idle.
- **Start & Stop Conditions:** A start condition is defined as a high to low transition on the EE_SDA line while EE_SCL is high. A stop condition is defined as a low to high transition on the EE_SDA line while EE_SCL is high. The bus is considered to be busy following a start condition and is considered free 4.7uS/1.3uS (for 100KHz and 400KHz operation, respectively) following a stop condition. The bus stays busy following a repeated start condition (instead of a stop condition). Starts and repeated starts are otherwise functionally equivalent.
- **Data Valid:** Data is valid, following the start condition, when EE_SDA is stable while EE_SCL is high. Data can only be changed while the clock is low. There is one valid bit per clock pulse. Every byte must be 8 bits long and is transmitted msb first.
- **Acknowledge:** Each byte of data is followed by an acknowledge bit. The master generates a ninth clock pulse for the acknowledge bit. The transmitter releases EE_SDA (high). The receiver drives EE_SDA low so that it remains valid during the high period of the clock, taking into account the setup and hold times. The receiver may be the master or the slave depending on the direction of the data. Typically the receiver acknowledges each byte. If the master is the receiver, it does not generate an acknowledge on the last byte of a transfer. This informs the slave to not drive the next byte of data so that the master may generate a stop or repeated start condition.

Figure 8.2 displays the various bus states of a typical I²C cycle.

Figure 8.2 I²C Cycle

8.2.2.2 I²C EEPROM Device Addressing

The I²C EEPROM is addressed for a read or write operation by first sending a control byte followed by the address byte or bytes. The control byte is preceded by a start condition. The control byte and address byte(s) are each acknowledged by the EEPROM slave. If the EEPROM slave fails to send an acknowledge, then the sequence is aborted and the EPC_TIMEOUT bit of the EEPROM Command Register (E2P_CMD) is set.

The control byte consists of a 4-bit control code, 3-bits of chip/block select and one direction bit. The control code is 1010b. For single byte addressing EEPROMs, the chip/block select bits are used for address bits 10, 9, and 8. For double byte addressing EEPROMs, the chip/block select bits are set low. The direction bit is set low to indicate the address is being written.

Figure 8.3 illustrates typical I²C EEPROM addressing bit order for single and double byte addressing.

Figure 8.3 I²C EEPROM Addressing

8.2.2.3 I²C EEPROM Byte Read

Following the device addressing, a data byte may be read from the EEPROM by outputting a start condition and control byte with a control code of 1010b, chip/block select bits as described in [Section 8.2.2.2](#), and the R/~W bit high. The EEPROM will respond with an acknowledge, followed by 8-bits of data. If the EEPROM slave fails to send an acknowledge, then the sequence is aborted and the EPC_TIMEOUT bit in the [EEPROM Command Register \(E2P_CMD\)](#) is set. The I²C master then sends a no-acknowledge, followed by a stop condition.

Figure 8.4 illustrates typical I²C EEPROM byte read for single and double byte addressing.

Figure 8.4 I²C EEPROM Byte Read

For a register level description of a read operation, refer to [Section 8.2.1, "EEPROM Controller Operation,"](#) on page 102.

8.2.2.4 I²C EEPROM Sequential Byte Reads

Following the device addressing, data bytes may be read sequentially from the EEPROM by outputting a start condition and controlling byte with a control code of 1010b, chip/block select bits as described in [Section 8.2.2.2](#), and the R/~W bit high. The EEPROM will respond with an acknowledge, followed by 8-bits of data. If the EEPROM slave fails to send an acknowledge, then the sequence is aborted and the EPC_TIMEOUT bit in the [EEPROM Command Register \(E2P_CMD\)](#) is set. The I²C master then sends an acknowledge, and the EEPROM responds with the next 8-bits of data. This continues until the last desired byte is read, at which point the I²C master sends a no-acknowledge, followed by a stop condition.

Figure 8.4 illustrates typical I²C EEPROM sequential byte reads for single and double byte addressing.

Figure 8.5 I²C EEPROM Sequential Byte Reads

Datasheet

Sequential reads are used by the EEPROM Loader. Refer to [Section 8.2.4, "EEPROM Loader"](#) for additional information.

For a register level description of a read operation, refer to [Section 8.2.1, "EEPROM Controller Operation,"](#) on page 102.

8.2.2.5 I²C EEPROM Byte Writes

Following the device addressing, a data byte may be written to the EEPROM by outputting the data after receiving the acknowledge from the EEPROM. The data byte is acknowledged by the EEPROM slave and the I²C master finishes the write cycle with a stop condition. If the EEPROM slave fails to send an acknowledge, then the sequence is aborted and the EPC_TIMEOUT bit in the [EEPROM Command Register \(E2P_CMD\)](#) is set.

Following the data byte write cycle, the I²C master will poll the EEPROM to determine when the byte write is finished. A start condition is sent followed by a control byte with a control code of 1010b, chip/block select bits low, and the R/~W bit low. If the EEPROM is finished with the byte write, it will respond with an acknowledge. Otherwise, it will respond with a no-acknowledge and the I²C master will repeat the poll. If the acknowledge does not occur within 30mS, a time-out occurs. Once the I²C master receives the acknowledge, it concludes by sending a start condition, followed by a stop condition, which will place the EEPROM into standby.

Figure 8.4 illustrates typical I²C EEPROM byte write.

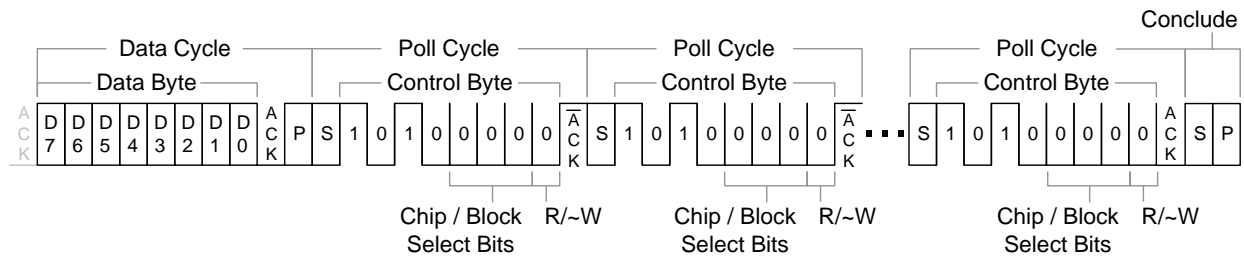

Figure 8.6 I²C EEPROM Byte Write

For a register level description of a write operation, refer to [Section 8.2.1, "EEPROM Controller Operation,"](#) on page 102.

8.2.3 Microwire EEPROM

Based on the configuration strap `eprom_type_strap`, various sized Microwire EEPROMs are supported. The varying size ranges are supported by additional bits in the address field (`EPC_ADDRESS`) of the [EEPROM Command Register \(E2P_CMD\)](#). Within each size range, the largest EEPROM uses all the address bits, while the smaller EEPROMs treat the upper address bits as don't cares. The EEPROM controller drives all the address bits as requested regardless of the actual size of the EEPROM. The supported size ranges for Microwire operation are shown in [Table 8.3](#).

Table 8.3 Microwire EEPROM Size Ranges

<code>eprom_size_strap[1:0]</code>	# OF ADDRESS BITS	EEPROM SIZE	EEPROM TYPES
00	7	128 x 8	93xx46A
01	9	256 x 8 and 512 x 8	93xx56A, 93xx66A
10	11	1024 x 8 and 2048 x 8	93xx76A, 93xx86A
11	RESERVED		

Refer to [Section 14.5.4, "Microwire Timing,"](#) on page 392 for detailed Microwire timing information.

8.2.3.1 Microwire Master Commands

[Table 8.4](#), [Table 8.5](#), and [Table 8.6](#) detail the Microwire command set, including the number of clock cycles required, for 7, 9, and 11 address bits respectively. These commands are detailed in the following sections as well as in [Section 13.1.3.1, "EEPROM Command Register \(E2P_CMD\),"](#) on page 160.

Table 8.4 Microwire Command Set for 7 Address Bits

INST	START BIT	OPCODE	ADDRESS	DATA TO EEPROM	DATA FROM EEPROM	# OF CLOCKS
ERASE	1	11	A6 A5 A4 A3 A2 A1 A0	-	(RDY/~BSY)	10

READ	1	10	A10 A9 A8 A7 A6 A5 A4 A3 A2 A1 A0	-	D7 - D0	22
WRITE	1	01	A10 A9 A8 A7 A6 A5 A4 A3 A2 A1 A0	D7 - D0	(RDY/~BSY)	22
WRAL	1	00	0 1 X X X X X X X X X	D7 - D0	(RDY/~BSY)	22

8.2.3.2 ERASE (Erase Location)

If erase/write operations are enabled in the EEPROM, this command will erase the location selected by the EPC_ADDRESS field of the [EEPROM Command Register \(E2P_CMD\)](#). The EPC_TIMEOUT bit is set if the EEPROM does not respond within 30mS.

Figure 8.7 EEPROM ERASE Cycle

8.2.3.3 ERAL (Erase All)

If erase/write operations are enabled in the EEPROM, this command will initiate a bulk erase of the entire EEPROM. The EPC_TIMEOUT bit of the [EEPROM Command Register \(E2P_CMD\)](#) is set if the EEPROM does not respond within 30mS.

Figure 8.8 EEPROM ERAL Cycle

8.2.3.4 EWDS (Erase/Write Disable)

After this command is issued, the EEPROM will ignore erase and write commands. To re-enable erase/write operations, the EWEN command must be issued.

Figure 8.9 EEPROM EWDS Cycle

Datasheet

8.2.3.5 EWEN (Erase/Write Enable)

This command enables the EEPROM for erase and write operations. The EEPROM will allow erase and write operations until the EWDS command is sent, or until power is cycled.

Note: The EEPROM will power-up in the erase/write disabled state. Any erase or write operations will fail until an EWEN command is issued.

Figure 8.10 EEPROM EWEN Cycle

8.2.3.6 READ (Read Location)

This command will cause a read of the EEPROM location pointed to by the EPC_ADDRESS field of the EEPROM Command Register (E2P_CMD). The result of the read is available in the EEPROM Data Register (E2P_DATA).

Figure 8.11 EEPROM READ Cycle

8.2.3.7 WRITE (Write Location)

If erase/write operations are enabled in the EEPROM, this command will cause the contents of the [EEPROM Data Register \(E2P_DATA\)](#) to be written to the EEPROM location pointed to by the EPC_ADDRESS field of the [EEPROM Command Register \(E2P_CMD\)](#). The EPC_TIMEOUT bit of the [EEPROM Command Register \(E2P_CMD\)](#) is set if the EEPROM does not respond within 30mS.

Figure 8.12 EEPROM WRITE Cycle

8.2.3.8 WRAL (Write All)

If erase/write operations are enabled in the EEPROM, this command will cause the contents of the [EEPROM Data Register \(E2P_DATA\)](#) to be written to every EEPROM memory location. The EPC_TIMEOUT bit of the [EEPROM Command Register \(E2P_CMD\)](#) is set if the EEPROM does not respond within 30mS.

Figure 8.13 EEPROM WRAL Cycle

Datasheet

8.2.4 EEPROM Loader

The EEPROM Loader interfaces to the I²C/Microwire EEPROM controller, the PHYs, and to the system CSRs (via the Register Access MUX). All system CSRs are accessible to the EEPROM Loader.

The EEPROM Loader runs upon a pin reset (nRST), power-on reset (POR), digital reset (DIGITAL_RST bit in the [Reset Control Register \(RESET_CTL\)](#)), or upon the issuance of a RELOAD command via the [EEPROM Command Register \(E2P_CMD\)](#). Refer to [Section 4.2, "Resets," on page 41](#) for additional information on the LAN9313/LAN9313i resets.

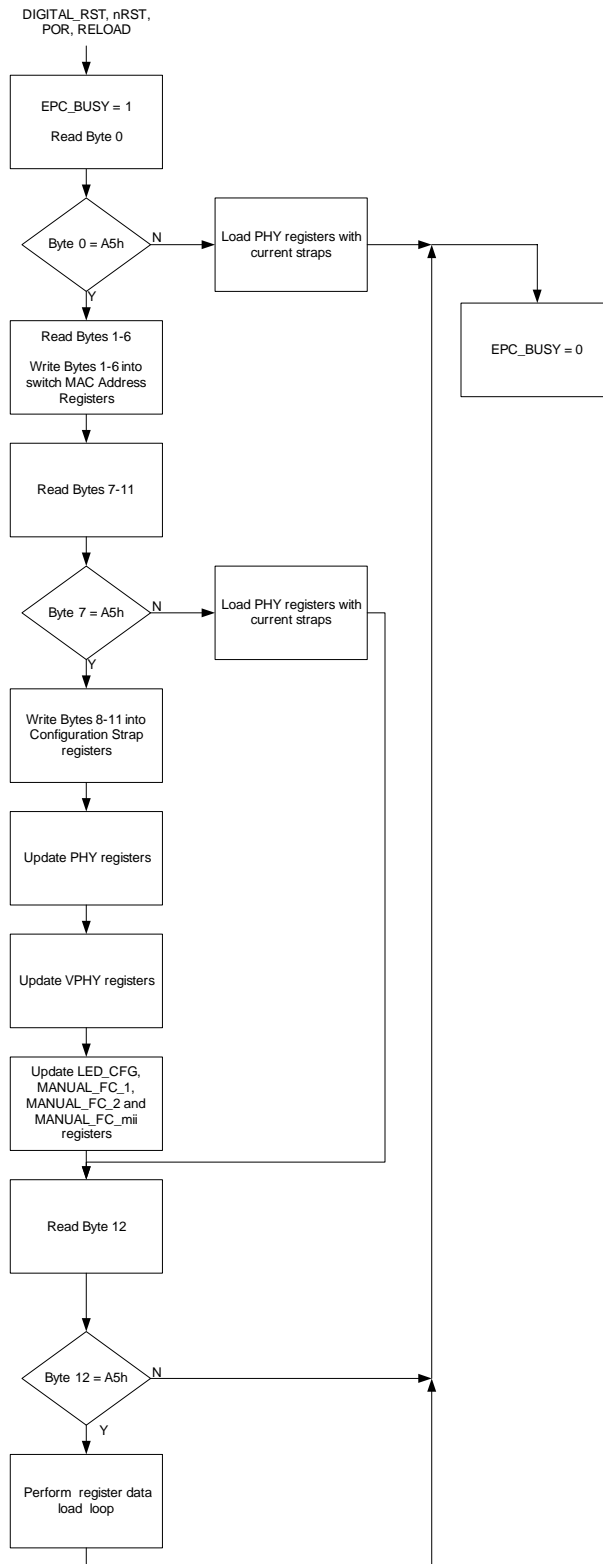

The EEPROM contents must be loaded in a specific format for use with the EEPROM Loader. An overview of the EEPROM content format is shown in [Table 8.7](#). Each section of EEPROM contents is discussed in detail in the following sections.

Table 8.7 EEPROM Contents Format Overview

EEPROM ADDRESS	DESCRIPTION	VALUE
0	EEPROM Valid Flag	A5h
1	MAC Address Low Word [7:0]	1 st Byte on the Network
2	MAC Address Low Word [15:8]	2 nd Byte on the Network
3	MAC Address Low Word [23:16]	3 rd Byte on the Network
4	MAC Address Low Word [31:24]	4 th Byte on the Network

8.2.4.1 EEPROM Loader Operation

Upon a pin reset (nRST), power-on reset (POR), digital reset (DIGITAL_RST bit in the [Reset Control Register \(RESET_CTL\)](#)), or upon the issuance of a RELOAD command via the [EEPROM Command Register \(E2P_CMD\)](#), the EPC_BUSY bit in the [EEPROM Command Register \(E2P_CMD\)](#) will be set. While the EEPROM Loader is active, the READY bit of the [Hardware Configuration Register \(HW_CFG\)](#) is cleared and no writes to the LAN9313/LAN9313i should be attempted. The operational flow of the EEPROM Loader can be seen in [Figure 8.14](#).

Figure 8.14 EEPROM Loader Flow Diagram

Datasheet

8.2.4.2 EEPROM Valid Flag

Following the release of nRST, POR, DIGITAL_RST, or a RELOAD command, the EEPROM Loader starts by reading the first byte of data from the EEPROM. If the value of A5h is not read from the first byte, the EEPROM Loader will load the current configuration strap values into the PHY registers (see [Section 8.2.4.4.1](#)) and then terminate, clearing the EPC_BUSY bit in the [EEPROM Command Register \(E2P_CMD\)](#). Otherwise, the EEPROM Loader will continue reading sequential bytes from the EEPROM.

8.2.4.3 MAC Address

The next six bytes in the EEPROM, after the EEPROM Valid Flag, are written into the [Switch Fabric MAC Address High Register \(SWITCH_MAC_ADDRH\)](#) and [Switch Fabric MAC Address Low Register \(SWITCH_MAC_ADDRL\)](#). The EEPROM bytes are written into the MAC address registers in the order specified in [Table 8.7](#).

8.2.4.4 Soft-Straps

The 7th byte of data to be read from the EEPROM is the Configuration Strap Values Valid Flag. If this byte has a value of A5h, the next 4 bytes of data (8-11) are written into the configuration strap registers per the assignments detailed in [Table 8.8](#). If the flag byte is not A5h, these next 4 bytes are skipped (they are still read to maintain the data burst, but are discarded). However, the current configuration strap values are still loaded into the PHY registers (see [Section 8.2.4.4.1](#)). Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for more information on the LAN9313/LAN9313i configuration straps.

Table 8.8 EEPROM Configuration Bits

BYTE/BIT	7	6	5	4	3	2	1	0
Byte 8	BP_EN_strap_1	FD_FC_strap_1	manual_FC_strap_1	manual_mdix_strap_1	auto_mdix_strap_1	speed_strap_1	duplex_strap_1	autoneg_strap_1
Byte 9	BP_EN_strap_2	FD_FC_strap_2	manual_FC_strap_2	manual_mdix_strap_2	auto_mdix_strap_2	speed_strap_2	duplex_strap_2	autoneg_strap_2
Byte 10	LED_fun_strap[1:0]		BP_EN_strap_mii	FD_FC_strap_mii	manual_FC_strap_mii	speed_strap_mii	duplex_pol_strap_mii	SQE_test_disable_strap_mii
Byte 11	LED_en_strap[7:0]							

8.2.4.4.1 PHY REGISTERS SYNCHRONIZATION

Some PHY register defaults are based on configuration straps. In order to maintain consistency between the updated configuration strap registers and the PHY registers, the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#), [Port x PHY Special Modes Register \(PHY_SPECIAL_MODES_x\)](#), and [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) are written when the EEPROM Loader is run.

The [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) is written with the new defaults as detailed in [Section 13.2.2.5, "Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)," on page 239](#).

The [Port x PHY Special Modes Register \(PHY_SPECIAL_MODES_x\)](#) is written with the new defaults as detailed in [Section 13.2.2.9, "Port x PHY Special Modes Register \(PHY_SPECIAL_MODES_x\)," on page 246](#).

The [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) is written with the new defaults as detailed in [Section 13.2.2.1, "Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)," on page 233](#). Additionally, the Restart Auto-negotiation bit is set in this register. This re-runs the Auto-negotiation using the new default values of the [Port x PHY Auto-Negotiation Advertisement Register \(PHY_AN_ADV_x\)](#) register to determine the new Auto-negotiation results.

Note: Each of these PHY registers is written in its entirety, overwriting any previously changed bits.

8.2.4.4.2 VIRTUAL PHY REGISTERS SYNCHRONIZATION

Some PHY register defaults are based on configuration straps. In order to maintain consistency between the updated configuration strap registers and the Virtual PHY registers, the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#), [Virtual PHY Special Control/Status Register \(VPHY_SPECIAL_CONTROL_STATUS\)](#), and [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) are written when the EEPROM Loader is run.

The [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) is written with the new defaults as detailed in [Section 13.1.7.5, "Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)," on page 216.](#)

The [Virtual PHY Special Control/Status Register \(VPHY_SPECIAL_CONTROL_STATUS\)](#) is written with the new defaults as detailed in [Section 13.1.7.8, "Virtual PHY Special Control/Status Register \(VPHY_SPECIAL_CONTROL_STATUS\)," on page 222.](#)

The [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) is written with the new defaults as detailed in [Section 13.1.7.1, "Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)," on page 210.](#) Additionally, the Restart Auto-negotiation bit is set in this register. This re-runs the Auto-negotiation using the new default values of the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#) register to determine the new Auto-negotiation results.

Note: Each of these VPHY registers is written in its entirety, overwriting any previously changed bits.

8.2.4.4.3 LED AND MANUAL FLOW CONTROL REGISTER SYNCHRONIZATION

Since the defaults of the [LED Configuration Register \(LED_CFG\)](#), [Port 1 Manual Flow Control Register \(MANUAL_FC_1\)](#), [Port 2 Manual Flow Control Register \(MANUAL_FC_2\)](#), and [Port 0\(External MII\) Manual Flow Control Register \(MANUAL_FC_MII\)](#) are based on configuration straps, the EEPROM Loader reloads these registers with their new default values.

8.2.4.5 Register Data

Optionally following the configuration strap values, the EEPROM data may be formatted to allow access to the LAN9313/LAN9313i parallel, directly writable registers. Access to indirectly accessible registers (e.g. Switch Engine registers, etc.) is achievable with an appropriate sequence of writes (at the cost of EEPROM space).

This data is first preceded with a Burst Sequence Valid Flag (EEPROM byte 12). If this byte has a value of A5h, the data that follows is recognized as a sequence of bursts. Otherwise, the EEPROM Loader is finished, will go into a wait state, and clear the EPC_BUSY bit in the [EEPROM Command Register \(E2P_CMD\)](#). This can optionally generate an interrupt.

The data at EEPROM byte 13 and above should be formatted in a sequence of bursts. The first byte is the total number of bursts. Following this is a series of bursts, each consisting of a starting address, count, and the count x 4 bytes of data. This results in the following formula for formatting register data:

```

8-bits number_of_bursts
repeat (number_of_bursts)
    16-bits {starting_address[9:2] / count[7:0]}
    repeat (count)
        8-bits data[31:24], 8-bits data[23:16], 8-bits data[15:8], 8-bits data[7:0]
    
```

Note: The starting address is a DWORD address. Appending two 0 bits will form the register address.

Datasheet

As an example, the following is a 3 burst sequence, with 1, 2, and 3 DWORDs starting at register addresses 40h, 80h, and C0h respectively:

A5h, (Burst Sequence Valid Flag)

3h, (number_of_bursts)

16{10h, 1h}, (starting_address1 divided by 4 / count1)

11h, 12h, 13h, 14h, (4 x count1 of data)

16{20h, 2h}, (starting_address2 divided by 4 / count2)

21h, 22h, 23h, 24h, 25h, 26h, 27h, 28h, (4 x count2 of data)

16{30h, 3h}, (starting_address3 divided by 4 / count3)

31h, 32h, 33h, 34h, 35h, 36h, 37h, 38h, 39h, 3Ah, 3Bh, 3Ch (4 x count3 of data)

In order to avoid overwriting the Switch CSR register interface or the PHY Management Interface (PMI), the EEPROM Loader waits until the CSR Busy bit of the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) and the MII Busy bit of the [PHY Management Interface Access Register \(PMI_ACCESS\)](#) are cleared before performing any register write.

The EEPROM Loader checks that the EEPROM address space is not exceeded. If so, it will stop and set the EEPROM Loader Address Overflow bit in the [EEPROM Command Register \(E2P_CMD\)](#). The address limit is based on the eeprom_size_strap which specifies a range of sizes. The address limit is set to the largest value of the specified range.

8.2.4.6 EEPROM Loader Finished Wait-State

Once finished with the last burst, the EEPROM Loader will go into a wait-state and the EPC_BUSY bit of the [EEPROM Command Register \(E2P_CMD\)](#) will be cleared.

8.2.4.7 Reset Sequence and EEPROM Loader

In order to allow the EEPROM Loader to change the Port 1/2 PHYs and Virtual PHY strap inputs and maintain consistency with the PHY and Virtual PHY registers, the following sequence is used:

1. After power-up or upon a hardware reset (nRST), the straps are sampled into the LAN9313/LAN9313i as specified in [Section 14.5.2, "Reset and Configuration Strap Timing," on page 390](#).
2. After the PLL is stable, the main chip reset is released and the EEPROM Loader reads the EEPROM and configures (overrides) the strap inputs.
3. The EEPROM Loader writes select Port 1/2 and Virtual PHY registers, as specified in [Section 8.2.4.4.1](#) and [Section 8.2.4.4.2](#), respectively.

Note: Step 3 is also performed in the case of a RELOAD command or digital reset.

8.3 SPI/I²C Slave Controller

The SPI/I²C slave controller functionality is dependant on the management mode of the LAN9313/LAN9313i. When in MAC/PHY I²C managed modes, the I²C controller is enabled. When in MAC/PHY SPI managed modes, the SPI controller is enabled. The SPI/I²C serial management pins functionality and characteristics differ dependant on the selected modes as summarized in [Table 8.9](#).

Table 8.9 SPI / I²C Slave Serial Management Pins Characteristics

MODE(S)	SI/SDA PIN	SO PIN	nSCS PIN	SCK/SCL PIN
MAC/PHY Modes Unmanaged MAC/PHY Modes SMI Managed	NOT USED Input disabled Output disabled Pull-up enabled	NOT USED Output enabled (driven low)	NOT USED Input disabled Pull-up enabled	NOT USED Input disabled Pull-up enabled
MAC/PHY Modes SPI Managed	SI Input to SPI slave Output disabled Pull-up enabled	SO Three-state output from SPI slave	nSCS Input to SPI slave Pull-up enabled	SCK Input to SPI slave Pull-up enabled
MAC/PHY Modes I ² C Managed	SDA Input to I ² C slave Open-drain output from I ² C slave Pull-up disabled	NOT USED Output enabled (driven low)	NOT USED Input disabled Pull-up enabled	SCL Input to I ² C slave Pull-up disabled

Details on the various management modes and their configuration settings are provided in [Section 2.3](#), "Modes of Operation," on page 23.

8.4 SPI Slave Operation

When in MAC/PHY SPI managed mode, the SPI slave interface is used for CPU management of the LAN9313/LAN9313i. All system CSRs are accessible to the CPU in these modes. SPI mode is selected when the `mngt_mode_strap[1:0]` inputs are set to 11b. The SPI slave interface supports single register and multiple register read and write commands. Multiple read and multiple write commands support incrementing, decrementing, and static addressing.

Input data on the SI pin is sampled on the rising edge of the SCK input clock. Output data is sourced on the SO pin with the falling edge of the clock. The SCK input clock can be either an active high pulse or an active low pulse. When the nSCS chip select input is high, the SI input pin is ignored and the SO output pin is three-stated.

A read or write command is started on the first rising edge of the input clock after nSCS goes low. An 8-bit instruction is then driven onto the line followed by an 8-bit register address field. All registers are accessed as DWORDs. Appending two 0 bits to the address field will form the register address. This is followed by one or more 32-bit data fields. All registers are accessed as DWORDs. All instructions, addresses and data are transferred with the most-significant bit (msb) first. Data is transferred with the most-significant byte (MSB) first (little endian).

The SPI interface supports up to a 10MHz input clock. A detailed SPI timing diagram is provided in [Section 14.5.5](#), "SPI Slave Timing," on page 393.

Datasheet

The SPI instructions supported by the LAN9313/LAN9313i are listed in [Table 8.10](#). Unsupported instructions are must not be used.

Table 8.10 Supported SPI Instructions

INSTRUCTION	FORMAT	DESCRIPTION
READ	0000 0011	Read register at the specified address. Multiple reads maintain the same address.
READ_INC	0000 0111	Read register(s) starting at the specified address. Multiple reads auto-increment address.
READ_DEC	0000 1011	Read register(s) starting at the specified address. Multiple reads auto-decrement address.
WRITE	0000 0010	Write register at the specified address. Multiple writes maintain the same address.
WRITE_INC	0000 0110	Write register(s) starting at the specified address. Multiple writes auto-increment address.
WRITE_DEC	0000 1010	Write register(s) starting at the specified address. Multiple writes auto-decrement address.

8.4.1 SPI Read Sequence

The SPI slave interface of the LAN9313/LAN9313i is selected for reads by first bringing nSCS low. The SI pin should then driven with an 8-bit read instruction, followed by the 8-bit address. On the falling clock edge which follows the rising edge of the last address bit, the SO output is driven starting with the msb of the selected register. The remaining register bits are shifted out on subsequent falling clock edges.

Multiple reads are performed by continuing the clock pulses while nSCS is low. Depending on the instruction (as shown in [Table 8.10](#)), the internal address is incremented, decremented, or maintained. Maintaining a fixed internal address is useful for register polling. For auto-incrementing instructions, once the internal address reaches its maximum, it rolls over to 0. For auto-decrementing instructions, once the internal address reaches 0, it rolls over to its maximum.

The nSCS input is brought high to conclude the cycle. The SO output pin is three-stated at this time.

Since data is read serially, register values are latched (registered) at the beginning of each 32-bit read to prevent the host from reading an intermediate value. The latching occurs multiple times in a multiple read sequence. In addition, any register that is affected by a read operation (e.g. a clear on read bit) is not cleared until after all 32-bits are output. In the event that 32-bits are not read when the nSCS is returned high, the read is considered invalid and the register is not affected. Multiple registers may be cleared in a multiple read cycle, each one being cleared as it is read.

SPI reads from unused register addresses return as all zeros.

Figure 8.1 illustrates a typical single and multiple register read.

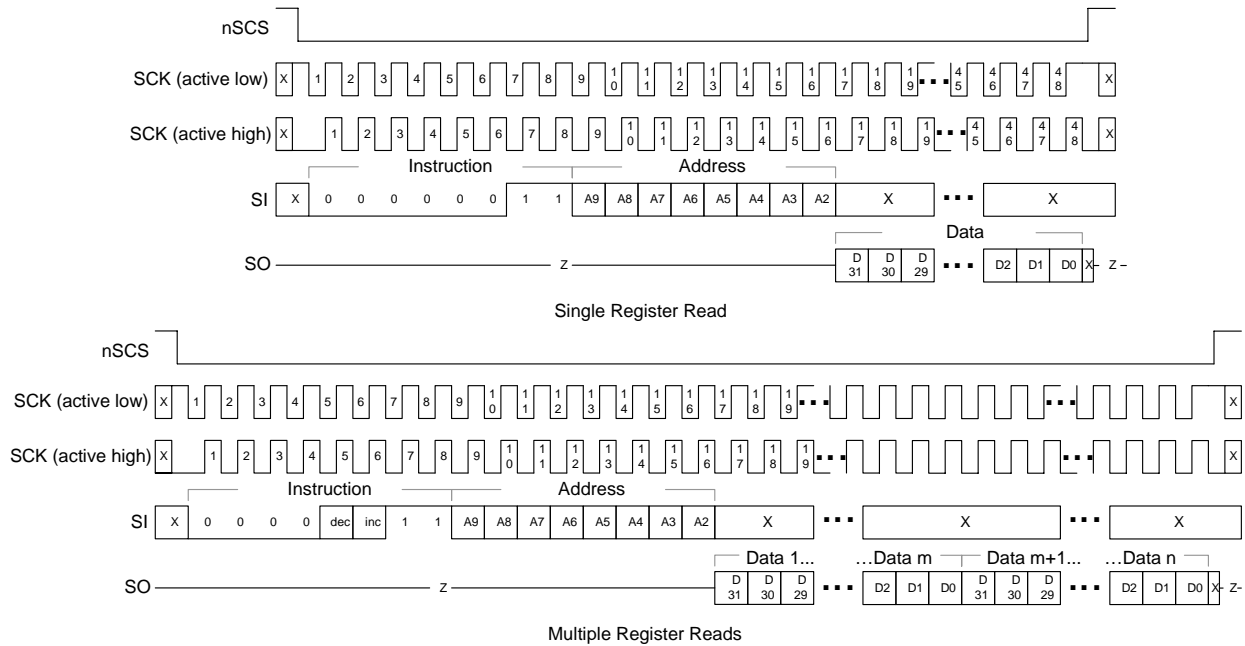

Figure 8.1 SPI Reads

8.4.1.1 SPI Read Polling for Reset Complete

During reset, the SPI slave interface will not return valid data. To determine when the reset condition is complete, the [Byte Order Test Register \(BYTE_TEST\)](#) should be polled. Once the correct pattern is read, the interface can be considered functional. At this point, the [READY](#) bit in the [Hardware Configuration Register \(HW_CFG\)](#) can be polled to determine when the device initialization is complete. Refer to [Section 4.2, "Resets," on page 41](#) for additional information.

8.4.2 SPI Write Sequence

The SPI slave interface of the LAN9313/LAN9313i is selected for writes by first bringing nSCS low. The SI pin should then driven with an 8-bit write instruction, followed by the 8-bit address and then the data.

Multiple writes are performed by continuing the clock pulses and input data while nSCS is low. Depending on the instruction (as shown in [Table 8.10](#)), the internal address is incremented, decremented, or maintained. Maintaining an fixed internal address is useful for “bit-banging”. For auto-incrementing instructions, once the internal address reaches its maximum, it rolls over to 0. For auto-decrementing instructions, once the internal address reaches 0, it rolls over to its maximum.

The nSCS input is brought high to conclude the cycle. The SO output is three-stated throughout the entire write sequence.

The data write to the register occurs after the 32-bits are input. In the event that 32-bits are not written when the nSCS is returned high, the write is considered invalid and the register is not affected. Multiple registers may be written in a multiple write cycle, each one being written after 32-bits.

SPI writes must not be performed to unused register addresses.

Figure 8.2 illustrates a typical single and multiple register write.

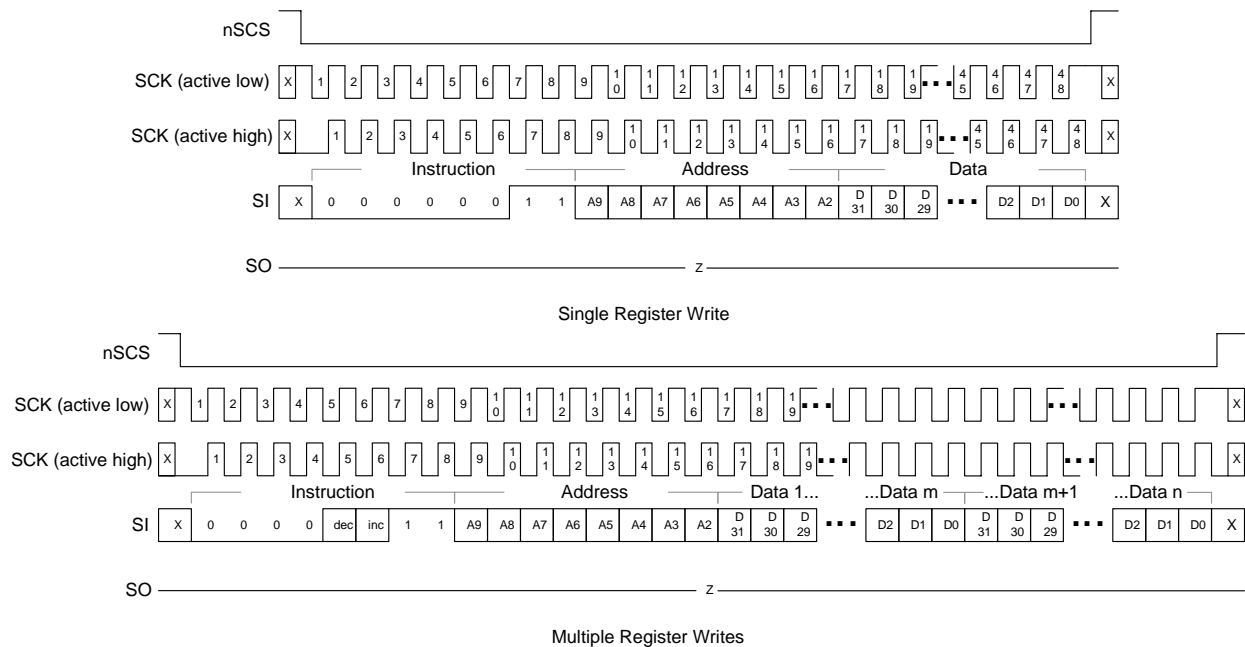

Figure 8.2 SPI Writes

8.5 I²C Slave Operation

When in MAC/PHY I²C managed mode, the I²C slave interface is used for CPU management of the LAN9313/LAN9313i. All system CSRs are accessible to the CPU in these modes. I²C mode is selected when the `mngt_mode_strap[1:0]` inputs are set to 10b. The I²C slave controller implements the low level I²C slave serial interface (start and stop condition detection, data bit transmission and reception, and acknowledge generation and reception), handles the slave command protocol, and performs system register reads and writes. The I²C slave controller conforms to the Philips *I²C-Bus Specification*.

The I²C slave serial interface consists of a data wire (SDA) and a serial clock (SCL). The serial clock is driven by the master, while the data wire is bi-directional. Both signals are open-drain and require external pull-up resistors. Both signals include Schmitt trigger inputs and digital input filters. The digital filters reject pulses that are less than 100nS.

The I²C slave serial interface supports the standard-mode speed of up to 100KHz and the fast-mode speed of 400KHz. Refer to the Philips *I²C-Bus Specification* for detailed I²C timing information.

8.5.1 I²C Slave Command Format

The I²C slave serial interface supports single register and multiple register read and write commands. A read or write command is started by the master first sending a start condition, followed by a control byte. The control byte consists of a 7-bit slave address and a 1-bit read/write indication (R/~W). The slave address used by the LAN9313/LAN9313i is 0001010b, written as SA6 (first bit on the wire) through SA0 (last bit on the wire). Assuming the slave address in the control byte matches this address, the control byte is acknowledged by the LAN9313/LAN9313i. Otherwise, the entire sequence is ignored until the next start condition. The I²C command format can be seen in Figure 8.3.

If the read/write indication (R/~W) in the control byte is a 0 (indicating a potential write), the next byte sent by the master is the register address. After the address byte is acknowledged by the

LAN9313/LAN9313i, the master may either send data bytes to be written, or it may send another start condition (to start the reading of data), or a stop condition. The latter two will terminate the current write (without writing any data), but will have the affect of setting the internal register address which will be used for subsequent reads.

If the read/write indication in the control byte is a 1 (indicating a read), the LAN9313/LAN9313i will start sending data following the control byte acknowledgement.

Note: All registers are accessed as DWORDs. Appending two 0 bits to the address field will form the register address. Addresses and data are transferred msb first. Data is transferred MSB first (little endian).

Figure 8.3 I²C Slave Addressing

8.5.2 I²C Slave Read Sequence

Following the device addressing, as detailed in [Section 8.5.1](#), a register is read from the LAN9313/LAN9313i when the master sends a start condition and control byte with the R/~W bit set. Assuming the slave address in the control byte matches the LAN9313/LAN9313i address, the control byte is acknowledged by the LAN9313/LAN9313i. Otherwise, the entire sequence is ignored until the next start condition. Following the acknowledge, the LAN9313/LAN9313i sends 4 bytes of data. The first 3 bytes are acknowledged by the master and on the fourth, the master sends a no-acknowledge followed by the stop condition. The no-acknowledge informs the LAN9313/LAN9313i not to send the next 4 bytes (as it would in the case of a multiple read). The internal register address is unchanged following the single read.

Multiple reads are performed when the master sends an acknowledge on the fourth byte. The internal address is incremented and the next register is shifted out. Once the internal address reaches its maximum, it rolls over to 0. The multiple read is concluded when the master sends a no-acknowledge followed by a stop condition. The no-acknowledge informs the LAN9313/LAN9313i not to send the next 4 bytes. The internal register address is incremented for each read including the final.

For both single and multiple reads, in the case that the master sends a no-acknowledge on any of the first three bytes of the register, the LAN9313/LAN9313i will stop sending subsequent bytes. If the master sends an unexpected start or stop condition, the LAN9313/LAN9313i will stop sending immediately and will respond to the next sequence as needed.

Since data is read serially, register values are latched (registered) at the beginning of each 32-bit read to prevent the host from reading an intermediate value. The latching occurs multiple times in a multiple read sequence. In addition, any register that is affected by a read operation (e.g. a clear on read bit) is not cleared until after all 32-bits are output. In the event that 32-bits are not read (master sends a no-acknowledge on one of the first three bytes or a start or stop condition occurs unexpectedly), the read is considered invalid and the register is not affected. Multiple registers may be cleared in a multiple read cycle, each one being cleared as it is read. I²C reads from unused register addresses return all zeros.

Datasheet

Figure 8.4 illustrates a typical single and multiple register read.

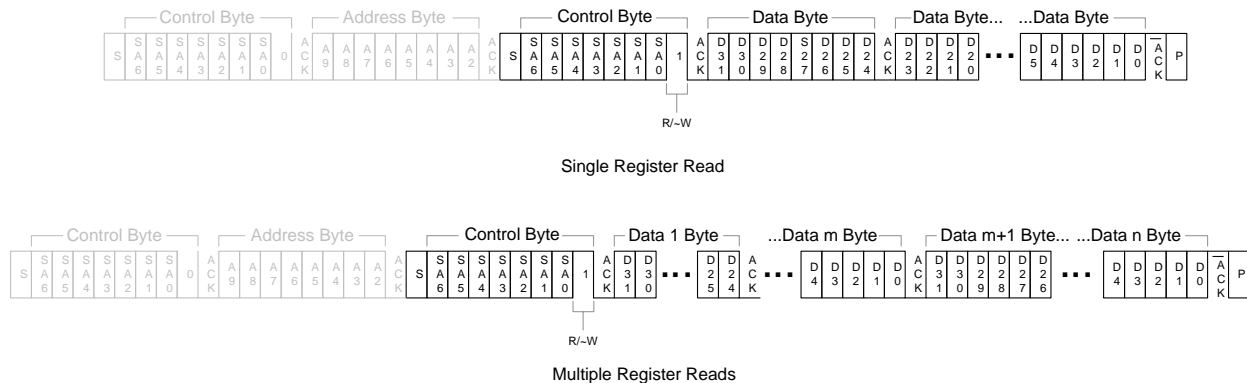

Figure 8.4 I²C Slave Reads

8.5.2.1 I²C Slave Read Polling for Reset Complete

During reset, the I²C slave interface will not return valid data. To determine when the reset condition is complete, the [Byte Order Test Register \(BYTE_TEST\)](#) should be polled. Once the correct pattern is read, the interface can be considered functional. At this point, the READY bit in the [Hardware Configuration Register \(HW_CFG\)](#) can be polled to determine when the device initialization is complete. Refer to [Section 4.2, "Resets," on page 41](#) for additional information.

8.5.3 I²C Slave Write Sequence

Following the device addressing, as detailed in [Section 8.5.1](#), a register is written to the LAN9313/LAN9313i when the master continues to send data bytes. Each byte is acknowledged by the LAN9313/LAN9313i. Following the fourth byte of the sequence, the master may either send another start condition or halt the sequence with a stop condition. The internal register address is unchanged following a single write.

Multiple writes are performed when the master sends additional bytes following the fourth acknowledge. The internal address is automatically incremented and the next register is written. Once the internal address reaches its maximum value, it rolls over to 0. The multiple write is concluded when the master sends another start condition or stop condition. The internal register address is incremented for each write including the final. This is not relevant for subsequent writes, since a new register address would be included on a new write cycle. However, this does affect the internal register address if it were to be used for reads without first resetting the register address.

For both single and multiple writes, if the master sends an unexpected start or stop condition, the LAN9313/LAN9313i will stop immediately and will respond to the next sequence as needed.

The data write to the register occurs after the 32-bits are input. In the event that 32-bits are not written (master sends a start, or a stop condition occurs unexpectedly), the write is considered invalid and the register is not affected. Multiple registers may be written in a multiple write cycle, each one being written after 32-bits. I²C writes must not be performed to unused register addresses.

Figure 8.5 illustrates a typical single and multiple register write.

Figure 8.5 I²C Slave Writes

Chapter 9 MII Management

9.1 Functional Overview

This chapter details the MII management functionality provided by the LAN9313/LAN9313i, which includes the [SMI Slave Controller](#), [PHY Management Interface \(PMI\)](#), and the [MII Mode Multiplexer](#). The [SMI Slave Controller](#) is used for CPU management of the LAN9313/LAN9313i via the MII pins, and allows CPU access to all system CSRs. The [PHY Management Interface \(PMI\)](#) is used to access the internal PHYs and optional external PHY, dependant on the management mode. The PMI implements the IEEE 802.3 management protocol. The [MII Mode Multiplexer](#) is used to direct the connections of the MII data path and MII management path based on the selected mode of the device.

9.2 SMI Slave Controller

The SMI slave controller uses the same pins and protocol as the IEEE 802.3 MII management function, and differs only in that SMI provides access to all internal registers by using a non-standard extended addressing map. The SMI protocol co-exists with the MII management protocol by using the upper half of the PHY address space (16 through 31). All direct and indirect registers of the LAN9313/LAN9313i can be accessed. The SMI management mode is selected when the `mngt_mode_strap[1:0]` inputs are set to 01b. A list of management modes and their configuration settings are discussed in [Section 2.3, "Modes of Operation,"](#) on page 23.

The MII management protocol is limited to 16-bit data accesses. The protocol is also limited to 5 PHY address bits and 5 register address bits. The SMI frame format can be seen in [Table 9.1](#). The LAN9313/LAN9313i uses the PHY Address field bits 3:0 as the system register address bits 9:6, and the Register Address field as the system register address bits 5:1. Therefore, Register Address field bit 0 is used as the upper/lower word select. The LAN9313/LAN9313i requires two back-to-back accesses to each register (with alternate settings of Register Address field bit 0) which are combined to form a 32-bit access. The access may be performed in any order.

Note: When accessing the LAN9313/LAN9313i, the pair of cycles must be atomic. In this case, the first host SMI cycle is performed to the low/high word and the second host SMI cycle is performed to the high/low word, forming a 32-bit transaction with no cycles to the LAN9313/LAN9313i in between. With the exception of Register Address field bit 0, all address and control bits must be the same for both 16-bit cycles of a 32-bit transaction.

Input data on the MDIO pin is sampled on the rising edge of the MDC input clock. Output data is sourced on the MDIO pin with the rising edge of the clock. The MDIO pin is three-stated unless actively driving read data.

A read or a write is performed using the frame format shown in [Table 9.1](#). All addresses and data are transferred msb first. Data bytes are transferred little endian. When Register Address bit 0 is 1, bytes 3 & 2 are selected with byte 3 occurring first. When Register Address bit 0 is 0, bytes 1 & 0 are selected with byte 1 occurring first.

Table 9.1 SMI Frame Format

	PREAMBLE	START	OP CODE	PHY ADDRESS Note 9.1	REGISTER ADDRESS Note 9.1	TURN-AROUND TIME Note 9.2	DATA	IDLE Note 9.3
READ	32 1's	01	10	1AAAA 9876	AAAAA 54321	Z0	DDDDDDDDDDDDDDDDDD 1111100000000000 5432109876543210	Z
WRITE	32 1's	01	01	1AAAA 9876	AAAAA 54321	10	DDDDDDDDDDDDDDDDDD 1111100000000000 5432109876543210	Z

Note 9.1 PHY Address bit 4 is 1 for SMI commands. PHY Address 3:0 form system register address bits 9:6. The Register Address field forms the system register address bits 5:1

Note 9.2 The turn-around time (TA) is used to avoid contention during a read cycle. For a read, the LAN9313/LAN9313i drives the second bit of the turn-around time to 0, and then drives the msb of the read data in the following clock cycle. For a write, the external host drives the first bit of the turn-around time to 1, the second bit of the turn-around time to 0, and then the msb of the write data in the following clock cycle.

Note 9.3 In the IDLE condition, the MDIO output is three-stated and pulled high externally.

Note: The SMI interface supports up to a 2.5MHz input clock. The MII/SMI timing adheres to the IEEE 802.3 specification. Refer to the IEEE 802.3 specification for detailed MII timing information.

9.2.1 Read Sequence

In a read sequence, the host sends the 32-bit preamble, 2-bit start of frame, 2-bit op-code, 5-bit PHY Address, and the 5-bit Register Address. The next clock is the first bit of the turnaround time in which the LAN9313/LAN9313i continues to three-state MDIO. On the next rising edge of MDC, the LAN9313/LAN9313i drives MDIO low. For the next 16 rising edges, the LAN9313/LAN9313i drives the output data. On the final clock, the LAN9313/LAN9313i once again three-states MDIO.

The host processor is required to perform two consecutive 16-bit reads to complete a single DWORD transfer. No ordering requirements exist. The processor can access either the low or high word first, as long as the next read is performed from the other word. If a read to the same word is performed, the combined data read pair is invalid and should be re-read. This is not a fatal error. The LAN9313/LAN9313i will simply reset the read counters, and restart a new cycle on the next read.

Note: Select registers are readable as 16-bit registers, as noted in their register descriptions. For these registers, only one 16-bit read may be performed without the need to read the other word.

Register values are latched (registered) at the beginning of each 16-bit read to prevent the host from reading an intermediate value. In addition, any register that is affected by a read operation, such as a clear on read bit, is not cleared until after the end of the second read. In the event that 32-bits are not read, the read is considered invalid and the register is not affected.

Any register that may change between two consecutive host read cycles and spans across two WORDs, such as a counter, is latched (registered) at the beginning of the first read and held until after the second read has completed. This prevents the host from reading inconsistent data from the first and second half of a register. For example, if a counters value is 01FFh, the first half will be read as 01h. If the counter then changes to 0200h, the host would read 00h, resulting an the incorrect value of 0100h instead of either 01FFh or 0200h.

Note: SMI reads from unused register addresses return all zeros. This differs from unused PHY registers which leave MDIO un-driven.

9.2.1.1 SMI Read Polling for Reset Complete

During reset, the SMI slave interface will not return valid data. To determine when the reset condition is complete, the [Byte Order Test Register \(BYTE_TEST\)](#) should be polled. Once the correct pattern is read, the interface can be considered functional. At this point, the READY bit in the [Hardware Configuration Register \(HW_CFG\)](#) can be polled to determine when the device initialization is complete. Refer to [Section 4.2, "Resets," on page 41](#) for additional information.

Note: In the event that a reset condition terminates between halves of 16-bit read pair, the LAN9313/LAN9313i will not expect another 16-bit read to complete the DWORD cycle. Only specific registers may be read during a reset. Refer to [Section 4.2, "Resets," on page 41](#) for additional information.

Datasheet

9.2.2 Write Sequence

In a write sequence, the host sends the 32-bit preamble, 2-bit start of frame, 2-bit op-code, 5-bit PHY Address, 5-bit Register Address, 2-bit turn-around time, and finally the 16-bits of data. The MDIO pin is three-stated throughout the write sequence.

The host processor is required to perform two contiguous 16-bit writes to complete a single DWORD transfer. No ordering requirement exists. The host may access either the low or high word first, as long as the next write is performed to the opposite word. If a write to the same word is performed, the device disregards the transfer.

Note: SMI writes must not be performed to unused register addresses.

9.3 PHY Management Interface (PMI)

The PHY Management Interface (PMI) is used to access the internal PHYs as well as the external PHY on the MII pins (in MAC modes only). The PMI operates at 2.5MHz, and implements the IEEE 802.3 management protocol, providing read/write commands for PHY configuration.

A read or write is performed using the frame format shown in [Table 9.2](#). All addresses and data are transferred msb first. Data bytes are transferred little endian.

Table 9.2 MII Management Frame Format

	PREAMBLE	START	OP CODE	PHY ADDRESS	REGISTER ADDRESS	TURN-AROUND TIME Note 9.4	DATA	IDLE Note 9.5
READ	32 1's	01	10	AAAAA	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
WRITE	32 1's	01	01	AAAAA	RRRRR	10	DDDDDDDDDDDDDDDD	Z

Note 9.4 The turn-around time (TA) is used to avoid bus contention during a read cycle. For a read, the external PHY drives the second bit of the turn-around time to 0, and then drives the msb of the read data in the following cycle. For a write, the LAN9313/LAN9313i drives the first bit of the turnaround time to 1, the second bit of the turnaround time to 0, and then the msb of the write data in the following clock cycle.

Note 9.5 In the IDLE condition, the MDIO output is three-stated and pulled high externally.

The internal PHYs and optional external PHY (in MAC modes) are accessed via the [PHY Management Interface Access Register \(PMI_ACCESS\)](#) and [PHY Management Interface Data Register \(PMI_DATA\)](#). These registers allow read and write operations to all PHY registers. Refer to [Section 13.1.6, "PHY Management Interface \(PMI\)," on page 207](#) for detailed information on these registers.

9.3.1 EEPROM Loader PHY Register Access

The PMI is also used by the EEPROM Loader to load the PHY registers with various configuration strap values. The [PHY Management Interface Access Register \(PMI_ACCESS\)](#) and [PHY Management Interface Data Register \(PMI_DATA\)](#) are also accessible as part of the Register Data burst sequence of the EEPROM Loader. Refer to [Section 8.2.4, "EEPROM Loader," on page 113](#) for additional information.

9.4 MII Mode Multiplexer

The MII mode multiplexer is used to direct the MII data/management path connections. One master (MAC via the MII pins, or PMI) is connected to the slaves (PHY via MII pins, Port 1/2 PHYs, Virtual PHY, and SMI slave) dependant on the selected management mode of the LAN9313/LAN9313i. The MII mode multiplexer also performs the multiplexing of the read data signals from the slaves and controls the output enable of the MII pins.

The following sections detail the operation of the MII mode multiplexer in each management mode. A list of management modes and their configuration settings are discussed in [Section 2.3, "Modes of Operation,"](#) on page 23.

9.4.1 MAC Mode Unmanaged

In MAC mode unmanaged, no external accesses to the LAN9313/LAN9313i are required. The MII multiplexer is disabled and the MII management pins are not driven.

The Virtual PHY interface is accessible via the EEPROM Loader. Refer to [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for additional information.

[Figure 9.1](#) details the MII multiplexer management path connections for this mode.

Figure 9.1 MII Mux Management Path Connections - MAC Mode Unmanaged

Datasheet

9.4.2 MAC Mode SMI Managed

In MAC mode SMI managed, the internal PHYs and SMI slave block are accessed via the MII management pins. The Virtual PHY and PMI are not used in this mode.

The Virtual PHY interface is accessible via the SMI slave or the EEPROM Loader. Refer to [Section 9.2, "SMI Slave Controller,"](#) on page 125 and [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for additional information.

Figure 9.2 details the MII multiplexer management path connections for this mode.

Figure 9.2 MII Mux Management Path Connections - MAC Mode SMI Managed

9.4.3 MAC Mode I²C/SPI Managed

In MAC mode I²C or SPI managed, the internal PHYs and the external PHY are accessed via the PMI. The SMI slave and the Virtual PHY are not used in these modes.

The Virtual PHY and PMI interfaces are accessible via the I²C/SPI slave interfaces or the EEPROM Loader. Refer to [Section 8.3, "SPI/I2C Slave Controller,"](#) on page 118 and [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for additional information.

Figure 9.3 details the MII multiplexer management path connections for this mode.

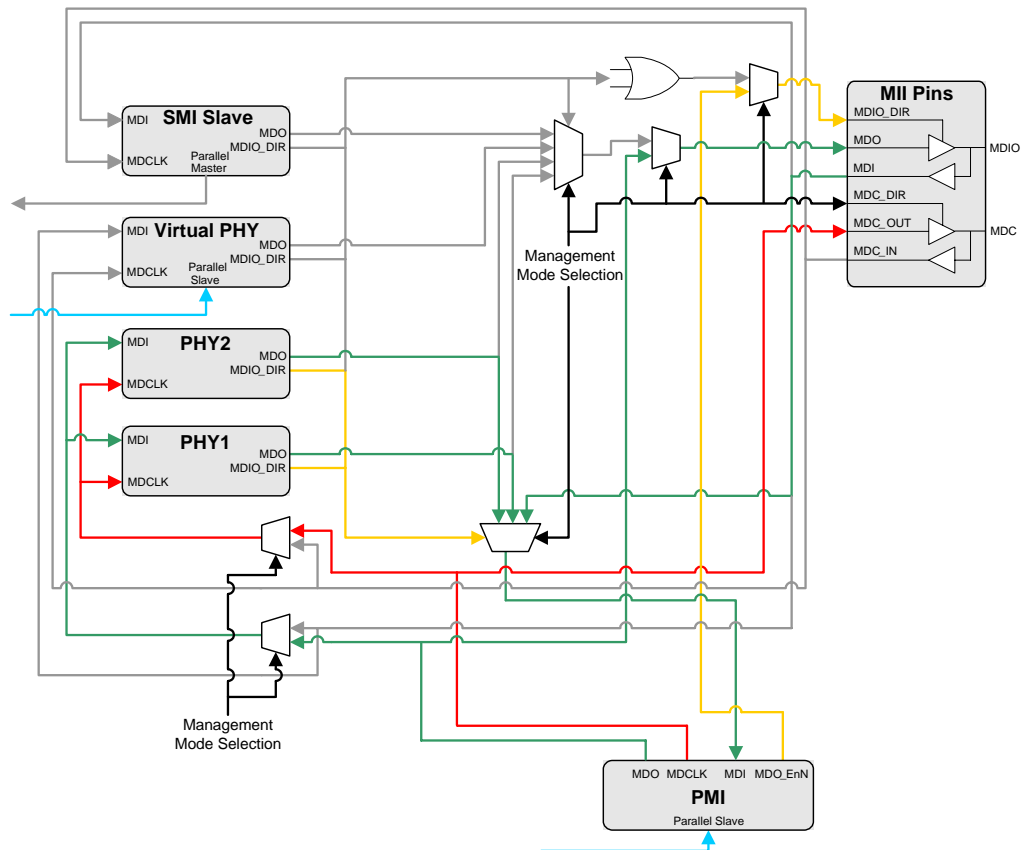

Figure 9.3 MII Mux Management Path Connections - MAC Mode I²C/SPI Managed

Datasheet

9.4.4 PHY Mode Unmanaged

In PHY mode unmanaged, the Virtual PHY is accessed via the external MII management pins. The Port 1/2 PHYs, SMI slave, and the PMI are not used in this mode.

The Virtual PHY interface is accessible via the EEPROM Loader. Refer to [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for additional information.

Figure 9.4 details the MII multiplexer management path connections for this mode.

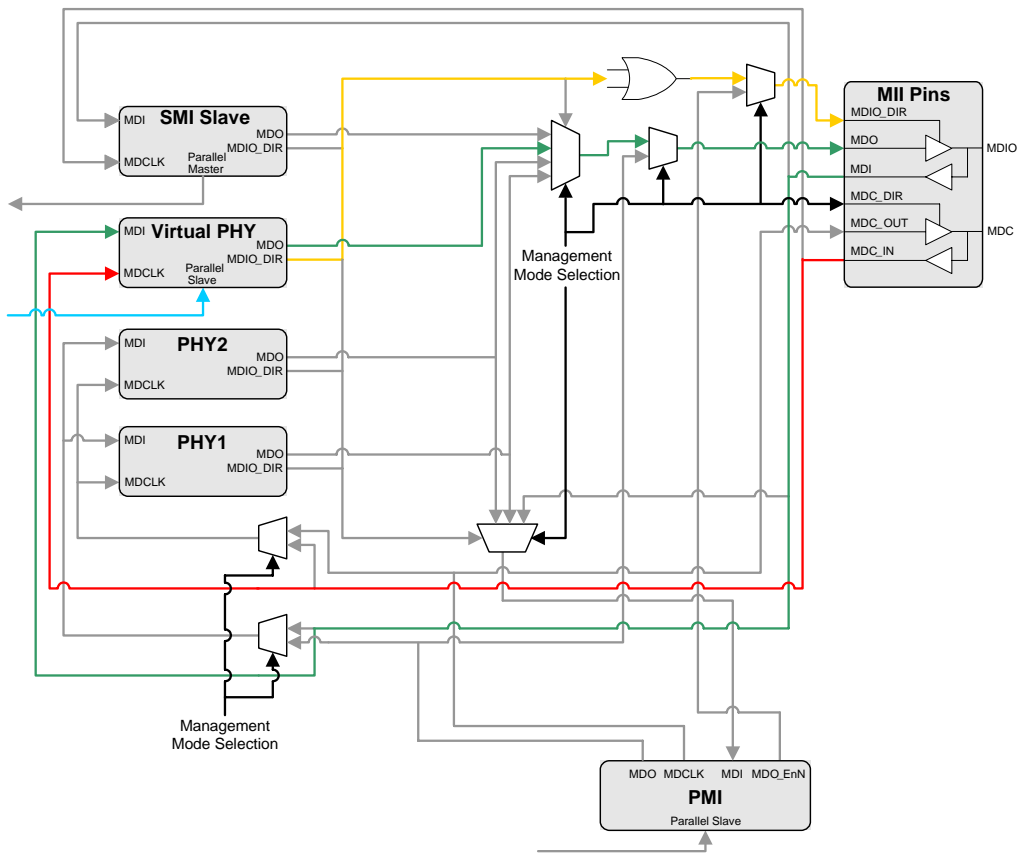

Figure 9.4 MII Mux Management Path Connections - PHY Mode Unmanaged

9.4.5 PHY Mode SMI Managed

In PHY mode SMI managed, the internal PHYs, Virtual PHY, and SMI slave block are accessed via the MII management pins. The PMI is not used in this mode.

The Virtual PHY interface is accessible via the SMI slave or the EEPROM Loader. Refer to [Section 9.2, "SMI Slave Controller,"](#) on page 125 and [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for additional information.

Figure 9.2 details the MII multiplexer management path connections for this mode.

Figure 9.5 MII Mux Management Path Connections - PHY Mode SMI Managed

Datasheet

9.4.6 PHY Mode I²C/SPI Managed

In PHY mode I²C or SPI managed, the Port 1/2 PHYs are accessed via the PMI, and the Virtual PHY is accessed via the external MII management pins. The SMI slave is not used in these modes.

The Virtual PHY and PMI parallel interfaces are accessible via the I²C/SPI slave interfaces or the EEPROM Loader. Refer to Section 8.3, "SPI/I²C Slave Controller," on page 118 and Section 8.2.4, "EEPROM Loader," on page 113 for additional information.

Figure 9.3 details the MII multiplexer management path connections for this mode.

Chapter 10 IEEE 1588 Hardware Time Stamp Unit

10.1 Functional Overview

The LAN9313/LAN9313i provides hardware support for the IEEE 1588 Precision Time Protocol (PTP), allowing clock synchronization with remote Ethernet devices, packet time stamping, and time driven event generation. Time stamping is supported on all ports, with an individual IEEE 1588 Time Stamp module connected to each port via the MII bus. Any port may function as a master or a slave clock per the IEEE 1588 specification, and the LAN9313/LAN9313i as a whole may function as a boundary clock.

A 64-bit tunable clock is provided that is used as the time source for all IEEE 1588 time stamp related functions. An IEEE 1588 Clock/Events block provides IEEE 1588 clock comparison based interrupt generation and time stamp related GPIO event generation. Two LAN9313/LAN9313i GPIO pins (GPIO[8:9]) can be used to trigger a time stamp capture when configured as an input, or output a signal from the GPIO based on an IEEE 1588 clock target compare event when configured as an output. [Section 10.1.2, "Block Diagram"](#) describes the various IEEE 1588 related blocks and how they interface to other LAN9313/LAN9313i functions.

All features of the IEEE 1588 hardware time stamp unit can be monitored and configured via their respective configuration and status registers. A detailed description of all IEEE 1588 CSRs is included in [Section 13.1.4, "IEEE 1588," on page 164](#).

10.1.1 IEEE 1588

IEEE 1588 specifies a Precision Time Protocol (PTP) used by master and slave clock devices to pass time information in order to achieve clock synchronization. Five network message types are defined:

- Sync
- Delay_Req
- Follow_Up
- Delay_Resp
- Management

Only the first four message types (Sync, Delay_Req, Follow_Up, Delay_Resp) are used for clock synchronization. Using these messages, the protocol software may calculate the offset and network delay between time stamps, adjusting the slave clock frequency as needed. Refer to the IEEE 1588 protocol for message definitions and proper usage.

A PTP domain is segmented into PTP sub-domains, which are then segmented into PTP communication paths. Within each PTP communication path there is a maximum of one master clock, which is the source of time for each slave clock. The determination of which clock is the master and which clock(s) is(are) the slave(s) is not fixed, but determined by the IEEE 1588 protocol. Similarly, each PTP sub-domain may have only one master clock, referred to as the Grand Master Clock.

PTP communication paths are conceptually equivalent to Ethernet collision domains and may contain devices which extend the network. However, unlike Ethernet collision domains, the PTP communication path does not stop at a network switch, bridge, or router. This leads to a loss of precision when the network switch/bridge/router introduces a variable delay. Boundary clocks are defined which conceptually bypass the switch/bridge/router (either physically or via device integration). Essentially, a boundary clock acts as a slave to an upstream master, and as a master to a down stream slave. A boundary clock may contain multiple ports, but a maximum of one slave port is permitted.

For more information on the IEEE 1588 protocol, refer to the National Institute of Standards and Technology IEEE 1588 website:

<http://ieee1588.nist.gov/>

Datasheet

10.1.2 Block Diagram

The LAN9313/LAN9313i IEEE 1588 implementation is illustrated in Figure 10.1, and consists of the following major function blocks:

- **IEEE 1588 Time Stamp**
These three identical blocks provide time stamping functions on all switch fabric ports.
- **IEEE 1588 Clock**
This block provides a 64-bit tunable clock that is used as the time source for all IEEE 1588 time stamp related functions.
- **IEEE 1588 Clock/Events**
This block provides IEEE 1588 clock comparison-based interrupt generation and time stamp related GPIO event generation.

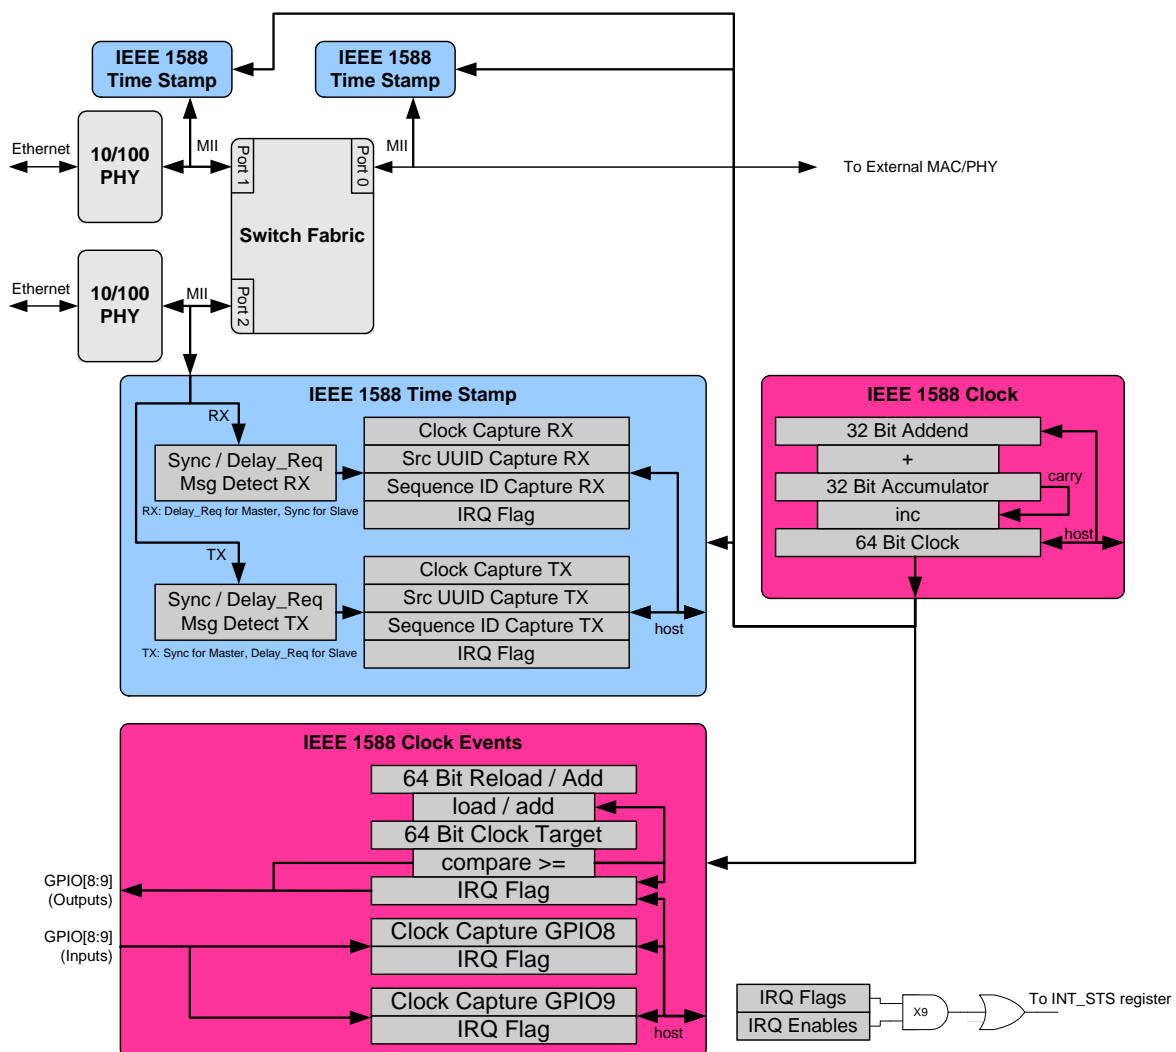

Figure 10.1 IEEE 1588 Block Diagram

10.2 IEEE 1588 Time Stamp

The LAN9313/LAN9313i contains three identical IEEE 1588 Time Stamp blocks as shown in [Figure 10.1](#). These blocks are responsible for capturing the source UUID, sequence ID, and current 64-bit IEEE 1588 clock time upon detection of a Sync or Delay_Req message type on their respective port. The mode of the clock (master or slave) determines which message is detected on receive and transmit. For slave clock operation, Sync messages are detected on receive and Delay_Req messages on transmit. For master clock operation, Delay_Req messages are detected on receive and Sync messages on transmit. Follow_Up, Delay_Resp and Management packet types do not cause capture. Each port may be individually configured as an IEEE 1588 master or slave clock via the master/slave bits (M_nS_1 for Port 1, M_nS_2 for Port2, and M_nS_MII for Port 0) in the [1588 Configuration Register \(1588_CONFIG\)](#). [Table 10.1](#) summarizes the message type detection under slave and master IEEE 1588 clock operation.

Table 10.1 IEEE 1588 Message Type Detection

IEEE 1588 CLOCK MODE	RECEIVE	TRANSMIT
Slave (M_nS_x = 0)	Sync	Delay_Req
Master (M_nS_x = 1)	Delay_Req	Sync

For ports 1 and 2, receive is defined as data *from* the PHY (from the outside world) and transmit is defined as data *to* the PHY. This is consistent with the point-of-view of where the partner clock resides (LAN9313/LAN9313i receives packets from the partner via the PHY, etc.). For the time stamp module connected to the external MII port (Port 0), the definition of transmit and receive is reversed. Receive is defined as data *from* the switch fabric, while transmit is defined as data *to* the switch fabric. This is consistent with the point-of-view of where the partner clock resides (LAN9313/LAN9313i receives packets from the partner via the switch fabric, etc.).

As defined by IEEE 1588, and shown in [Figure 10.2](#), the message time stamp point is defined as the leading edge of the first data bit following the Start of Frame Delimiter (SFD). However, since the packet contents are not yet known, the time stamp can not yet be loaded into the capture register. Therefore, the time stamp is first stored into a temporary internal holding register at the start of every packet.

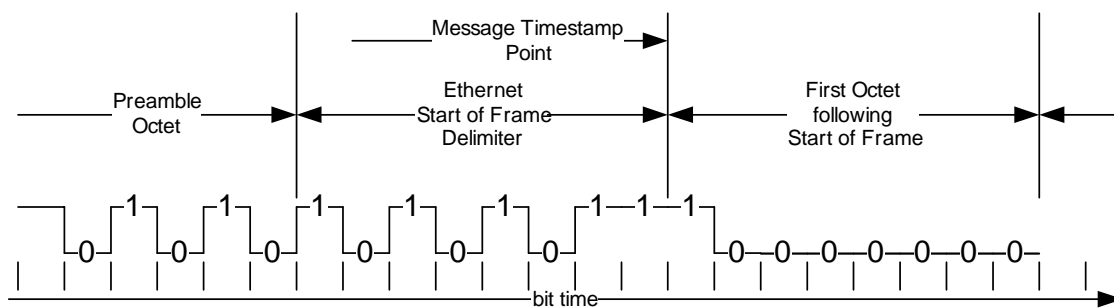

Figure 10.2 IEEE 1588 Message Time Stamp Point

Datasheet

Clock synchronization and hardware processing between the network data and the time stamp capture hardware causes the time stamp point to be slightly delayed. The host software can account for this delay, as it is fairly deterministic. [Table 10.2](#) details the time stamp capture delay as a function of the mode of operation. Refer to [Chapter 7, "Ethernet PHYs," on page 84](#) for details on these modes.

Table 10.2 Time Stamp Capture Delay

MODE OF OPERATION	DELAY (+/- 10 nS)
100 Mbps	30 nS
10 Mbps	120 nS

Once the packet type is matched, according to [Table 10.1](#), and the Frame Check Sequence (FCS) is verified, the following occurs:

- The time stamp is loaded into the corresponding ports' capture registers:
 - On Reception: [Port x 1588 Clock High-DWORD Receive Capture Register \(1588_CLOCK_HI_RX_CAPTURE_x\)](#) and [Port x 1588 Clock Low-DWORD Receive Capture Register \(1588_CLOCK_LO_RX_CAPTURE_x\)](#)
 - On Transmission: [Port x 1588 Clock High-DWORD Transmit Capture Register \(1588_CLOCK_HI_TX_CAPTURE_x\)](#) and [Port x 1588 Clock Low-DWORD Transmit Capture Register \(1588_CLOCK_LO_TX_CAPTURE_x\)](#)
- The Sequence ID and Source UUID are loaded into the corresponding ports' registers:
 - On Reception: [Port x 1588 Sequence ID, Source UUID High-WORD Receive Capture Register \(1588_SEQ_ID_SRC_UUID_HI_RX_CAPTURE_x\)](#) and [Port x 1588 Source UUID Low-DWORD Receive Capture Register \(1588_SRC_UUID_LO_RX_CAPTURE_x\)](#)
 - On Transmission: [Port x 1588 Sequence ID, Source UUID High-WORD Transmit Capture Register \(1588_SEQ_ID_SRC_UUID_HI_TX_CAPTURE_x\)](#) and [Port x 1588 Source UUID Low-DWORD Transmit Capture Register \(1588_SRC_UUID_LO_TX_CAPTURE_x\)](#)
- The corresponding maskable interrupt flag is set in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#). (Refer to [Section 10.6, "IEEE 1588 Interrupts," on page 140](#) for information on IEEE 1588 interrupts.)

Note: Packets that do not contain an integral number of octets are not considered valid and do not cause a capture.

10.2.1 Capture Locking

The corresponding ports' clock capture, sequence ID, and source UUID registers can be optionally locked when a capture event occurs, preventing them from being overwritten until the host clears the corresponding interrupt flag in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#).

This is accomplished by setting the corresponding lock enable bit(s) in the [1588 Configuration Register \(1588_CONFIG\)](#). Each port has two lock enable control bits within this register, which allow the receive and transmit portions of each port to be locked independently. In addition, a lock enable bit is provided for each time stamp enabled GPIO ([LOCK_ENABLE_GPIO_8](#) and [LOCK_ENABLE_GPIO_9](#)) which prevents the corresponding GPIO clock capture registers from being overwritten when the GPIO interrupt in [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) is set. Refer to [Section 13.1.4.22, "1588 Configuration Register \(1588_CONFIG\)," on page 185](#) for additional information on the capture locking related bits.

10.2.2 PTP Message Detection

In order to provide the most flexibility, loose packet type matching is used by the LAN9313/LAN9313i. This assumes that for all packets received with a valid FCS, only the MAC destination address is required to qualify them as a PTP message. For Ethernet, four multicast addresses are specified in the PTP protocol: 224.0.1.129 through 224.0.1.132. These map to Ethernet MAC addresses 01:00:5e:00:01:81 through 01:00:5e:00:01:84. Each of these addresses has one enable bit per port in the [1588 Configuration Register \(1588_CONFIG\)](#) which enables/disables the corresponding address as a PTP address on the specified port.

In addition to the fixed addresses, a user defined (host programmable) PTP address may be input via the [1588 Auxiliary MAC Address High-WORD Register \(1588_AUX_MAC_HI\)](#) and [1588 Auxiliary MAC Address Low-DWORD Register \(1588_AUX_MAC_LO\)](#). The user defined address may be disabled/enabled as a PTP address on each port via the dedicated enable bits in the [1588 Configuration Register \(1588_CONFIG\)](#). A summary of the supported PTP multicast addresses and corresponding enable bits can be seen in [Table 10.3](#).

Table 10.3 PTP Multicast Addresses

PTP ADDRESS	CORRESPONDING MAC ADDRESS	RELATED ENABLE BITS IN THE 1588_CONFIG REGISTER
224.0.1.129 (Primary)	01:00:5e:00:01:81	MAC_PRI_EN_1 (Port 1) MAC_PRI_EN_2 (Port 2) MAC_PRI_EN_MII (Port 0)
224.0.1.130 (Alternate 1)	01:00:5e:00:01:82	MAC_ALT1_EN_1 (Port 1) MAC_ALT1_EN_2 (Port 2) MAC_ALT1_EN_MII (Port 0)
224.0.1.131 (Alternate 2)	01:00:5e:00:01:83	MAC_ALT2_EN_1 (Port 1) MAC_ALT2_EN_2 (Port 2) MAC_ALT2_EN_MII (Port 0)
224.0.1.132 (Alternate 3)	01:00:5e:00:01:84	MAC_ALT3_EN_1 (Port 1) MAC_ALT3_EN_2 (Port 2) MAC_ALT3_EN_MII (Port 0)
User Defined	User Defined Address (1588_AUX_MAC_HI & 1588_AUX_MAC_LO registers)	MAC_USER_EN_1 (Port 1) MAC_USER_EN_2 (Port 2) MAC_USER_EN_MII (Port 0)

Once a packet is determined to match a PTP destination address, it is further qualified as a Sync or Delay_Req message type. On Ethernet, PTP uses UDP messages. Within the UDP payload is the PTP control byte (offset 32 starting at 0). This byte determines the message type: 0x00 for a Sync message, 0x01 for a Delay_Req message. The UDP payload starts at packet byte offset 42 (from 0) for untagged packets and at byte offset 46 for tagged packets.

Note: Both tagged and untagged packets are supported. Only Ethernet II packet encoding and IPv4 are supported.

Note: For proper routing of the PTP packets, the host must program an entry into the switch engine Address Logic Resolution (ALR) Table. The MAC address should be one of the reserved Multicast addresses in [Table 10.3](#), with Port 0(External MII) as a destination. The Static and Valid bits must also be set. Refer to [Chapter 6, "Switch Fabric," on page 57](#) for more information.

10.3 IEEE 1588 Clock

The 64-bit IEEE 1588 clock is the time source for all IEEE 1588 related functions of the LAN9313/LAN9313i. It is readable and writable by the host via the [1588 Clock High-DWORD Register \(1588_CLOCK_HI\)](#) and [1588 Clock Low-DWORD Register \(1588_CLOCK_LO\)](#).

In order to accurately read this clock, a special procedure must be followed. Since two DWORD reads are required to fully read the 64-bit clock, the possibility exists that as the lower 32-bits roll over, a wrong intermediate value could be read. To prevent this, a snapshot register technique is used. When the 1588_CLOCK_SNAPSHOT bit in the [1588 Command Register \(1588_CMD\)](#) register is written with "1", the current value of the 1588 clock is saved, allowing it to be properly read.

When writing a new value to the IEEE 1588 clock, two 32-bit write cycles are required (one for each clock register) before the registers are affected. The writes may be in any order. However, caution must be observed when changing the clock value in a live environment as it will disrupt linear time. If the clock must be adjusted during operation of the 1588 protocol, it is preferred to adjust the Addend value, effectively speeding-up or slowing-down the clock until the correct time is achieved.

The 64-bit IEEE 1588 clock consists of the 32-bit [1588 Clock Addend Register \(1588_CLOCK_ADDEND\)](#) that is added to a 32-bit Accumulator every 100 MHz clock. Upon overflow of the Accumulator, the 64-bit IEEE 1588 clock is incremented. The Addend / Accumulator pair form a high precision frequency divider which can be used to compensate for the inaccuracy of the reference crystal. The nominal frequency of the 64-bit IEEE 1588 clock and the value of the Addend are calculated as follows:

$$\text{FreqClock} = (\text{Addend} / 2^{32}) * 100 \text{ MHz}$$

$$\text{Addend} = (\text{FreqClock} * 2^{32}) / 100 \text{ MHz}$$

Typical values for the Addend are shown in [Table 10.4](#). These values should be adjusted based on the accuracy of the IEEE 1588 clock compared to the master clock per the PTP protocol. The adjustment precision column of the table shows the percentage change for the specified IEEE 1588 clock frequency if the Addend was to be incremented or decremented by 1.

Table 10.4 Typical IEEE 1588 Clock Addend Values

IEEE 1588 CLOCK (FreqClock)	1588_CLOCK_ADDEND (Addend)	ADJUSTMENT PRECISION %
33 MHz	547AE147h	7.1*10 ⁻⁸
50 MHz	80000000h	4.7*10 ⁻⁸
66 MHz	A8F5C28Fh	3.5*10 ⁻⁸
75 MHz	C0000000h	3.1*10 ⁻⁸
90 MHz	E6666666h	2.6*10 ⁻⁸

10.4 IEEE 1588 Clock/Events

The IEEE 1588 Clock/Events block is responsible for generating and controlling all IEEE 1588 clock related events. A 64-bit comparator is included in this block which compares the 64-bit IEEE 1588 clock with a 64-bit Clock Target loaded in the [1588 Clock Target High-DWORD Register \(1588_CLOCK_TARGET_HI\)](#) and [1588 Clock Target Low-DWORD Register \(1588_CLOCK_TARGET_LO\)](#).

When the IEEE 1588 clock equals the Clock Target, a clock event occurs which triggers the following:

- The maskable interrupt 1588_TIMER_INT is set in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#).
- The RELOAD_ADD bit in the [1588 Configuration Register \(1588_CONFIG\)](#) is checked to determine the new Clock Target behavior:
 - RELOAD_ADD = 1:
The new Clock Target is loaded from the 64-bit Reload / Add Registers ([1588 Clock Target Reload High-DWORD Register \(1588_CLOCK_TARGET_RELOAD_HI\)](#) and [1588 Clock Target Reload/Add Low-DWORD Register \(1588_CLOCK_TARGET_RELOAD_LO\)](#)).
 - RELOAD_ADD = 0:
The Clock Target is incremented by the [1588 Clock Target Reload/Add Low-DWORD Register \(1588_CLOCK_TARGET_RELOAD_LO\)](#).

Note: Writing the IEEE 1588 clock may cause the interrupt event to occur if the new IEEE 1588 clock value is set equal to the current Clock Target.

The Clock Target reload function (RELOAD_ADD = 1) allows the host to pre-load the next trigger time. The add function (RELOAD_ADD = 0), allows for a repeatable event. When the Clock Target overflows, it will wrap around past 0, as will the 64-bit IEEE 1588 clock. Since the Clock Target and Reload / Add Registers are 64-bits, they require two 32-bit write cycles, one to each half, before the registers are affected. The writes may be in any order.

10.5 IEEE 1588 GPIOs

In addition to time stamping PTP packets, the IEEE 1588 clock value can be saved into a set of clock capture registers based on the GPIO[9:8] inputs. When configured as outputs, GPIO[9:8] can be used to output a signal based on an IEEE 1588 clock target compare event. Refer to [Section 12.2.1, "GPIO IEEE 1588 Timestamping," on page 143](#) for information on using GPIO[9:8] for IEEE 1588 time stamping functions.

10.6 IEEE 1588 Interrupts

The IEEE 1588 hardware time stamp unit provides multiple interrupt conditions. These include time stamp indication on the transmitter and receiver side of each port, individual GPIO[9:8] input time stamp interrupts, and a clock comparison event interrupt. All IEEE 1588 interrupts are located in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) and are fully maskable via their respective enable bits. Refer to [Section 13.1.4.23, "1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)," on page 189](#) for bit-level definitions of all IEEE 1588 interrupts and enables.

All IEEE 1588 interrupts are ANDed with their individual enables and then ORed, as shown in [Figure 10.1](#), generating the 1588_EVNT bit of the [Interrupt Status Register \(INT_STS\)](#).

When configured as an input, GPIO[9:8] have the added functionality of clearing the Clock Target interrupt bit (1588_TIMER_INT) of the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) on an active edge. GPIO inputs must be active for greater than 40 nS to be recognized as clear events. For more information on IEEE 1588 GPIO interrupts, refer to [Section 12.2.2, "GPIO Interrupts," on page 143](#).

Refer to [Chapter 5, "System Interrupts," on page 52](#) for additional information on the LAN9313/LAN9313i interrupts.

Chapter 11 General Purpose Timer & Free-Running Clock

This chapter details the LAN9313/LAN9313i General Purpose Timer (GPT) and the Free-Running Clock.

11.1 General Purpose Timer

The LAN9313/LAN9313i provides a 16-bit programmable General Purpose Timer that can be used to generate periodic system interrupts. The resolution of this timer is 100uS.

The GPT loads the [General Purpose Timer Count Register \(GPT_CNT\)](#) with the value in the GPT_LOAD field of the [General Purpose Timer Configuration Register \(GPT_CFG\)](#) when the TIMER_EN bit of the [General Purpose Timer Configuration Register \(GPT_CFG\)](#) is asserted (1). On a chip-level reset, or when the TIMER_EN bit changes from asserted (1) to de-asserted (0), the GPT_LOAD field is initialized to FFFFh. The [General Purpose Timer Count Register \(GPT_CNT\)](#) is also initialized to FFFFh on reset. Software can write a pre-load value into the GPT_LOAD field at any time (e.g. before or after the TIMER_EN bit is asserted).

Once enabled, the GPT counts down until it reaches 0000h, or until a new pre-load value is written to the GPT_LOAD field. At 0000h, the counter wraps around to FFFFh, asserts the GPT interrupt status bit (GPT_INT) in the [Interrupt Status Register \(INT_STS\)](#), asserts the IRQ interrupt (if GPT_INT_EN is set in the [Interrupt Status Register \(INT_STS\)](#)), and continues counting. GPT_INT is a sticky bit. Once this bit is asserted, it can only be cleared by writing a 1 to the bit. Refer to [Section 5.2.5, "General Purpose Timer Interrupt," on page 55](#) for additional information on the GPT interrupt.

11.2 Free-Running Clock

The Free-Running Clock (FRC) is a simple 32-bit up-counter that operates from a fixed 25MHz clock. The current FRC value can be read via the [Free Running 25MHz Counter Register \(FREE_RUN\)](#). On assertion of a chip-level reset, this counter is cleared to zero. On de-assertion of a reset, the counter is incremented once for every 25MHz clock cycle. When the maximum count has been reached, the counter rolls over to zeros. The FRC does not generate interrupts.

Note: The free running counter can take up to 160nS to clear after a reset event.

Chapter 12 GPIO/LED Controller

12.1 Functional Overview

The GPIO/LED Controller provides 12 configurable general purpose input/output pins, GPIO[11:0]. These pins can be individually configured to function as inputs, push-pull outputs, or open drain outputs and each is capable of interrupt generation with configurable polarity. Two of the GPIO pins (GPIO[9:8]) can be used for IEEE 1588 timestamp functions, allowing GPIO driven 1588 time clock capture when configured as an input, or GPIO output generation based on an IEEE 1588 clock target compare event.

In addition, 8 of the GPIO pins can be alternatively configured as LED outputs. These pins, GPIO[7:0] (nP1LED[3:0] and nP2LED[3:0]), may be enabled to drive Ethernet status LEDs for external indication of various attributes of the switch ports.

GPIO and LED functionality is configured via the GPIO/LED System Control and Status Registers (CSRs), accessible through the I²C/SPI serial interfaces or the MII/SMI interfaces. These registers are defined in [Section 13.1.2, "GPIO/LED," on page 155](#).

12.2 GPIO Operation

The GPIO controller is comprised of 12 programmable input/output pins. These pins are individually configurable via the GPIO CSRs. On application of a chip-level reset:

- All GPIOs are set as inputs (GPDIR[11:0] cleared in [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#))
- All GPIO interrupts are disabled (GPIO[11:0]_INT_EN cleared in [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#))
- All GPIO interrupts are configured to low logic level triggering (GPIO_INT_POL[11:0] cleared in [General Purpose I/O Configuration Register \(GPIO_CFG\)](#))

Note: GPIO[7:0] may be configured as LED outputs by default, dependant on the LED_en_stap[7:0] configuration straps. Refer to [Section 12.3, "LED Operation"](#) for additional information.

The direction and buffer type of all 12 GPIOs are configured via the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#) and [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#). The direction of each GPIO, input or output, should be configured first via its respective GPIO direction bit (GPDIR[11:0]) in the [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#). When configured as an output, the output buffer type for each GPIO is selected by the GPIOBUF[11:0] bits in the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#). Push/pull and open-drain output buffers are supported for each GPIO. When functioning as an open-drain driver, the GPIO output pin is driven low when the corresponding data register bit (GPIOD in the [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#)) is cleared to 0, and is not driven when set to 1.

When a GPIO is enabled as an output, the value output to the GPIO pin is set via the corresponding GPIOD[11:0] bit in the [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#). For GPIOs configured as inputs, the corresponding GPIOD[11:0] bit reflects the current state of the GPIO input.

Note: For GPIO[9:8], the pin direction is a function of both the GPDIR[9:8] bits of the [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#) and the 1588_GPIO_OE[9:8] bits in the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#).

Datasheet

12.2.1 GPIO IEEE 1588 Timestamping

Two of the GPIO pins, GPIO[9:8], have the option to be used for IEEE 1588 time stamp functions. This allows a time stamp capture to be triggered when the GPIO is configured as an input, or output a signal from the GPIO based on an IEEE 1588 clock target compare event when configured as an output. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for additional information on the IEEE 1588 time stamping functions of the LAN9313/LAN9313i.

12.2.1.1 IEEE 1588 GPIO Inputs

When the GPIO[9:8] pins are configured as inputs, an active edge will capture the IEEE 1588 clock into the high and low 1588 capture registers (1588_CLOCK_HI_CAPTURE_GPIO_x, and 1588_CLOCK_LO_CAPTURE_GPIO_x where "x" represents the number of the respective 1588 enabled GPIO) and set the corresponding interrupt flags GPIO[9:8]_INT and 1588_GPIO[9:8]_INT in the [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#) and [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) respectively. The GPIO[9:8] inputs can also be configured to clear the Clock Target interrupt (1588_TIMER_INT) in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) by setting the corresponding GPIO_1588_TIMER_INT_CLEAR_EN[9:8] bit in the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#). GPIO inputs must be active for greater than 40nS to be recognized as capture or interrupt clear events.

12.2.1.2 IEEE 1588 GPIO Outputs

The GPIO[9:8] pins can be configured as IEEE 1588 enabled outputs by setting the corresponding 1588_GPIO_OE[9:8] bits in the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#). These bits override the GPDIR[9:8] bits of the [General Purpose I/O Data & Direction Register \(GPIO_DATA_DIR\)](#) and allow for GPIO output generation based on the IEEE 1588 clock target compare event. Clock target compare events occur when the value loaded into the [1588 Clock Target High-DWORD Register \(1588_CLOCK_TARGET_HI\)](#) and [1588 Clock Target Low-DWORD Register \(1588_CLOCK_TARGET_LO\)](#) matches the current IEEE 1588 clock value in the [1588 Clock High-DWORD Register \(1588_CLOCK_HI\)](#) and [1588 Clock Low-DWORD Register \(1588_CLOCK_LO\)](#).

Upon detection of a clock target compare event, GPIO[9:8] can be configured to output a 100nS pulse, toggle its output, or reflect the 1588_TIMER_INT bit in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) by enabling the GPIO_EVENT_9 or GPIO_EVENT_8 bits of the [1588 Configuration Register \(1588_CONFIG\)](#). The clock event polarity, which determines whether the IEEE 1588 GPIO output is active high or active low, is controlled via the GPIO_EVENT_POL_9 and GPIO_EVENT_POL_8 bits of the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#).

Note: The 1588_GPIO_OE[9:8] bits do not override the GPIO buffer type bits GPIOBUF[9:8] in the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#).

12.2.2 GPIO Interrupts

Each GPIO of the LAN9313/LAN9313i provides the ability to trigger a unique GPIO interrupt in the [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#). Reading the GPIO_INT[11:0] bits of this register provides the current status of the corresponding interrupt, and each interrupt is enabled by setting the corresponding GPIO_INT_EN[11:0] bit. The GPIO/LED Controller aggregates the enabled interrupt values into an internal signal which is sent to the System Interrupt Controller and is reflected via the [Interrupt Status Register \(INT_STS\)](#) bit 12 (GPIO). For more information on the LAN9313/LAN9313i interrupts, refer to [Chapter 5, "System Interrupts," on page 52](#).

12.2.2.1 GPIO Interrupt Polarity

The interrupt polarity can be set for each individual GPIO via the GPIO_INT_POL[11:0] bits in the [General Purpose I/O Configuration Register \(GPIO_CFG\)](#). When set, a high logic level on the GPIO pin will set the corresponding interrupt bit in the [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#). When cleared, a low logic level on the GPIO pin will set the corresponding interrupt bit. Because GPIO[9:8] have added IEEE 1588 functionality, the

GPIO_INT_POL[9:8] bits also determine the polarity of the clock events as described in [Section 12.2.1.2](#).

12.2.2.2 IEEE 1588 GPIO Interrupts

In addition to the standard GPIO interrupts in the [General Purpose I/O Interrupt Status and Enable Register \(GPIO_INT_STS_EN\)](#), the IEEE 1588 timestamp enabled GPIO[9:8] pins contain the ability to generate and clear specific IEEE 1588 related interrupts. When GPIO 9 or GPIO 8 are enabled as inputs and an active edge occurs, the IEEE 1588 clock capture is indicated by the 1588_GPIO9_INT and 1588_GPIO8_INT interrupts respectively in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#). These interrupts are enabled by setting the corresponding 1588_GPIO9_EN and 1588_GPIO8_EN bits in the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#). GPIO inputs must be active for greater than 40nS to be recognized as capture events.

When GPIO 8 and GPIO 9 are enabled, the 1588 Timer Interrupt bit (1588_TIMER_INT) of the [1588 Interrupt Status and Enable Register \(1588_INT_STS_EN\)](#) can be cleared by an active edge on GPIO[9:8]. A clear is only registered when the GPIO input is active for greater than 40nS.

12.3 LED Operation

Eight pins, GPIO[7:0], are shared with LED functions (nP1LED[3:0] and nP2LED[3:0]). These pins are configured as LED outputs by setting the corresponding LED_EN bit in the [LED Configuration Register \(LED_CFG\)](#). When configured as a LED, the pin is an open-drain, active-low output and the GPIO related input buffer and pull-up are disabled. The LED outputs are always active low. As a result, a low signal on the LED pin equates to the LED “on”, and a high signal equates to the LED “off”.

The functions associated with each LED pin are configurable via the LED_FUN[1:0] bits of the [LED Configuration Register \(LED_CFG\)](#). These bits allow the configuration of each LED pin to indicate various port related functions. These functions are described in [Table 12.1](#) followed by a detailed definition of each indication type.

The default values of the LED_FUN[1:0] and LED_EN[7:0] bits of the [LED Configuration Register \(LED_CFG\)](#) are determined by the LED_fun_strap[1:0] and LED_en_strap[7:0] configuration straps. For more information on the [LED Configuration Register \(LED_CFG\)](#) and its related straps, refer to [Section 13.1.2.4, "LED Configuration Register \(LED_CFG\)," on page 159](#).

Table 12.1 LED Operation as a Function of LED_CFG[9:8]

	LED_CFG[9:8] (LED_FUN[1:0])			
	00b	01b	10b	11b
nP2LED3 (GPIO7)	RX Port 0	RX Port 0	Activity Port 2	-
nP2LED2 (GPIO6)	Link / Activity Port 2	100Link / Activity Port 2	Link Port 2	-
nP2LED1 (GPIO5)	Full-duplex / Collision Port 2	Full-duplex / Collision Port 2	Full-duplex / Collision Port 2	TXEN Port 2
nP2LED0 (GPIO4)	Speed Port 2	10Link / Activity Port 2	Speed Port 2	RXDV Port 2
nP1LED3 (GPIO3)	TX Port 0	TX Port 0	Activity Port 1	TXEN Port 0
nP1LED2 (GPIO2)	Link / Activity Port 1	100Link / Activity Port 1	Link Port 1	RXDV Port 0

Table 12.1 LED Operation as a Function of LED_CFG[9:8] (continued)

	LED_CFG[9:8] (LED_FUN[1:0])			
nP1LED1 (GPIO1)	Full-duplex / Collision Port 1	Full-duplex / Collision Port 1	Full-duplex / Collision Port 1	TXEN Port 1
nP1LED0 (GPIO0)	Speed Port 1	10Link / Activity Port 1	Speed Port 1	RXDV Port 1

The various LED indication functions shown in [Table 12.1](#) are described below:

- **TX Port 0** - The signal is pulsed low for 80mS to indicate activity from the switch fabric to the external MII pins. This signal is then driven high for a minimum of 80mS, after which the process will repeat if TX activity is again detected.
- **RX Port 0** - The signal is pulsed low for 80mS to indicate activity from the external MII pins to the switch fabric. This signal is then driven high for a minimum of 80mS, after which the process will repeat if RX activity is again detected.
- **Link / Activity** - A steady low output indicates that the port has a valid link, while a steady high indicates no link on the port. The signal is pulsed high for 80mS to indicate transmit or receive activity on the port. The signal is then driven low for a minimum of 80mS, after which the process will repeat if RX or TX activity is again detected.
- **Full-duplex / Collision** - A steady low output indicates the port is in full-duplex mode, while a steady high indicates no link on the port. In half-duplex mode, the signal is pulsed low for 80mS to indicate a network collision. The signal is then driven high for a minimum of 80mS, after which the process will repeat if another collision is detected.
- **Speed** - A steady low output indicates the selected speed is 100Mbps. A steady high output indicates the selected speed is 10Mbps. The signal will be held high if the port does not have a valid link.
- **100Link / Activity** - A steady low output indicates the port has a valid link and the speed is 100Mbps. The signal is pulsed high for 80mS to indicate TX or RX activity on the port. The signal is then driven low for a minimum of 80mS, after which the process will repeat if RX or TX activity is again detected. The signal will be held high if the port does not have a valid link.
- **10Link / Activity** - A steady low output indicates the port has a valid link and the speed is 10Mbps. The signal is pulsed high for 80mS to indicate transmit or receive activity on the port. The signal is then driven low for a minimum of 80mS, after which the process will repeat if RX or TX activity is again detected. This signal will be held high if the port does not have a valid link.
- **Activity** - The signal is pulsed low for 80mS to indicate transmit or receive activity. The signal is then driven high for a minimum of 80mS, after which the process will repeat if RX or TX activity is again detected. The signal will be held high if the port does not have a valid link.
- **Link** - A steady low indicates the port has a valid link.
- **TXEN Port 0** - Non-stretched TXEN signal from the switch fabric to the external MII pins.
- **RXDV Port 0** - Non-stretched RXDV signal from the external MII pins to the switch fabric.
- **TXEN** - Non-stretched TXEN signal from the switch fabric to the PHY.
- **RXDV** - Non-stretched RXDV signal from the PHY to the switch fabric.

Chapter 13 Register Descriptions

This section describes the various LAN9313/LAN9313i control and status registers (CSR's). These registers are broken into 3 categories. The following sections detail the functionality and accessibility of all the LAN9313/LAN9313i registers within each category:

- Section 13.1, "System Control and Status Registers," on page 147
- Section 13.2, "Ethernet PHY Control and Status Registers," on page 231
- Section 13.3, "Switch Fabric Control and Status Registers," on page 253

Figure 13.1 contains an overall base register memory map of the LAN9313/LAN9313i. This memory map is not drawn to scale, and should be used for general reference only.

Note: Register bit type definitions are provided in Section 1.3, "Register Nomenclature," on page 17.

Note: Not all LAN9313/LAN9313i registers are memory mapped or directly addressable. For details on the accessibility of the various LAN9313/LAN9313i registers, refer the register sub-sections listed above.

Figure 13.1 LAN9313/LAN9313i Base Register Memory Map

13.1 System Control and Status Registers

The System CSR's are directly addressable memory mapped registers with a base address offset range of 050h to 2DCh. These registers are accessed through the I²C/SPI serial interfaces or the MIIM/SMI serial interface. For more information on the various LAN9313/LAN9313i modes and their corresponding address configurations, see [Section 2.3, "Modes of Operation,"](#) on page 23.

[Table 13.1](#) lists the System CSR's and their corresponding addresses in order. All system CSR's are reset to their default value on the assertion of a chip-level reset.

The System CSR's can be divided into 8 sub-categories. Each of these sub-categories contains the System CSR descriptions of the associated registers. The register descriptions are categorized as follows:

- [Section 13.1.1, "Interrupts,"](#) on page 151
- [Section 13.1.2, "GPIO/LED,"](#) on page 155
- [Section 13.1.3, "EEPROM,"](#) on page 160
- [Section 13.1.4, "IEEE 1588,"](#) on page 164
- [Section 13.1.5, "Switch Fabric,"](#) on page 192
- [Section 13.1.6, "PHY Management Interface \(PMI\),"](#) on page 207
- [Section 13.1.7, "Virtual PHY,"](#) on page 209
- [Section 13.1.8, "Miscellaneous,"](#) on page 224

Datasheet

13.1.1 Interrupts

This section details the interrupt related System CSR's. These registers control, configure, and monitor the IRQ interrupt output pin and the various LAN9313/LAN9313i interrupt sources. For more information on the LAN9313/LAN9313i interrupts, refer to [Chapter 5, "System Interrupts," on page 52](#).

13.1.1.1 Interrupt Configuration Register (IRQ_CFG)

Offset: 054h Size: 32 bits

This read/write register configures and indicates the state of the IRQ signal.

BITS	DESCRIPTION	TYPE	DEFAULT
31:24	<p>Interrupt De-assertion Interval (INT_DEAS) This field determines the Interrupt Request De-assertion Interval in multiples of 10 microseconds.</p> <p>Setting this field to zero causes the device to disable the INT_DEAS Interval, reset the interval counter and issue any pending interrupts. If a new, non-zero value is written to this field, any subsequent interrupts will obey the new setting.</p>	R/W	00h
23:15	RESERVED	RO	-
14	<p>Interrupt De-assertion Interval Clear (INT_DEAS_CLR) Writing a 1 to this register clears the de-assertion counter in the Interrupt Controller, thus causing a new de-assertion interval to begin (regardless of whether or not the Interrupt Controller is currently in an active de-assertion interval).</p> <p>0: Normal operation 1: Clear de-assertion counter</p>	R/W SC	0h
13	<p>Interrupt De-assertion Status (INT_DEAS_STS) When set, this bit indicates that interrupts are currently in a de-assertion interval, and will not be sent to the IRQ pin. When this bit is clear, interrupts are not currently in a de-assertion interval, and will be sent to the IRQ pin.</p> <p>0: No interrupts in de-assertion interval 1: Interrupts in de-assertion interval</p>	RO SC	0b
12	<p>Master Interrupt (IRQ_INT) This read-only bit indicates the state of the internal IRQ line, regardless of the setting of the IRQ_EN bit, or the state of the interrupt de-assertion function. When this bit is set, one of the enabled interrupts is currently active.</p> <p>0: No enabled interrupts active 1: One or more enabled interrupts active</p>	RO	0b
11:9	RESERVED	RO	-
8	<p>IRQ Enable (IRQ_EN) This bit controls the final interrupt output to the IRQ pin. When clear, the IRQ output is disabled and permanently de-asserted. This bit has no effect on any internal interrupt status bits.</p> <p>0: Disable output on IRQ pin 1: Enable output on IRQ pin</p>	R/W	0b
7:5	RESERVED	RO	-

BITS	DESCRIPTION	TYPE	DEFAULT
4	IRQ Polarity (IRQ_POL) When cleared, this bit enables the IRQ line to function as an active low output. When set, the IRQ output is active high. When the IRQ is configured as an open-drain output (via the IRQ_TYPE bit), this bit is ignored, and the interrupt is always active low. 0: IRQ active low output 1: IRQ active high output	R/W NASR Note 13.1	0b
3:1	RESERVED	RO	-
0	IRQ Buffer Type (IRQ_TYPE) When this bit is cleared, the IRQ pin functions as an open-drain output for use in a wired-or interrupt configuration. When set, the IRQ is a push-pull driver. Note: When configured as an open-drain output, the IRQ_POL bit is ignored and the interrupt output is always active low. 0: IRQ pin open-drain output 1: IRQ pin push-pull driver	R/W NASR Note 13.1	0b

Note 13.1 Register bits designated as NASR are not reset when the DIGITAL_RST bit in the [Reset Control Register \(RESET_CTL\)](#) is set.

Datasheet

13.1.1.2 Interrupt Status Register (INT_STS)

Offset: 058h Size: 32 bits

This register contains the current status of the generated interrupts. A value of 1 indicates the corresponding interrupt conditions have been met, while a value of 0 indicates the interrupt conditions have not been met. The bits of this register reflect the status of the interrupt source regardless of whether the source has been enabled as an interrupt in the [Interrupt Enable Register \(INT_EN\)](#). Where indicated as R/WC, writing a 1 to the corresponding bits acknowledges and clears the interrupt.

BITS	DESCRIPTION	TYPE	DEFAULT
31	Software Interrupt (SW_INT) This interrupt is generated when the SW_INT_EN bit of the Interrupt Enable Register (INT_EN) is set high. Writing a one clears this interrupt.	R/WC	0b
30	Device Ready (READY) This interrupt indicates that the LAN9313/LAN9313i is ready to be accessed after a power-up or reset condition.	R/WC	0b
29	1588 Interrupt Event (1588_EVNT) This bit indicates an interrupt event from the IEEE 1588 module. This bit should be used in conjunction with the 1588 Interrupt Status and Enable Register (1588_INT_STS_EN) to determine the source of the interrupt event within the 1588 module.	RO	0b
28	Switch Fabric Interrupt Event (SWITCH_INT) This bit indicates an interrupt event from the Switch Fabric. This bit should be used in conjunction with the Switch Global Interrupt Pending Register (SW_IPR) to determine the source of the interrupt event within the Switch Fabric.	RO	0b
27	Port 2 PHY Interrupt Event (PHY_INT2) This bit indicates an interrupt event from the Port 2 PHY. The source of the interrupt can be determined by polling the Port x PHY Interrupt Source Flags Register (PHY_INTERRUPT_SOURCE_x) .	RO	0b
26	Port 1 PHY Interrupt Event (PHY_INT1) This bit indicates an interrupt event from the Port 1 PHY. The source of the interrupt can be determined by polling the Port x PHY Interrupt Source Flags Register (PHY_INTERRUPT_SOURCE_x) .	RO	0b
25:20	RESERVED	RO	-
19	GP Timer (GPT_INT) This interrupt is issued when the General Purpose Timer Count Register (GPT_CNT) wraps past zero to FFFFh.	R/WC	0b
18:13	RESERVED	RO	-
12	GPIO Interrupt Event (GPIO) This bit indicates an interrupt event from the General Purpose I/O. The source of the interrupt can be determined by polling the General Purpose I/O Interrupt Status and Enable Register (GPIO_INT_STS_EN)	RO	0b
11:0	RESERVED	RO	-

13.1.1.3 Interrupt Enable Register (INT_EN)

Offset: 05Ch Size: 32 bits

This register contains the interrupt enables for the IRQ output pin. Writing 1 to any of the bits enables the corresponding interrupt as a source for IRQ. Bits in the [Interrupt Status Register \(INT_STS\)](#) register will still reflect the status of the interrupt source regardless of whether the source is enabled as an interrupt in this register (with the exception of SW_INT_EN). For descriptions of each interrupt, refer to the [Interrupt Status Register \(INT_STS\)](#) bits, which mimic the layout of this register.

BITS	DESCRIPTION	TYPE	DEFAULT
31	Software Interrupt Enable (SW_INT_EN)	R/W	0b
30	Device Ready Enable (READY_EN)	R/W	0b
29	1588 Interrupt Event Enable (1588_EVNT_EN)	R/W	0b
28	Switch Engine Interrupt Event Enable (SWITCH_INT_EN)	R/W	0b
27	Port 2 PHY Interrupt Event Enable (PHY_INT2_EN)	R/W	0b
26	Port 1 PHY Interrupt Event Enable (PHY_INT1_EN)	R/W	0b
25:20	RESERVED	RO	-
19	GP Timer Interrupt Enable (GPT_INT_EN)	R/W	0b
18:13	RESERVED	RO	-
12	GPIO Interrupt Event Enable (GPIO_EN)	R/W	0b
11:0	RESERVED	RO	-

Datasheet

13.1.2 GPIO/LED

This section details the General Purpose I/O (GPIO) and LED related System CSR's.

13.1.2.1 General Purpose I/O Configuration Register (GPIO_CFG)

Offset: 1E0h Size: 32 bits

This read/write register configures the GPIO input and output pins. The polarity of the 12 GPIO pins is configured here as well as the IEEE 1588 timestamping and clock compare event output properties of the GPIO[9:8] pins.

BITS	DESCRIPTION	TYPE	DEFAULT
31:30	RESERVED	RO	-
29:28	<p>GPIO 1588 Timer Interrupt Clear Enable 9-8 (GPIO_1588_TIMER_INT_CLEAR_EN[9:8]) These bits enable inputs on GPIO9 and GPIO8 to clear the 1588_TIMER_INT bit of the 1588 Interrupt Status and Enable Register (1588_INT_STS_EN). The polarity of these inputs is determined by GPIO_INT_POL[9:8].</p> <p>Note: The GPIO must be configured as an input for this function to operate. For the clear function, GPIO inputs are edge sensitive and must be active for greater than 40 nS to be recognized.</p>	R/W	00b
27:16	<p>GPIO Interrupt Polarity 11-0 (GPIO_INT_POL[11:0]) These bits set the interrupt polarity of the 12 GPIO pins. The configured level (high/low) will set the corresponding GPIO_INT bit in the General Purpose I/O Interrupt Status and Enable Register (GPIO_INT_STS_EN).</p> <p>0: Sets low logic level trigger on corresponding GPIO pin 1: Sets high logic level trigger on corresponding GPIO pin</p> <p>GPIO_INT_POL[9:8] also determines the polarity of the GPIO IEEE 1588 time clock capture events and the GPIO 1588 Timer Interrupt Clear inputs. Refer to Section 12.2, "GPIO Operation," on page 142 for additional information.</p>	R/W	0h
15:14	<p>1588 GPIO Output Enable 9-8 (1588_GPIO_OE[9:8]) These bits configure GPIO 9 and GPIO 8 to output 1588 clock compare events.</p> <p>0: Disables the output of 1588 clock compare events 1: Enables the output of 1588 clock compare events</p> <p>Note: These bits override the direction bits in the General Purpose I/O Data & Direction Register (GPIO_DATA_DIR) register. However, the GPIO buffer type (GPIOBUF[11:0]) in the General Purpose I/O Configuration Register (GPIO_CFG) is not overridden.</p>	R/W	0h
13	<p>GPIO 9 Clock Event Polarity (GPIO_EVENT_POL_9) This bit determines if the 1588 clock event output on GPIO 9 is active high or low.</p> <p>0: 1588 clock event output active low 1: 1588 clock event output active high</p>	R/W	1b
12	<p>GPIO 8 Clock Event Polarity (GPIO_EVENT_POL_8) This bit determines if the 1588 clock event output on GPIO 8 is active high or low.</p> <p>0: 1588 clock event output active low 1: 1588 clock event output active high</p>	R/W	1b

BITS	DESCRIPTION	TYPE	DEFAULT															
11:0	<p>GPIO Buffer Type 11-0 (GPIOBUF[11:0]) This field sets the buffer types of the 12 GPIO pins.</p> <p>0: Corresponding GPIO pin configured as an open-drain driver 1: Corresponding GPIO pin configured as a push/pull driver</p> <p>As an open-drain driver, the output pin is driven low when the corresponding data register is cleared, and is not driven when the corresponding data register is set.</p> <p>As an open-drain driver used for 1588 Clock Events, the corresponding GPIO_EVENT_POL_8 and GPIO_EVENT_POL_9 bits determine when the corresponding pin is driven per the following table:</p> <table border="1" data-bbox="321 604 1112 779"> <thead> <tr> <th>GPIOx Clock Event Polarity</th> <th>1588 Clock Event</th> <th>Pin State</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>no</td> <td>not driven</td> </tr> <tr> <td>0</td> <td>yes</td> <td>driven low</td> </tr> <tr> <td>1</td> <td>no</td> <td>driven low</td> </tr> <tr> <td>1</td> <td>yes</td> <td>not driven</td> </tr> </tbody> </table>	GPIOx Clock Event Polarity	1588 Clock Event	Pin State	0	no	not driven	0	yes	driven low	1	no	driven low	1	yes	not driven	R/W	0h
GPIOx Clock Event Polarity	1588 Clock Event	Pin State																
0	no	not driven																
0	yes	driven low																
1	no	driven low																
1	yes	not driven																

Datasheet**13.1.2.2 General Purpose I/O Data & Direction Register (GPIO_DATA_DIR)**

Offset: 1E4h Size: 32 bits

This read/write register configures the direction of the 12 GPIO pins and contains the GPIO input and output data bits.

BITS	DESCRIPTION	TYPE	DEFAULT
31:28	RESERVED	RO	-
27:16	GPIO Direction 11-0 (GPIODIR[11:0]) These bits set the input/output direction of the 12 GPIO pins. 0: GPIO pin is configured as an input 1: GPIO pin is configured as an output	R/W	0h
15:12	RESERVED	RO	-
11:0	GPIO Data 11-0 (GPIOD[11:0]) When a GPIO pin is enabled as an output, the value written to this field is output on the corresponding GPIO pin. Upon a read, the value returned depends on the current direction of the pin. If the pin is an input, the data reflects the current state of the corresponding GPIO pin. If the pin is an output, the data is the value that was last written into this register. For GPIOs 11-10 and 7-0, the pin direction is determined by the GPDIR bits of this register. For GPIOs 9 and 8, the pin direction is determined by the GPDIR bits and the 1588_GPIO_OE bits in the General Purpose I/O Configuration Register (GPIO_CFG) .	R/W	0h

13.1.2.3 General Purpose I/O Interrupt Status and Enable Register (GPIO_INT_STS_EN)

Offset: 1E8h Size: 32 bits

This read/write register contains the GPIO interrupt status bits.

Writing a 1 to any of the interrupt status bits acknowledges and clears the interrupt. If enabled, these interrupt bits are cascaded into bit 12 (GPIO) of the [Interrupt Status Register \(INT_STS\)](#). Writing a 1 to any of the interrupt enable bits will enable the corresponding interrupt as a source. Status bits will still reflect the status of the interrupt source regardless of whether the source is enabled as an interrupt in this register. Bit 12 (GPIO_EN) of the [Interrupt Enable Register \(INT_EN\)](#) must also be set in order for an actual system level interrupt to occur. Refer to [Chapter 5, "System Interrupts,"](#) on page 52 for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:28	RESERVED	RO	-
27:16	GPIO Interrupt Enable[11:0] (GPIO[11:0]_INT_EN) When set, these bits enable the corresponding GPIO interrupt. Note: The GPIO interrupts must also be enabled via bit 12 (GPIO_EN) of the Interrupt Enable Register (INT_EN) in order to cause the interrupt pin (IRQ) to be asserted.	R/W	0h
15:12	RESERVED	RO	-
11:0	GPIO Interrupt[11:0] (GPIO[11:0]_INT) These signals reflect the interrupt status as generated by the GPIOs. These interrupts are configured through the General Purpose I/O Configuration Register (GPIO_CFG) . Note: As GPIO interrupts, GPIO inputs are level sensitive and must be active greater than 40 nS to be recognized as interrupt inputs.	R/WC	0h

Datasheet

13.1.2.4 LED Configuration Register (LED_CFG)

Offset: 1BCh Size: 32 bits

This read/write register configures the GPIO[7:0] pins as LED[7:0] pins and sets their functionality.

BITS	DESCRIPTION	TYPE	DEFAULT
31:10	RESERVED	RO	-
9:8	LED Function 1-0 (LED_FUN[1:0]) These bits control the function associated with each LED pin as shown in Table 12.1 of Section 12.3, "LED Operation," on page 144. Note: In order for these assignments to be valid, the particular pin must be enabled as an LED output pin via the LED_EN[7:0] bits of this register.	R/W	Note 13.2
7:0	LED Enable 7-0 (LED_EN[7:0]) This field toggles the functionality of the GPIO[7:0] pins between GPIO and LED. 0: Enables the associated pin as a GPIO signal 1: Enables the associated pin as a LED output	R/W	Note 13.3

Note 13.2 The default value of this field is determined by the configuration strap LED_fun_strap[1:0]. Configuration strap values are latched on power-on reset or nRST de-assertion. Some configuration straps can be overridden by values from the EEPROM Loader. Refer to [Section 4.2.4, "Configuration Straps,"](#) on page 45 for more information.

Note 13.3 The default value of this field is determined by the configuration strap LED_en_strap[7:0]. Configuration strap values are latched on power-on reset or nRST de-assertion. Some configuration straps can be overridden by values from the EEPROM Loader. Refer to [Section 4.2.4, "Configuration Straps,"](#) on page 45 for more information.

13.1.3 EEPROM

This section details the EEPROM related System CSR's. These registers should only be used if an EEPROM has been connected to the LAN9313/LAN9313i. Refer to chapter [Section 8.2, "I2C/Microwire Master EEPROM Controller," on page 101](#) for additional information on the various modes (I²C and Microwire) of the EEPROM Controller (EPC).

13.1.3.1 EEPROM Command Register (E2P_CMD)

Offset: 1B4h Size: 32 bits

This read/write register is used to control the read and write operations of the serial EEPROM.

BITS	DESCRIPTION	TYPE	DEFAULT
31	<p>EEPROM Controller Busy (EPC_BUSY) When a 1 is written into this bit, the operation specified in the EPC_COMMAND field of this register is performed at the specified EEPROM address. This bit will remain set until the selected operation is complete. In the case of a read, this indicates that the Host can read valid data from the EEPROM Data Register (E2P_DATA). The E2P_CMD and E2P_DATA registers should not be modified until this bit is cleared. In the case where a write is attempted and an EEPROM is not present, the EPC_BUSY bit remains set until the EEPROM Controller Timeout (EPC_TIMEOUT) bit is set. At this time the EPC_BUSY bit is cleared.</p> <p>Note: EPC_BUSY is set immediately following power-up, or pin reset, or DIGITAL_RST reset. After the EEPROM Loader has finished loading, the EPC_BUSY bit is cleared. Refer to chapter Section 8.2.4, "EEPROM Loader," on page 113 for more information.</p>	R/W SC	0b

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT																																				
30:28	<p>EEPROM Controller Command (EPC_COMMAND) This field is used to issue commands to the EEPROM controller. The EEPROM controller will execute a command when the EPC_BUSY bit is set. A new command must not be issued until the previous command completes. The field is encoded as follows:</p> <table border="1" data-bbox="326 401 1101 709"> <thead> <tr> <th>[30]</th> <th>[29]</th> <th>[28]</th> <th>Operation</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>READ</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>EWDS</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>EWEN</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>WRITE</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>WRAL</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>ERASE</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>ERAL</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>RELOAD</td> </tr> </tbody> </table> <p>Note: Only the READ, WRITE and RELOAD commands are valid for I²C mode. If an unsupported command is attempted, the EPC_BUSY bit will be cleared and EPC_TIMEOUT will be set.</p> <p>The EEPROM operations are defined as follows:</p> <p>READ (Read Location) This command will cause a read of the EEPROM location pointed to by the EPC_ADDRESS bit field. The result of the read is available in the EEPROM Data Register (E2P_DATA).</p> <p>EWDS (Erase/Write Disable) (Microwire mode only) - When this command is issued, the EEPROM will ignore erase and write commands. To re-enable erase/writes operations, issue the EWEN command.</p> <p>EWEN (Erase/Write Enable) (Microwire mode only) - Enables the EEPROM for erase and write operations. The EEPROM will allow erase and write operations until the EWDS command is sent, or until the power is cycled. The Microwire EEPROM device will power-up in the erase/write disabled state. Any erase or write operations will fail until an EWEN command is issued.</p> <p>WRITE (Write Location) If erase/write operations are enabled in the EEPROM, this command will cause the contents of the EEPROM Data Register (E2P_DATA) to be written to the EEPROM location selected by the EPC_ADDRESS field. For Microwire, erase/write operations must be enabled in the EEPROM.</p> <p>WRAL (Write All) (Microwire mode only) - If erase/write operations are enabled in the EEPROM, this command will cause the contents of the EEPROM Data Register (E2P_DATA) to be written to every EEPROM memory location.</p> <p>ERASE (Erase Location) (Microwire mode only) - If erase/write operations are enabled in the EEPROM, this command will erase the location selected by the EPC_ADDRESS field.</p> <p>ERAL (Erase All) (Microwire mode only) - If erase/write operations are enabled in the EEPROM, this command will initiate a bulk erase of the entire EEPROM.</p> <p>RELOAD (EEPROM Loader Reload) Instructs the EEPROM Loader to reload the device from the EEPROM. If a value of A5h is not found in the first address of the EEPROM, the EEPROM is assumed to be un-programmed and the RELOAD operation will fail. The CFG_LOADED bit indicates a successful load. Following this command, the device will enter the not ready state. The READY bit in the Hardware Configuration Register (HW_CFG) should be polled to determine then the RELOAD is complete.</p>	[30]	[29]	[28]	Operation	0	0	0	READ	0	0	1	EWDS	0	1	0	EWEN	0	1	1	WRITE	1	0	0	WRAL	1	0	1	ERASE	1	1	0	ERAL	1	1	1	RELOAD	R/W	000b
[30]	[29]	[28]	Operation																																				
0	0	0	READ																																				
0	0	1	EWDS																																				
0	1	0	EWEN																																				
0	1	1	WRITE																																				
1	0	0	WRAL																																				
1	0	1	ERASE																																				
1	1	0	ERAL																																				
1	1	1	RELOAD																																				
27:19	RESERVED	RO	-																																				

BITS	DESCRIPTION	TYPE	DEFAULT
18	<p>EEPROM Loader Address Overflow (LOADER_OVERFLOW) This bit indicates that the EEPROM Loader tried to read past the end of the EEPROM address space. This indicates misconfigured EEPROM data.</p> <p>This bit is cleared when the EEPROM Loader is restarted with a RELOAD command, or a Digital Reset(DIGITAL_RST).</p>	RO	0b
17	<p>EEPROM Controller Timeout (EPC_TIMEOUT) This bit is set when a timeout occurs, indicating the last operation was unsuccessful. If an EEPROM ERASE, ERAL, WRITE or WRAL operation is performed and no response is received from the EEPROM within 30mS, the EEPROM controller will timeout and return to its idle state.</p> <p>For the I²C mode, the bit is also set if the EEPROM fails to respond with the appropriate ACKs, if the EEPROM slave device holds the clock low for more than 30ms, or if an unsupported EPC_COMMAND is attempted.</p> <p>This bit is cleared when written high.</p> <p>Note: When in Microwire mode, if an EEPROM device is not connected, an internal pull-down on the EEDI pin will keep the EEDI signal low and allow timeouts to occur. If EEDI is pulled high externally, EPC commands will not time out if an EEPROM device is not connected. In this case the EPC_BUSY bit will be cleared as soon as the command sequence is complete. It should also be noted that the ERASE, ERAL, WRITE and WRAL commands are the only EPC commands that will timeout if an EEPROM device is not present <i>AND</i> the EEDI signal is pulled low.</p>	R/WC	0b
16	<p>Configuration Loaded (CFG_LOADED) When set, this bit indicates that a valid EEPROM was found and the EEPROM Loader completed normally. This bit is set upon a successful load. It is cleared on power-up, pin and DIGITAL_RST resets, or at the start of a RELOAD.</p> <p>This bit is cleared when written high.</p>	RO	0b
15:0	<p>EEPROM Controller Address (EPC_ADDRESS) This field is used by the EEPROM Controller to address a specific memory location in the serial EEPROM. This address must be byte aligned.</p>	R/W	0000h

Datasheet**13.1.3.2 EEPROM Data Register (E2P_DATA)**

Offset: 1B8h Size: 32 bits

This read/write register is used in conjunction with the [EEPROM Command Register \(E2P_CMD\)](#) to perform read and write operations with the serial EEPROM.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7:0	EEPROM Data (EEPROM_DATA) This field contains the data read from or written to the EEPROM.	R/W	00h

13.1.4 IEEE 1588

This section details the IEEE 1588 timestamp related registers. Each port of the LAN9313/LAN9313i has a 1588 timestamp block with 8 related registers, 4 for transmit capture and 4 for receive capture. These sets of registers are identical in functionality for each port, and thus their register descriptions have been consolidated. In these cases, the register names will be amended with a lowercase “x” in place of the port designation. The wildcard “x” should be replaced with “1”, “2”, or “MII” for the Port 1, Port 2, and Port 0(External MII) respectively. A list of all the 1588 related registers can be seen in [Table 13.1](#). For more information on the IEEE 1588, refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#).

13.1.4.1 Port x 1588 Clock High-DWORD Receive Capture Register (1588_CLOCK_HI_RX_CAPTURE_x)

Offset:	Port 1: 100h	Size:	32 bits
	Port 2: 120h		
	Port 0: 140h		

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp High (TS_HI) This field contains the high 32-bits of the timestamp taken on the receipt of a 1588 Sync or Delay_Req packet.	RO	00000000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

Datasheet**13.1.4.2 Port x 1588 Clock Low-DWORD Receive Capture Register (1588_CLOCK_LO_RX_CAPTURE_x)**

Offset: Port 1: 104h Size: 32 bits
 Port 2: 124h
 Port 0: 144h

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp Low (TS_LO) This field contains the low 32-bits of the timestamp taken on the receipt of a 1588 Sync or Delay_Req packet.	RO	00000000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

**13.1.4.3 Port x 1588 Sequence ID, Source UUID High-WORD Receive Capture Register
(1588_SEQ_ID_SRC_UUID_HI_RX_CAPTURE_x)**

Offset: Port 1: 108h Size: 32 bits
 Port 2: 128h
 Port 0: 148h

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	Sequence ID (SEQ_ID) This field contains the Sequence ID from the 1588 Sync or Delay_Req packet.	RO	0000h
15:0	Source UUID High (SRC_UUID_HI) This field contains the high 16-bits of the Source UUID from the 1588 Sync or Delay_Req packet.	RO	0000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

Datasheet
**13.1.4.4 Port x 1588 Source UUID Low-DWORD Receive Capture Register
(1588_SRC_UUID_LO_RX_CAPTURE_x)**

Offset: Port 1: 10Ch Size: 32 bits
 Port 2: 12Ch
 Port 0: 14Ch

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Source UUID Low (SRC_UUID_LO) This field contains the low 32-bits of the Source UUID from the 1588 Sync or Delay_Req packet.	RO	00000000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

13.1.4.5 Port x 1588 Clock High-DWORD Transmit Capture Register (1588_CLOCK_HI_TX_CAPTURE_x)

Offset: Port 1: 110h Size: 32 bits
 Port 2: 130h
 Port 0: 150h

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp High (TS_HI) This field contains the high 32-bits of the timestamp taken on the transmission of a 1588 Sync or Delay_Req packet.	RO	00000000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

Datasheet**13.1.4.6 Port x 1588 Clock Low-DWORD Transmit Capture Register (1588_CLOCK_LO_TX_CAPTURE_x)**

Offset: Port 1: 114h Size: 32 bits
 Port 2: 134h
 Port 0: 154h

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp Low (TS_LO) This field contains the low 32-bits of the timestamp taken on the transmission of a 1588 Sync or Delay_Req packet.	RO	00000000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

**13.1.4.7 Port x 1588 Sequence ID, Source UUID High-WORD Transmit Capture Register
(1588_SEQ_ID_SRC_UUID_HI_TX_CAPTURE_x)**

Offset: Port 1: 118h Size: 32 bits
 Port 2: 138h
 Port 0: 158h

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	Sequence ID (SEQ_ID) This field contains the Sequence ID from the 1588 Sync or Delay_Req packet.	RO	0000h
15:0	Source UUID High (SRC_UUID_HI) This field contains the high 16-bits of the Source UUID from the 1588 Sync or Delay_Req packet.	RO	0000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

Datasheet
**13.1.4.8 Port x 1588 Source UUID Low-DWORD Transmit Capture Register
(1588_SRC_UUID_LO_TX_CAPTURE_x)**

Offset: Port 1: 11Ch Size: 32 bits
 Port 2: 13Ch
 Port 0: 15Ch

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Source UUID Low (SRC_UUID_TX_LO) This field contains the low 32-bits of the Source UUID from the 1588 Sync or Delay_Req packet.	RO	00000000h

Note: The selection between Sync or Delay_Req packets is based on the corresponding master/slave bit in the [1588 Configuration Register \(1588_CONFIG\)](#).

Note: There are multiple instantiations of this register, one for each port of the LAN9313/LAN9313i. Refer to [Section 13.1.4](#) for additional information.

Note: For Port 0(External MII), receive is defined as data *from* the switch fabric, while transmit is *to* the switch fabric.

13.1.4.9 GPIO 8 1588 Clock High-DWORD Capture Register (1588_CLOCK_HI_CAPTURE_GPIO_8)

Offset: 160h Size: 32 bits

This read only register combined with the [GPIO 8 1588 Clock Low-DWORD Capture Register \(1588_CLOCK_LO_CAPTURE_GPIO_8\)](#) form the 64-bit GPIO 8 timestamp capture.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp High (TS_HI) This field contains the high 32-bits of the timestamp upon activation of GPIO 8.	RO	00000000h

Datasheet**13.1.4.10 GPIO 8 1588 Clock Low-DWORD Capture Register (1588_CLOCK_LO_CAPTURE_GPIO_8)**

Offset: 164h Size: 32 bits

This read only register combined with the [GPIO 8 1588 Clock High-DWORD Capture Register \(1588_CLOCK_HI_CAPTURE_GPIO_8\)](#) form the 64-bit GPIO 8 timestamp capture.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp Low (TS_LO) This field contains the low 32-bits of the timestamp upon activation of GPIO 8.	RO	00000000h

13.1.4.11 GPIO 9 1588 Clock High-DWORD Capture Register (1588_CLOCK_HI_CAPTURE_GPIO_9)

Offset: 168h Size: 32 bits

This read only register combined with the [GPIO 9 1588 Clock Low-DWORD Capture Register \(1588_CLOCK_LO_CAPTURE_GPIO_9\)](#) form the 64-bit GPIO 9 timestamp capture.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp High (TS_HI) This field contains the high 32-bits of the timestamp upon activation of GPIO 9.	RO	00000000h

Datasheet**13.1.4.12 GPIO 9 1588 Clock Low-DWORD Capture Register (1588_CLOCK_LO_CAPTURE_GPIO_9)**

Offset: 16Ch Size: 32 bits

This read only register combined with the [GPIO 9 1588 Clock High-DWORD Capture Register \(1588_CLOCK_HI_CAPTURE_GPIO_9\)](#) form the 64-bit GPIO 9 timestamp capture.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Timestamp Low (TS_LO) This field contains the low 32-bits of the timestamp upon activation of GPIO 9.	RO	00000000h

13.1.4.13 1588 Clock High-DWORD Register (1588_CLOCK_HI)

Offset: 170h Size: 32 bits

This read/write register combined with [1588 Clock Low-DWORD Register \(1588_CLOCK_LO\)](#) form the 64-bit 1588 Clock value. The 1588 Clock value is used for all 1588 timestamping. The 1588 Clock has a base frequency of 100MHz, which can be adjusted via the [1588 Clock Addend Register \(1588_CLOCK_ADDEND\)](#) accordingly. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock High (CLOCK_HI) This field contains the high 32-bits of the 64-bit 1588 Clock.	R/W	00000000h

Note: Both this register and the [1588 Clock Low-DWORD Register \(1588_CLOCK_LO\)](#) must be written for either to be affected.

Note: The value read is the saved value of the 1588 Clock when the 1588_CLOCK_SNAPSHOT bit in the [1588 Command Register \(1588_CMD\)](#) is set.

Datasheet**13.1.4.14 1588 Clock Low-DWORD Register (1588_CLOCK_LO)**

Offset: 174h Size: 32 bits

This read/write register combined with [1588 Clock High-DWORD Register \(1588_CLOCK_HI\)](#) form the 64-bit 1588 Clock value. The 1588 Clock value is used for all 1588 timestamping. The 1588 Clock has a base frequency of 100MHz, which can be adjusted via the [1588 Clock Addend Register \(1588_CLOCK_ADDEND\)](#) accordingly. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock Low (CLOCK_LO) This field contains the low 32-bits of the 64-bit 1588 Clock.	R/W	00000000h

Note: Both this register and the [1588 Clock High-DWORD Register \(1588_CLOCK_HI\)](#) must be written for either to be affected.

Note: The value read is the saved value of the 1588 Clock when the 1588_CLOCK_SNAPSHOT bit in the [1588 Command Register \(1588_CMD\)](#) is set.

13.1.4.15 1588 Clock Addend Register (1588_CLOCK_ADDEND)

Offset: 178h Size: 32 bits

This read/write register is responsible for adjusting the 64-bit 1588 Clock frequency. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for details on how to properly use this register.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock Addend (CLOCK_ADDEND) This 32-bit value is added to the 1588 frequency divisor accumulator every cycle. This allows the base 100MHz frequency of the 64-bit 1588 Clock to be adjusted accordingly.	R/W	00000000h

Datasheet**13.1.4.16 1588 Clock Target High-DWORD Register (1588_CLOCK_TARGET_HI)**

Offset: 17Ch Size: 32 bits

This read/write register combined with [1588 Clock Target Low-DWORD Register \(1588_CLOCK_TARGET_LO\)](#) form the 64-bit 1588 Clock Target value. The 1588 Clock Target value is compared to the current 1588 Clock value and can be used to trigger an interrupt upon at match. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock Target High (CLOCK_TARGET_HI) This field contains the high 32-bits of the 64-bit 1588 Clock Compare value.	R/W	00000000h

Note: Both this register and the [1588 Clock Target Low-DWORD Register \(1588_CLOCK_TARGET_LO\)](#) must be written for either to be affected.

13.1.4.17 1588 Clock Target Low-DWORD Register (1588_CLOCK_TARGET_LO)

Offset: 180h Size: 32 bits

This read/write register combined with [1588 Clock Target High-DWORD Register \(1588_CLOCK_TARGET_HI\)](#) form the 64-bit 1588 Clock Target value. The 1588 Clock Target value is compared to the current 1588 Clock value and can be used to trigger an interrupt upon at match. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock Target Low (CLOCK_TARGET_LO) This field contains the low 32-bits of the 64-bit 1588 Clock Compare value.	R/W	00000000h

Note: Both this register and the [1588 Clock Target High-DWORD Register \(1588_CLOCK_TARGET_HI\)](#) must be written for either to be affected.

Datasheet**13.1.4.18 1588 Clock Target Reload High-DWORD Register (1588_CLOCK_TARGET_RELOAD_HI)**

Offset: 184h Size: 32 bits

This read/write register combined with [1588 Clock Target Reload/Add Low-DWORD Register \(1588_CLOCK_TARGET_RELOAD_LO\)](#) form the 64-bit 1588 Clock Target Reload value. The 1588 Clock Target Reload is the value that is reloaded to the 1588 Clock Compare value when a clock compare event occurs and the [Reload/Add \(RELOAD_ADD\)](#) bit of the [1588 Configuration Register \(1588_CONFIG\)](#) is set. Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit,"](#) on page 134 for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock Target Reload High (CLOCK_TARGET_RELOAD_HI) This field contains the high 32-bits of the 64-bit 1588 Clock Target Reload value that is reloaded to the 1588 Clock Compare value.	R/W	00000000h

Note: Both this register and the [1588 Clock Target Reload/Add Low-DWORD Register \(1588_CLOCK_TARGET_RELOAD_LO\)](#) must be written for either to be affected.

13.1.4.19 1588 Clock Target Reload/Add Low-DWORD Register (1588_CLOCK_TARGET_RELOAD_LO)

Offset: 188h Size: 32 bits

This read/write register combined with [1588 Clock Target Reload High-DWORD Register \(1588_CLOCK_TARGET_RELOAD_HI\)](#) form the 64-bit 1588 Clock Target Reload value. The 1588 Clock Target Reload is the value that is reloaded or added to the 1588 Clock Compare value when a clock compare event occurs. Whether this value is reloaded or added is determined by the [Reload/Add \(RELOAD_ADD\)](#) bit of the [1588 Configuration Register \(1588_CONFIG\)](#). Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit,"](#) on page 134 for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Clock Target Reload Low (CLOCK_TARGET_RELOAD_LO) This field contains the low 32-bits of the 64-bit 1588 Clock Target Reload value that is reloaded to the 1588 Clock Compare value. Alternatively, these 32-bits are added to the 1588 Clock Compare value when configured accordingly.	R/W	00000000h

Note: Both this register and the [1588 Clock Target Reload High-DWORD Register \(1588_CLOCK_TARGET_RELOAD_HI\)](#) must be written for either to be affected.

Datasheet**13.1.4.20 1588 Auxiliary MAC Address High-WORD Register (1588_AUX_MAC_HI)**

Offset: 18Ch Size: 32 bits

This read/write register combined with the [1588 Auxiliary MAC Address Low-DWORD Register \(1588_AUX_MAC_LO\)](#) forms the 48-bit Auxiliary (user defined) MAC address. The Auxiliary MAC address can be enabled for each port of the LAN9313/LAN9313i via their respective User Defined MAC Address Enable bit in the [1588 Configuration Register \(1588_CONFIG\)](#). Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit,"](#) on page 134 for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:0	Auxiliary MAC Address High (AUX_MAC_HI) This field contains the high 16-bits of the Auxiliary MAC address used for PTP packet detection.	R/W	0000h

13.1.4.21 1588 Auxiliary MAC Address Low-DWORD Register (1588_AUX_MAC_LO)

Offset: 190h Size: 32 bits

This read/write register combined with the [1588 Auxiliary MAC Address High-WORD Register \(1588_AUX_MAC_HI\)](#) forms the 48-bit Auxiliary (user defined) MAC address. The Auxiliary MAC address can be enabled for each port of the LAN9313/LAN9313i via their respective User Defined MAC Address Enable bit in the [1588 Configuration Register \(1588_CONFIG\)](#). Refer to [Chapter 10, "IEEE 1588 Hardware Time Stamp Unit," on page 134](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Auxiliary MAC Address Low (AUX_MAC_LO) This field contains the low 32-bits of the Auxiliary MAC address used for PTP packet detection.	R/W	00000000h

Datasheet

13.1.4.22 1588 Configuration Register (1588_CONFIG)

Offset: 194h Size: 32 bits

This read/write register is responsible for the configuration of the 1588 timestamps for all ports.

BITS	DESCRIPTION	TYPE	DEFAULT
31	Master/Slave Port 2 (M_nS_2) When set, Port 2 is a time clock master and captures timestamps when a Sync packet is transmitted and when a Delay_Req is received. When cleared, Port 2 is a time clock slave and captures timestamps when a Delay_Req packet is transmitted and when a Sync packet is received.	R/W	0b
30	Primary MAC Address Enable Port 2 (MAC_PRI_EN_2) This bit enables/disables the primary MAC address on Port 2. 0: Disables primary MAC address on Port 2 1: Enables MAC address 01:00:5E:00:01:81 as a PTP address on Port 2	R/W	1b
29	Alternate MAC Address 1 Enable Port 2 (MAC_ALT1_EN_2) This bit enables/disables the alternate MAC address 1 on Port 2. 0: Disables alternate MAC address on Port 2 1: Enables MAC address 01:00:5E:00:01:82 as a PTP address on Port 2	R/W	0b
28	Alternate MAC Address 2 Enable Port 2 (MAC_ALT2_EN_2) This bit enables/disables the alternate MAC address 2 on Port 2. 0: Disables alternate MAC address on Port 2 1: Enables MAC address 01:00:5E:00:01:83 as a PTP address on Port 2	R/W	0b
27	Alternate MAC Address 3 Enable Port 2 (MAC_ALT3_EN_2) This bit enables/disables the alternate MAC address 3 on Port 2. 0: Disables alternate MAC address on Port 2 1: Enables MAC address 01:00:5E:00:01:84 as a PTP address on Port 2	R/W	0b
26	User Defined MAC Address Enable Port 2 (MAC_USER_EN_2) This bit enables/disables the auxiliary MAC address on Port 2. The auxiliary address is defined via the 1588_AUX_MAC_HI and 1588_AUX_MAC_LO registers. 0: Disables auxiliary MAC address on Port 2 1: Enables auxiliary MAC address as a PTP address on Port 2	R/W	0b
25	Lock Enable RX Port 2 (LOCK_RX_2) This bit enables/disables the RX lock. This lock prevents a 1588 capture from overwriting the Clock, UUDI and Sequence ID values if the 1588 RX interrupt for Port 2 is already set due to a previous capture. 0: Disables RX Port 2 Lock 1: Enables RX Port 2 Lock	R/W	1b
24	Lock Enable TX Port 2 (LOCK_TX_2) This bit enables/disables the TX lock. This lock prevents a 1588 capture from overwriting the Clock, UUDI and Sequence ID values if the 1588 TX interrupt for Port 2 is already set due to a previous capture. 0: Disables TX Port 2 Lock 1: Enables TX Port 2 Lock	R/W	1b
23	Master/Slave Port 1 (M_nS_1) When set, Port 1 is a time clock master and captures timestamps when a Sync packet is transmitted and when a Delay_Req is received. When cleared, Port 1 is a time clock slave and captures timestamps when a Delay_Req packet is transmitted and when a Sync packet is received.	R/W	0b

BITS	DESCRIPTION	TYPE	DEFAULT
22	Primary MAC Address Enable Port 1 (MAC_PRI_EN_1) This bit enables/disables the primary MAC address on Port 1. 0: Disables primary MAC address on Port 1 1: Enables MAC address 01:00:5E:00:01:81 as a PTP address on Port 1	R/W	1b
21	Alternate MAC Address 1 Enable Port 1 (MAC_ALT1_EN_1) This bit enables/disables the alternate MAC address 1 on Port 1. 0: Disables alternate MAC address on Port 1 1: Enables MAC address 01:00:5E:00:01:82 as a PTP address on Port 1	R/W	0b
20	Alternate MAC Address 2 Enable Port 1 (MAC_ALT2_EN_1) This bit enables/disables the alternate MAC address 2 on Port 1. 0: Disables alternate MAC address on Port 1 1: Enables MAC address 01:00:5E:00:01:83 as a PTP address on Port 1	R/W	0b
19	Alternate MAC Address 3 Enable Port 1 (MAC_ALT3_EN_1) This bit enables/disables the alternate MAC address 3 on Port 1. 0: Disables alternate MAC address on Port 1 1: Enables MAC address 01:00:5E:00:01:84 as a PTP address on Port 1	R/W	0b
18	User Defined MAC Address Enable Port 1 (MAC_USER_EN_1) This bit enables/disables the auxiliary MAC address on Port 1. The auxiliary address is defined via the 1588_AUX_MAC_HI and 1588_AUX_MAC_LO registers. 0: Disables auxiliary MAC address on Port 1 1: Enables auxiliary MAC address as a PTP address on Port 1	R/W	0b
17	Lock Enable RX Port 1 (LOCK_RX_1) This bit enables/disables the RX lock. This lock prevents a 1588 capture from overwriting the Clock, UUDI and Sequence ID values if the 1588 RX interrupt for Port 1 is ready set due to a previous capture. 0: Disables RX Port 1 Lock 1: Enables RX Port 1 Lock	R/W	1b
16	Lock Enable TX Port 1 (LOCK_TX_1) This bit enables/disables the TX lock. This lock prevents a 1588 capture from overwriting the Clock, UUDI and Sequence ID values if the 1588 TX interrupt for Port 1 is ready set due to a previous capture. 0: Disables TX Port 1 Lock 1: Enables TX Port 1 Lock	R/W	1b
15	Master/Slave Port 0(External MII)(M_nS_MII) When set, Port 0 is a time clock master and captures timestamps when a Sync packet is transmitted and when a Delay_Req is received. When cleared, Port 0 is a time clock slave and captures timestamps when a Delay_Req packet is transmitted and when a Sync packet is received. Note: For Port 0, receive is defined as data <i>from</i> the switch fabric, while transmit is defined as data <i>to</i> the switch fabric.	R/W	0b
14	Primary MAC Address Enable Port 0(External MII) (MAC_PRI_EN_MII) This bit enables/disables the primary MAC address on Port 0. 0: Disables primary MAC address on Port 0 1: Enables MAC address 01:00:5E:00:01:81 as a PTP address on Port 0	R/W	1b

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
13	Alternate MAC Address 1 Enable Port 0(External MII) (MAC_ALT1_EN_MII) This bit enables/disables the alternate MAC address 1 on Port 0. 0: Disables alternate MAC address on Port 0 1: Enables MAC address 01:00:5E:00:01:82 as a PTP address on Port 0	R/W	0b
12	Alternate MAC Address 2 Enable Port 0(External MII) (MAC_ALT2_EN_MII) This bit enables/disables the alternate MAC address 2 on Port 0. 0: Disables alternate MAC address on Port 0 1: Enables MAC address 01:00:5E:00:01:83 as a PTP address on Port 0	R/W	0b
11	Alternate MAC Address 3 Enable Port 0(External MII) (MAC_ALT3_EN_MII) This bit enables/disables the alternate MAC address 3 on Port 0. 0: Disables alternate MAC address on Port 0 1: Enables MAC address 01:00:5E:00:01:84 as a PTP address on Port 0	R/W	0b
10	User Defined MAC Address Enable Port 0(External MII) (MAC_USER_EN_MII) This bit enables/disables the auxiliary MAC address on Port 0. The auxiliary address is defined via the 1588_AUX_MAC_HI and 1588_AUX_MAC_LO registers. 0: Disables auxiliary MAC address on Port 0 1: Enables auxiliary MAC address as a PTP address on Port 0	R/W	0b
9	Lock Enable RX Port 0(External MII) (LOCK_RX_MII) This bit enables/disables the RX lock. This lock prevents a 1588 capture from overwriting the Clock, UUDI and Sequence ID values if the 1588 RX interrupt for Port 0 is ready set due to a previous capture. 0: Disables RX Port 0 Lock 1: Enables RX Port 0 Lock Note: For Port 0, receive is defined as data <i>from</i> the switch fabric, while transmit is <i>to</i> the switch fabric.	R/W	1b
8	Lock Enable TX Port 0(External MII) (LOCK_TX_MII) This bit enables/disables the TX lock. This lock prevents a 1588 capture from overwriting the Clock, UUDI and Sequence ID values if the 1588 TX interrupt for Port 0 is ready set due to a previous capture. 0: Disables TX Port 0 Lock 1: Enables TX Port 0 Lock Note: For Port 0, receive is defined as data <i>from</i> the switch fabric, while transmit is <i>to</i> the switch fabric.	R/W	1b
7	RESERVED	RO	-
6	Lock Enable GPIO 9 (LOCK_GPIO_9) This bit enables/disables the GPIO 9 lock. This lock prevents a 1588 capture from overwriting the Clock value if the 1588_GPIO9 interrupt in the 1588 Interrupt Status and Enable Register (1588_INT_STS_EN) is already set due to a previous capture. 0: Disables GPIO 9 Lock 1: Enables GPIO 9 Lock	R/W	1b

BITS	DESCRIPTION	TYPE	DEFAULT
5	<p>Lock Enable GPIO 8 (LOCK_GPIO_8) This bit enables/disables the GPIO 8 lock. This lock prevents a 1588 capture from overwriting the Clock value if the 1588_GPIO8 interrupt in the 1588 Interrupt Status and Enable Register (1588_INT_STS_EN) is already set due to a previous capture.</p> <p>0: Disables GPIO 8 Lock 1: Enables GPIO 8 Lock</p>	R/W	1b
4:3	<p>GPIO 9 Clock Event Mode (GPIO_EVENT_9) These bits determine the output on GPIO 9 when a clock target compare event occurs.</p> <p>00: 100ns pulse output 01: Toggle output 10: 1588_TIMER_INT bit value in the 1588_INT_STS_EN register output 11: RESERVED</p> <p>Note: The 1588_GPIO_OE[9] bit in the General Purpose I/O Configuration Register (GPIO_CFG) must be set in order for the GPIO output to be controlled by the 1588 block.</p> <p>Note: The polarity of the pulse or level is set by the GPIO_EVENT_POL_9 bit in the General Purpose I/O Configuration Register (GPIO_CFG). The GPIOBUF[9] bit still determines the GPIO buffer type.</p>	R/W	00b
2:1	<p>GPIO 8 Clock Event Mode (GPIO_EVENT_8) These bits determine the output on GPIO 8 when a clock target compare event occurs.</p> <p>00: 100ns pulse output 01: Toggle output 10: 1588_TIMER_INT bit value in the 1588_INT_STS_EN register output 11: RESERVED</p> <p>Note: The 1588_GPIO_OE[8] bit in the General Purpose I/O Configuration Register (GPIO_CFG) must be set in order for the GPIO output to be controlled by the 1588 block.</p> <p>Note: The polarity of the pulse or level is set by the GPIO_EVENT_POL_8 bit in the General Purpose I/O Configuration Register (GPIO_CFG). The GPIOBUF[8] bit still determines the GPIO buffer type.</p>	R/W	00b
0	<p>Reload/Add (RELOAD_ADD) This bit determines the course of action when a clock target compare event occurs. When set, the 1588 Clock Target High-DWORD Register (1588_CLOCK_TARGET_HI) and 1588 Clock Target Low-DWORD Register (1588_CLOCK_TARGET_LO) are loaded from the 1588 Clock Target Reload High-DWORD Register (1588_CLOCK_TARGET_RELOAD_HI) and 1588 Clock Target Reload/Add Low-DWORD Register (1588_CLOCK_TARGET_RELOAD_LO) when a clock target compare event occurs. When low, the Clock Target Low and High Registers are incremented by the Clock Target Reload Low Register when a clock target compare event occurs.</p> <p>0: Reload upon a clock target compare event 1: Increment upon a clock target compare event</p>	R/W	0b

Datasheet

13.1.4.23 1588 Interrupt Status and Enable Register (1588_INT_STS_EN)

Offset: 198h Size: 32 bits

This read/write register contains the IEEE 1588 interrupt status and enable bits.

Writing a 1 to any of the interrupt status bits acknowledges and clears the interrupt. If enabled, these interrupt bits are cascaded into bit 29 (1588_EVNT) of the [Interrupt Status Register \(INT_STS\)](#). Writing a 1 to any of the interrupt enable bits will enable the corresponding interrupt as a source. Status bits will still reflect the status of the interrupt source regardless of whether the source is enabled as an interrupt in this register. Bit 29 (1588_EVNT_EN) of the [Interrupt Enable Register \(INT_EN\)](#) must also be set in order for an actual system level interrupt to occur. Refer to [Chapter 5, "System Interrupts," on page 52](#) for additional information.

For the clear function, GPIO inputs are edge sensitive and must be active for greater than 40 nS to be recognized as a clear input. Refer to Section 12.2, "GPIO Operation," on page 142 for additional information.</p>	R/WC	0b

Datasheet**13.1.4.24 1588 Command Register (1588_CMD)**

Offset: 19Ch Size: 32 bits

This register is used to issue 1588 commands. Using the clock snapshot bit allows the host to properly read the current IEEE 1588 clock values from the [1588 Clock High-DWORD Register \(1588_CLOCK_HI\)](#) and [1588 Clock Low-DWORD Register \(1588_CLOCK_LO\)](#). Refer to section [Section 10.3, "IEEE 1588 Clock,"](#) on page 139 for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Clock Snapshot (1588_CLOCK_SNAPSHOT) Setting this bit causes the current 1588 Clock High-DWORD Register (1588_CLOCK_HI) and 1588 Clock Low-DWORD Register (1588_CLOCK_LO) values to be saved so they can be read.	WO SC	0b

13.1.5 Switch Fabric

This section details the memory mapped System CSR's which are related to the Switch Fabric. The flow control of all three ports of the switch fabric can be configured via the memory mapped System CSR's MANUAL_FC_1, MANUAL_FC_2 and MANUAL_FC_MII. The MAC address used by the switch for Pause frames is configured via the SWITCH_MAC_ADDRH and SWITCH_MAC_ADDRL registers. In addition, the SWITCH_CSR_CMD, SWITCH_CSR_DATA and SWITCH_CSR_DIRECT_DATA registers serve as a memory mapped accessible interface to the full range of otherwise inaccessible switch control and status registers. A list of all the switch fabric CSRs can be seen in [Table 13.12](#). For additional information on the switch fabric, including a full explanation on how to use the switch fabric CSR interface registers, refer to [Chapter 6, "Switch Fabric," on page 57](#). For detailed descriptions of the Switch Fabric CSR's that are accessible via these interface registers, refer to section [Section 13.3, "Switch Fabric Control and Status Registers"](#).

13.1.5.1 Port 1 Manual Flow Control Register (MANUAL_FC_1)

Offset: 1A0h Size: 32 bits

This read/write register allows for the manual configuration of the switch Port 1 flow control. This register also provides read back of the currently enabled flow control settings, whether set manually or Auto-Negotiated. Refer to [Section 6.2.3, "Flow Control Enable Logic," on page 60](#) for additional information.

Note: The flow control values in the PHY_AN_ADV_1 register (see [Section 13.2.2.5, on page 239](#)) within the PHY are not affected by the values of this register.

BITS	DESCRIPTION	TYPE	DEFAULT
31:7	RESERVED	RO	-
6	Port 1 Backpressure Enable (BP_EN_1) This bit enables/disables the generation of half-duplex backpressure on switch Port 1. 0: Disable backpressure 1: Enable backpressure	R/W	Note 13.4

2	Port 1 Full-Duplex Receive Flow Control Enable (RX_FC_1) When the MANUAL_FC_1 bit is set, or Auto-Negotiation is disabled, this bit enables/disables the detection of full-duplex Pause packets on switch Port 1. 0: Disable flow control receive 1: Enable flow control receive	R/W	Note 13.6

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
1	Port 1 Full-Duplex Transmit Flow Control Enable (TX_FC_1) When the MANUAL_FC_1 bit is set, or Auto-Negotiation is disabled, this bit enables/disables full-duplex Pause packets to be generated on switch Port 1. 0: Disable flow control transmit 1: Enable flow control transmit	R/W	Note 13.6
0	Port 1 Full-Duplex Manual Flow Control Select (MANUAL_FC_1) This bit toggles flow control selection between manual and auto-negotiation. 0: If auto-negotiation is enabled, the auto-negotiation function determines the flow control of switch Port 1 (RX_FC_1 and TX_FC_1 values ignored). If auto-negotiation is disabled, the RX_FC_1 and TX_FC_1 values are used. 1: TX_FC_1 and RX_FC_1 bits determine the flow control of switch Port 1 when in full-duplex mode	R/W	Note 13.7

Note 13.4 The default value of this field is determined by the BP_EN_strap_1 configuration strap. The strap values are loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the values, this register is updated with the new values. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

Note 13.5 The default value of this bit is determined by multiple strap settings. The strap values are loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the values, this register is updated with the new values. Refer to [Section 6.2.3, "Flow Control Enable Logic," on page 60](#) for additional information.

Note 13.6 The default value of this field is determined by the FD_FC_strap_1 configuration strap. The strap values are loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the values, this register is updated with the new values. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

Note 13.7 The default value of this field is determined by the manual_FC_strap_1 configuration strap. The strap values are loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the values, this register is updated with the new values. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

13.1.5.2 Port 2 Manual Flow Control Register (MANUAL_FC_2)

Offset: 1A4h Size: 32 bits

This read/write register allows for the manual configuration of the switch Port 2 flow control. This register also provides read back of the currently enabled flow control settings, whether set manually or Auto-Negotiated. Refer to [Section 6.2.3, "Flow Control Enable Logic,"](#) on page 60 for additional information.

Note: The flow control values in the PHY_AN_ADV_2 register (see [Section 13.2.2.5, on page 239](#)) within the PHY are not affected by the values of this register.

The Virtual PHY is not applicable in this mode and full-duplex flow control should be controlled manually by the host based on the external PHYs Auto-Negotiation results.</p>	R/W Note 13.15	Note 13.16

Note 13.12 The default value of this field is determined by the BP_EN_strap_mii configuration strap. The strap value is loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the value, this register is updated with the new values. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

Note 13.13 The default value of this bit is determined by multiple strap settings. The strap values are loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the values, this register is updated with the new values. Refer to [Section 6.2.3, "Flow Control Enable Logic," on page 60](#) for additional information.

Note 13.14 The default value of this field is determined by the FD_FC_strap_mii configuration strap. The strap value is loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the value, this register is updated with the new values. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

Note 13.15 This bit is RO when in MAC mode.

Note 13.16 The default value of this field is determined by the manual_FC_strap_mii configuration strap. The strap value is loaded during reset and can be re-written by the EEPROM Loader. Once the EEPROM Loader re-writes the value, this register is updated with the new values. In MAC mode, this bit is not re-written by the EEPROM Loader and has a default value of "1". See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

13.1.5.4 Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA)

Offset: 1ACh Size: 32 bits

This read/write register is used in conjunction with the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) to perform read and write operations with the Switch Fabric CSR's. Refer to [Section 13.3, "Switch Fabric Control and Status Registers," on page 253](#) for details on the registers indirectly accessible via this register.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Switch CSR Data (CSR_DATA) This field contains the value read from or written to the Switch Fabric CSR. The Switch Fabric CSR is selected via the CSR Address (CSR_ADDR[15:0]) bits of the Switch Fabric CSR Interface Command Register (SWITCH_CSR_CMD).</p> <p>Upon a read, the value returned depends on the R/nW bit in the Switch Fabric CSR Interface Command Register (SWITCH_CSR_CMD). If R/nW is set, the data is from the switch fabric. If R/nW is cleared, the data is the value that was last written into this register.</p>	R/W	00000000h

Datasheet

13.1.5.5 Switch Fabric CSR Interface Command Register (SWITCH_CSR_CMD)

Offset: 1B0h Size: 32 bits

This read/write register is used in conjunction with the [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#) to control the read and write operations to the various Switch Fabric CSR's. Refer to [Section 13.3, "Switch Fabric Control and Status Registers," on page 253](#) for details on the registers indirectly accessible via this register.

BITS	DESCRIPTION	TYPE	DEFAULT
31	<p>CSR Busy (CSR_BUSY) When a 1 is written to this bit, the read or write operation (as determined by the R_nW bit) is performed to the specified Switch Fabric CSR in CSR Address (CSR_ADDR[15:0]). This bit will remain set until the operation is complete, at which time the bit will clear. In the case of a read, the clearing of this bit indicates to the Host that valid data can be read from the Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA). The SWITCH_CSR_CMD and SWITCH_CSR_DATA registers should not be modified until this bit is cleared.</p>	R/W SC	0b
30	<p>Read/Write (R_nW) This bit determines whether a read or write operation is performed by the Host to the specified Switch Engine CSR.</p> <p>0: Write 1: Read</p>	R/W	0b
29	<p>Auto Increment (AUTO_INC) This bit enables/disables the auto increment feature.</p> <p>When this bit is set, a write to the Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA) register will automatically set the CSR Busy (CSR_BUSY) bit. Once the write command is finished, the CSR Address (CSR_ADDR[15:0]) will automatically increment.</p> <p>When this bit is set, a read from the Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA) will automatically increment the CSR Address (CSR_ADDR[15:0]) and set the CSR Busy (CSR_BUSY) bit. This bit should be cleared by software before the last read from the SWITCH_CSR_DATA register.</p> <p>0: Disable Auto Increment 1: Enable Auto Increment</p> <p>Note: This bit has precedence over the Auto Decrement (AUTO_DEC) bit</p>	R/W	0b
28	<p>Auto Decrement (AUTO_DEC) This bit enables/disables the auto decrement feature.</p> <p>When this bit is set, a write to the Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA) will automatically set the CSR Busy (CSR_BUSY) bit. Once the write command is finished, the CSR Address (CSR_ADDR[15:0]) will automatically decrement.</p> <p>When this bit is set, a read from the Switch Fabric CSR Interface Data Register (SWITCH_CSR_DATA) will automatically decrement the CSR Address (CSR_ADDR[15:0]) and set the CSR Busy (CSR_BUSY) bit. This bit should be cleared by software before the last read from the SWITCH_CSR_DATA register.</p> <p>0: Disable Auto Decrement 1: Enable Auto Decrement</p>	R/W	0b
27:20	RESERVED	RO	-

BITS	DESCRIPTION	TYPE	DEFAULT
19:16	<p>CSR Byte Enable (CSR_BE[3:0]) This field is a 4-bit byte enable used for selection of valid bytes during write operations. Bytes which are not selected will not be written to the corresponding Switch Engine CSR.</p> <p>CSR_BE[3] corresponds to register data bits [31:24] CSR_BE[2] corresponds to register data bits [23:16] CSR_BE[1] corresponds to register data bits [15:8] CSR_BE[0] corresponds to register data bits [7:0]</p> <p>Typically all four byte enables should be set for auto increment and auto decrement operations.</p>	R/W	0h
15:0	<p>CSR Address (CSR_ADDR[15:0]) This field selects the 16-bit address of the Switch Fabric CSR that will be accessed with a read or write operation. Datasheet**13.1.5.6 Switch Fabric MAC Address High Register (SWITCH_MAC_ADDRH)**

Offset: 1F0h Size: 32 bits

This register contains the upper 16-bits of the MAC address used by the switch for Pause frames. This register is used in conjunction with [Switch Fabric MAC Address Low Register \(SWITCH_MAC_ADDRL\)](#). The contents of this register are optionally loaded from the EEPROM at power-on through the EEPROM Loader if a programmed EEPROM is detected. The least significant byte of this register (bits [7:0]) is loaded from address 05h of the EEPROM. The second byte (bits [15:8]) is loaded from address 06h of the EEPROM. The Host can update the contents of this field after the initialization process has completed.

Refer to [Section 13.1.5.7, "Switch Fabric MAC Address Low Register \(SWITCH_MAC_ADDRL\)"](#) for information on how this address is loaded by the EEPROM Loader. [Section 8.2.4, "EEPROM Loader," on page 113](#) contains additional details on using the EEPROM Loader.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:0	Physical Address[47:32] This field contains the upper 16-bits (47:32) of the physical address of the Switch Fabric MACs.	R/W	FFFFh

13.1.5.7 Switch Fabric MAC Address Low Register (SWITCH_MAC_ADDRL)

Offset: 1F4h Size: 32 bits

This register contains the lower 32-bits of the MAC address used by the switch for Pause frames. This register is used in conjunction with [Switch Fabric MAC Address High Register \(SWITCH_MAC_ADDRH\)](#). The contents of this register are optionally loaded from the EEPROM at power-on through the EEPROM Loader if a programmed EEPROM is detected. The least significant byte of this register (bits [7:0]) is loaded from address 01h of the EEPROM. The most significant byte (bits [31:24]) is loaded from address 04h of the EEPROM. The Host can update the contents of this field after the initialization process has completed.

Refer to [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for information on using the EEPROM Loader.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Physical Address[31:0] This field contains the lower 32-bits (31:0) of the physical address of the Switch Fabric MACs.	R/W	FF0F8000h

[Table 13.2](#) illustrates the byte ordering of the SWITCH_MAC_ADDRL and SWITCH_MAC_ADDRH registers with respect to the reception of the Ethernet physical address. Also shown is the correlation between the EEPROM addresses and the SWITCH_MAC_ADDRL and SWITCH_MAC_ADDRH registers.

Table 13.2 SWITCH_MAC_ADDRL, SWITCH_MAC_ADDRH, and EEPROM Byte Ordering

EEPROM Address	Register Location Written	Order of Reception on Ethernet
01h	SWITCH_MAC_ADDRL[7:0]	1 st
02h	SWITCH_MAC_ADDRL[15:8]	2 nd
03h	SWITCH_MAC_ADDRL[23:16]	3 rd
04h	SWITCH_MAC_ADDRL[31:24]	4 th
05h	SWITCH_MAC_ADDRH[7:0]	5 th
06h	SWITCH_MAC_ADDRH[15:8]	6 th

For example, if the desired Ethernet physical address is 12-34-56-78-9A-BC, the SWITCH_MAC_ADDRL and SWITCH_MAC_ADDRH registers would be programmed as shown in [Figure 13.2](#). The values required to automatically load this configuration from the EEPROM are also shown.

Figure 13.2 Example SWITCH_MAC_ADDRL, SWITCH_MAC_ADDRH, and EEPROM Setup

Note: By convention, the right nibble of the left most byte of the Ethernet address (in this example, the 2 of the 12h) is the most significant nibble and is transmitted/received first.

13.1.5.8 Switch Fabric CSR Interface Direct Data Register (SWITCH_CSR_DIRECT_DATA)

Offset: 200h - 2DCh Size: 32 bits

This write-only register set is used to perform directly addressed write operations to the Switch Fabric CSR's. Using this set of registers, writes can be directly addressed to select Switch Fabric registers, as specified in [Table 13.3](#).

Writes within the [Switch Fabric CSR Interface Direct Data Register \(SWITCH_CSR_DIRECT_DATA\)](#) address range automatically set the appropriate address, set the four byte enable bits, clear the R/nW bit and set the Busy bit in the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#). The completion of the write cycle is indicated when the Busy bit is cleared. The address that is set in the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) is mapped via [Table 13.3](#). For more information on this method of writing to the Switch Fabric CSR's, refer to [Section 6.2.3, "Flow Control Enable Logic,"](#) on page 60.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Switch CSR Data (CSR_DATA) This field contains the value to be written to the corresponding Switch Fabric register.	WO	00000000h

Note: This set of registers is for write operations only. Reads can be performed via the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#) and [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#) registers only.

Datasheet**13.1.6 PHY Management Interface (PMI)**

The PMI registers are used to indirectly access the PHY registers. Refer to [Section 13.2, "Ethernet PHY Control and Status Registers," on page 231](#) for additional information on the PHY registers. Refer to [Section 9.3, "PHY Management Interface \(PMI\)," on page 127](#) for information on the PMI.

Note: The Virtual PHY registers are *NOT* accessible via these registers.

13.1.6.1 PHY Management Interface Data Register (PMI_DATA)

Offset: 0A4h Size: 32 bits

This register is used in conjunction with the [PHY Management Interface Access Register \(PMI_ACCESS\)](#) to perform read and write operations to the PHYs.

Note: The Virtual PHY registers are *NOT* accessible via these registers.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:0	<p>MII Data This field contains the value read from or written to the PHYs. For a write operation, this register should be first written with the desired data. For a read operation, the PMI_ACCESS register is first written and once the command is finished, this register will contain the return data.</p> <p>Note: Upon a read, the value returned depends on the MII Write bit (MIIWnR) in the PHY Management Interface Access Register (PMI_ACCESS). If MIIWnR is 0, the data is from the PHY. If MIIWnR is 1, the data is the value that was last written into this register.</p>	R/W	00000000h

13.1.6.2 PHY Management Interface Access Register (PMI_ACCESS)

Offset: 0A8h Size: 32 bits

This register is used to control the management cycles to the PHYs. A PHY access is initiated when this register is written. This register is used in conjunction with the [PHY Management Interface Data Register \(PMI_DATA\)](#) to perform read and write operations to the PHYs.

Note: The Virtual PHY registers are *NOT* accessible via these registers.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:11	PHY Address (PHY_ADDR) These bits select the PHY device being accessed. Refer to Section 7.1.1, "PHY Addressing," on page 84 for information on PHY address assignments.	R/W	00000b
10:6	MII Register Index (MIIRINDA) These bits select the desired MII register in the PHY. Refer to Section 13.2, "Ethernet PHY Control and Status Registers," on page 231 for detailed descriptions on all PHY registers.	R/W	00000b
5:2	RESERVED	RO	-
1	MII Write (MIIWnR) Setting this bit informs the PHY that the access will be a write operation using the PHY Management Interface Data Register (PMI_DATA) . If this bit is cleared, the access will be a read operation, returning data into the PHY Management Interface Data Register (PMI_DATA) .	R/W	0b
0	MII Busy (MIIBZY) This bit must be read as 0 before writing to the PHY Management Interface Data Register (PMI_DATA) or PHY Management Interface Access Register (PMI_ACCESS) registers. This bit is automatically set when this register is written. During a PHY register access, this bit will be set, signifying a read or write access is in progress. This is a self-clearing (SC) bit that will return to 0 when the PHY register access has completed. During a PHY register write, the PHY Management Interface Data Register (PMI_DATA) must be kept valid until this bit is cleared. During a PHY register read, the PHY Management Interface Data Register (PMI_DATA) register is invalid until the MAC has cleared this bit.	RO SC	0b

Datasheet

13.1.7 Virtual PHY

This section details the Virtual PHY System CSR's. These registers provide status and control information similar to that of a real PHY while maintaining IEEE 802.3 compatibility. The Virtual PHY registers are addressable via the memory map, as described in [Table 13.1](#), as well as serially via the MII management protocol (IEEE 802.3 clause 22). When accessed serially, these registers are accessed through the MII management pins (in PHY modes only) via the MII serial management protocol specified in IEEE 802.3 clause 22. See [Section 2.3, "Modes of Operation," on page 23](#) for a detailed description of the various LAN9313/LAN9313i modes. When being accessed serially, the Virtual PHY will respond when the PHY address equals the address assigned by the phy_addr_sel_strap configuration strap, as defined in [Section 7.1.1, "PHY Addressing," on page 84](#). A list of all Virtual PHY register indexes for serial access can be seen in [Table 13.4](#). For more information on the Virtual PHY access modes, refer to [Section 13.2](#). For Virtual PHY functionality and operation information, see [Section 7.3, "Virtual PHY," on page 98](#).

Note: All Virtual PHY registers follow the IEEE 802.3 (clause 22.2.4) specified MII management register set. All functionality and bit definitions comply with these standards. The IEEE 802.3 specified register index (in decimal) is included under the LAN9313/LAN9313i memory mapped offset of each Virtual PHY register as a reference. For additional information, refer to the IEEE 802.3 Specification.

Note: When serially accessed, the Virtual PHY registers are only 16-bits wide, as is standard for MII management of PHY's.

Table 13.4 Virtual PHY MII Serially Addressable Register Index

INDEX #	SYMBOL	REGISTER NAME
0	VPHY_BASIC_CTRL	Virtual PHY Basic Control Register, Section 13.1.7.1
1	VPHY_BASIC_STATUS	Virtual PHY Basic Status Register, Section 13.1.7.2
2	VPHY_ID_MSB	Virtual PHY Identification MSB Register, Section 13.1.7.3
3	VPHY_ID_LSB	Virtual PHY Identification LSB Register, Section 13.1.7.4
4	VPHY_AN_ADV	Virtual PHY Auto-Negotiation Advertisement Register, Section 13.1.7.5
5	VPHY_AN_LP_BASE_ABILITY	Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register, Section 13.1.7.6
6	VPHY_AN_EXP	Virtual PHY Auto-Negotiation Expansion Register, Section 13.1.7.7
31	VPHY_SPEC_CTRL_STATUS	Virtual PHY Special Control/Status Register, Section 13.1.7.8

13.1.7.1 Virtual PHY Basic Control Register (VPHY_BASIC_CTRL)

Offset: 1C0h Size: 32 bits
 Index (decimal): 0

This read/write register is used to configure the Virtual PHY.

Note: This register is re-written in its entirety by the EEPROM Loader following the release or reset or a RELOAD command. Refer to [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.17)	RO	-
15	Reset (VPHY_RST) When set, this bit resets all the Virtual PHY registers to their default state. This bit is self clearing. 0: Normal Operation 1: Reset	R/W SC	0b
14	Loopback (VPHY_LOOPBACK) This bit enables/disables the loopback mode. When enabled, transmissions from the external MAC are not sent to the switch fabric. Instead, they are looped back onto the receive path. 0: Loopback mode disabled (normal operation) 1: Loopback mode enabled	R/W	0b
13	Speed Select LSB (VPHY_SPEED_SEL_LSB) This bit is used to set the speed of the Virtual PHY when the Auto-Negotiation (VPHY_AN) bit is disabled. 0: 10 Mbps 1: 100 Mbps	R/W	0b
12	Auto-Negotiation (VPHY_AN) This bit enables/disables Auto-Negotiation. When enabled, the Speed Select LSB (VPHY_SPEED_SEL_LSB) and Duplex Mode (VPHY_DUPLEX) bits are overridden. 0: Auto-Negotiation disabled 1: Auto-Negotiation enabled	R/W	1b
11	Power Down (VPHY_PWR_DWN) This bit is not used by the Virtual PHY and has no effect.	R/W	0b
10	Isolate (VPHY_ISO) This bit controls the MII input/output pins. When set and in PHY mode, the MII output pins are not driven, MII pull-ups and pull-downs are disabled and the input pins are ignored. When in MAC mode, this bit is ignored and has no effect. (Note 13.18) 0: Non-Isolated (Normal operation) 1: Isolated	R/W	0b
9	Restart Auto-Negotiation (VPHY_RST_AN) When set, this bit updates the emulated Auto-Negotiation results. 0: Normal operation 1: Auto-Negotiation restarted	R/W SC	0b

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
8	Duplex Mode (VPHY_DUPLEX) This bit is used to set the duplex when the Auto-Negotiation (VPHY_AN) bit is disabled. 0: Half Duplex 1: Full Duplex	R/W	0b
7	Collision Test (VPHY_COL_TEST) This bit enables/disables the collision test mode. When set, the collision signal to the external MAC is active during transmission from the external MAC. Note: It is recommended that this bit be used only when in loopback mode. 0: Collision test mode disabled 1: Collision test mode enabled	R/W	0b
6	Speed Select MSB (VPHY_SPEED_SEL_MSB) This bit is not used by the Virtual PHY and has no effect. The value returned is always 0.	RO	0b
5:0	RESERVED	RO	-

Note 13.17 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.18 The isolation does not apply to the MII management pins (MDIO).

13.1.7.2 Virtual PHY Basic Status Register (VPHY_BASIC_STATUS)

Offset: 1C4h Size: 32 bits
 Index (decimal): 1

This register is used to monitor the status of the Virtual PHY.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.19)	RO	-
15	100BASE-T4 This bit displays the status of 100BASE-T4 compatibility. 0: PHY not able to perform 100BASE-T4 1: PHY able to perform 100BASE-T4	RO	0b Note 13.20
14	100BASE-X Full Duplex This bit displays the status of 100BASE-X full duplex compatibility. 0: PHY not able to perform 100BASE-X full duplex 1: PHY able to perform 100BASE-X full duplex	RO	1b
13	100BASE-X Half Duplex This bit displays the status of 100BASE-X half duplex compatibility. 0: PHY not able to perform 100BASE-X half duplex 1: PHY able to perform 100BASE-X half duplex	RO	1b
12	10BASE-T Full Duplex This bit displays the status of 10BASE-T full duplex compatibility. 0: PHY not able to perform 10BASE-T full duplex 1: PHY able to perform 10BASE-T full duplex	RO	1b
11	10BASE-T Half Duplex This bit displays the status of 10BASE-T half duplex compatibility. 0: PHY not able to perform 10BASE-T half duplex 1: PHY able to perform 10BASE-T half duplex	RO	1b
10	100BASE-T2 Full Duplex This bit displays the status of 100BASE-T2 full duplex compatibility. 0: PHY not able to perform 100BASE-T2 full duplex 1: PHY able to perform 100BASE-T2 full duplex	RO	0b Note 13.20
9	100BASE-T2 Half Duplex This bit displays the status of 100BASE-T2 half duplex compatibility. 0: PHY not able to perform 100BASE-T2 half duplex 1: PHY able to perform 100BASE-T2 half duplex	RO	0b Note 13.20
8	Extended Status This bit displays whether extended status information is in register 15 (per IEEE 802.3 clause 22.2.4). 0: No extended status information in Register 15 1: Extended status information in Register 15	RO	0b Note 13.21
7	RESERVED	RO	-

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
6	MF Preamble Suppression This bit indicates whether the Virtual PHY accepts management frames with the preamble suppressed. 0: Management frames with preamble suppressed not accepted 1: Management frames with preamble suppressed accepted	RO	0b
5	Auto-Negotiation Complete This bit indicates the status of the Auto-Negotiation process. 0: Auto-Negotiation process not completed 1: Auto-Negotiation process completed	RO	1b Note 13.22
4	Remote Fault This bit indicates if a remote fault condition has been detected. 0: No remote fault condition detected 1: Remote fault condition detected	RO	0b Note 13.23
3	Auto-Negotiation Ability This bit indicates the status of the Virtual PHY's auto-negotiation. 0: Virtual PHY is unable to perform auto-negotiation 1: Virtual PHY is able to perform auto-negotiation	RO	1b
2	Link Status This bit indicates the status of the link. 0: Link is down 1: Link is up	RO	1b Note 13.23
1	Jabber Detect This bit indicates the status of the jabber condition. 0: No jabber condition detected 1: Jabber condition detected	RO	0b Note 13.23
0	Extended Capability This bit indicates whether extended register capability is supported. 0: Basic register set capabilities only 1: Extended register set capabilities	RO	1b Note 13.24

Note 13.19 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.20 The Virtual PHY supports 100BASE-X (half and full duplex) and 10BASE-T (half and full duplex) only. All other modes will always return as 0 (unable to perform).

Note 13.21 The Virtual PHY does not support Register 15 or 1000 Mb/s operation. Thus this bit is always returned as 0.

Note 13.22 The Auto-Negotiation Complete bit is first cleared on a reset, but set shortly after (when the Auto-Negotiation process is run). Refer to [Section 7.3.1, "Virtual PHY Auto-Negotiation," on page 98](#) for additional details.

Note 13.23 The Virtual PHY never has remote faults, its link is always up, and does not detect jabber.

Note 13.24 The Virtual PHY supports basic and some extended register capability. The Virtual PHY supports Registers 0-6 (per the IEEE 802.3 specification).

13.1.7.3 Virtual PHY Identification MSB Register (VPHY_ID_MSB)

Offset: 1C8h Size: 32 bits
 Index (decimal): 2

This read/write register contains the MSB of the Virtual PHY Organizationally Unique Identifier (OUI). The LSB of the Virtual PHY OUI is contained in the [Virtual PHY Identification LSB Register \(VPHY_ID_LSB\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.25)	RO	-
15:0	PHY ID This field contains the MSB of the Virtual PHY OUI (Note 13.26).	R/W	0000h

Note 13.25 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.26 IEEE allows a value of zero in each of the 32-bits of the PHY Identifier.

Datasheet**13.1.7.4 Virtual PHY Identification LSB Register (VPHY_ID_LSB)**

Offset: 1CCh Size: 32 bits
 Index (decimal): 3

This read/write register contains the LSB of the Virtual PHY Organizationally Unique Identifier (OUI). The MSB of the Virtual PHY OUI is contained in the [Virtual PHY Identification MSB Register \(VPHY_ID_MSB\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.27)	RO	-
15:10	PHY ID This field contains the lower 6-bits of the Virtual PHY OUI (Note 13.28).	R/W	00h
9:4	Model Number This field contains the 6-bit manufacturer's model number of the Virtual PHY (Note 13.28).	R/W	00h
3:0	Revision Number This field contain the 4-bit manufacturer's revision number of the Virtual PHY (Note 13.28).	R/W	0h

Note 13.27 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.28 IEEE allows a value of zero in each of the 32-bits of the PHY Identifier.

13.1.7.5 Virtual PHY Auto-Negotiation Advertisement Register (VPHY_AN_ADV)

Offset: 1D0h Size: 32 bits
 Index (decimal): 4

This read/write register contains the advertised ability of the Virtual PHY and is used in the Auto-Negotiation process with the link partner.

Note: This register is re-written in its entirety by the EEPROM Loader following the release or reset or a RELOAD command. Refer to [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.29)	RO	-
15	Next Page This bit determines the advertised next page capability and is always 0. 0: Virtual PHY does not advertise next page capability 1: Virtual PHY advertises next page capability	RO	0b Note 13.30
14	RESERVED	RO	-
13	Remote Fault This bit is not used since there is no physical link partner.	RO	0b Note 13.31
12	RESERVED	RO	-
11	Asymmetric Pause This bit determines the advertised asymmetric pause capability. 0: No Asymmetric PAUSE toward link partner advertised 1: Asymmetric PAUSE toward link partner advertised	R/W	0b
10	Pause This bit determines the advertised symmetric pause capability. 0: No Symmetric PAUSE toward link partner advertised 1: Symmetric PAUSE toward link partner advertised	R/W	Note 13.32
9	100BASE-T4 This bit determines the advertised 100BASE-T4 capability and is always 0. 0: 100BASE-T4 ability not advertised 1: 100BASE-T4 ability advertised	RO	0b Note 13.33
8	100BASE-X Full Duplex This bit determines the advertised 100BASE-X full duplex capability. 0: 100BASE-X full duplex ability not advertised 1: 100BASE-X full duplex ability advertised	R/W	1b
7	100BASE-X Half Duplex This bit determines the advertised 100BASE-X half duplex capability. 0: 100BASE-X half duplex ability not advertised 1: 100BASE-X half duplex ability advertised	R/W	1b
6	10BASE-T Full Duplex This bit determines the advertised 10BASE-T full duplex capability. 0: 10BASE-T full duplex ability not advertised 1: 10BASE-T full duplex ability advertised	R/W	1b

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
5	10BASE-T Half Duplex This bit determines the advertised 10BASE-T half duplex capability. 0: 10BASE-T half duplex ability not advertised 1: 10BASE-T half duplex ability advertised	R/W	1b
4:0	Selector Field This field identifies the type of message being sent by Auto-Negotiation. 00001: IEEE 802.3	R/W	00001b Note 13.34

Note 13.29 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.30 The Virtual PHY does not support next page capability. This bit value will always be 0.

Note 13.31 The Remote Fault bit is not useful since there is no actual link partner to send a fault to.

Note 13.32 The Pause bit defaults to 1 if the manual_FC_strap_mii strap is low, and 0 if the manual_FC_strap_mii strap is high. Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps,"](#) on [page 45](#).

Note 13.33 Virtual 100BASE-T4 is not supported.

Note 13.34 The Virtual PHY supports only IEEE 802.3. Only a value of 00001b should be used in this field.

13.1.7.6 Virtual PHY Auto-Negotiation Link Partner Base Page Ability Register (VPHY_AN_LP_BASE_ABILITY)

Offset: 1D4h Size: 32 bits
 Index (decimal): 5

This read-only register contains the advertised ability of the link partner's PHY and is used in the Auto-Negotiation process with the Virtual PHY. Because the Virtual PHY does not physically connect to an actual link partner, the values in this register are emulated as described below.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.35)	RO	-
15	Next Page This bit indicates the emulated link partner PHY next page capability and is always 0. 0: Link partner PHY does not advertise next page capability 1: Link partner PHY advertises next page capability	RO	0b Note 13.36
14	Acknowledge This bit indicates whether the link code word has been received from the partner and is always 1. 0: Link code word not yet received from partner 1: Link code word received from partner	RO	1b Note 13.36
13	Remote Fault Since there is no physical link partner, this bit is not used and is always returned as 0.	RO	0b Note 13.36
12	RESERVED	RO	-
11	Asymmetric Pause This bit indicates the emulated link partner PHY asymmetric pause capability. 0: No Asymmetric PAUSE toward link partner 1: Asymmetric PAUSE toward link partner	RO	Note 13.37
10	Pause This bit indicates the emulated link partner PHY symmetric pause capability. 0: No Symmetric PAUSE toward link partner 1: Symmetric PAUSE toward link partner	RO	Note 13.37
9	100BASE-T4 This bit indicates the emulated link partner PHY 100BASE-T4 capability. This bit is always 0. 0: 100BASE-T4 ability not supported 1: 100BASE-T4 ability supported	RO	0b Note 13.36
8	100BASE-X Full Duplex This bit indicates the emulated link partner PHY 100BASE-X full duplex capability. 0: 100BASE-X full duplex ability not supported 1: 100BASE-X full duplex ability supported	RO	Note 13.38

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
7	100BASE-X Half Duplex This bit indicates the emulated link partner PHY 100BASE-X half duplex capability. 0: 100BASE-X half duplex ability not supported 1: 100BASE-X half duplex ability supported	RO	Note 13.38
6	10BASE-T Full Duplex This bit indicates the emulated link partner PHY 10BASE-T full duplex capability. 0: 10BASE-T full duplex ability not supported 1: 10BASE-T full duplex ability supported	RO	Note 13.38
5	10BASE-T Half Duplex This bit indicates the emulated link partner PHY 10BASE-T half duplex capability. 0: 10BASE-T half duplex ability not supported 1: 10BASE-T half duplex ability supported	RO	Note 13.38
4:0	Selector Field This field identifies the type of message being sent by Auto-Negotiation. 00001: IEEE 802.3	RO	00001b

Note 13.35 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.36 The emulated link partner does not support next page, always instantly sends its link code word, never sends a fault, and does not support 100BASE-T4.

Note 13.37 The emulated link partner's asymmetric/symmetric pause ability is based upon the values of the [Asymmetric Pause](#) and [Pause](#) bits of the [Virtual PHY Auto-Negotiation Advertisement Register \(VPHY_AN_ADV\)](#). Thus the emulated link partner always accommodates the request of the Virtual PHY, as shown in [Table 13.5](#). See [Section 7.3.1, "Virtual PHY Auto-Negotiation," on page 98](#) for additional information.

Table 13.5 Emulated Link Partner Pause Flow Control Ability Default Values

	VPHY Symmetric Pause (register 4.10)	VPHY Asymmetric Pause (register 4.11)	Link Partner Symmetric Pause (register 5.10)	Link Partner Asymmetric Pause (register 5.11)
No Flow Control Enabled	0	0	0	0
Symmetric Pause	1	0	1	0
Asymmetric Pause Towards Switch	0	1	1	1
Asymmetric Pause Towards MAC	1	1	0	1

Note 13.38 The emulated link partner's ability is based on the MII_DUPLEX pin, duplex_pol_strap_mii, and speed_strap_mii, as well as on the Auto-Negotiation success. [Table 13.6](#) defines the default capabilities of the emulated link partner as a function of these signals. Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps," on page 45](#). For more information on the Virtual PHY auto-negotiation, see [Section 7.3.1, "Virtual PHY Auto-Negotiation," on page 98](#).

Table 13.6 Emulated Link Partner Default Advertised Ability

	<u>SPEED_MII</u>	Advertised Link Partner Ability (Bits 8,7,6,5)
<u>MII_DUPLEX = DUPLEX_POL_MII</u>	0	10BASE-T Full-Duplex (0010)
	1	100BASE-X Full-Duplex (1000)
<u>MII_DUPLEX != DUPLEX_POL_MII</u>	0	10BASE-T Half-Duplex (0001)
	1	100BASE-X Half-Duplex (0100)

Datasheet

13.1.7.7 Virtual PHY Auto-Negotiation Expansion Register (VPHY_AN_EXP)

Offset: 1D8h Size: 32 bits
 Index (decimal): 6

This register is used in the Auto-Negotiation process.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED (See Note 13.39)	RO	-
15:5	RESERVED	RO	-
4	Parallel Detection Fault This bit indicates whether a Parallel Detection Fault has been detected. This bit is always 0. 0: A fault hasn't been detected via the Parallel Detection function 1: A fault has been detected via the Parallel Detection function	RO	0b Note 13.40
3	Link Partner Next Page Able This bit indicates whether the link partner has next page ability. This bit is always 0. 0: Link partner does not contain next page capability 1: Link partner contains next page capability	RO	0b Note 13.41
2	Local Device Next Page Able This bit indicates whether the local device has next page ability. This bit is always 0. 0: Local device does not contain next page capability 1: Local device contains next page capability	RO	0b Note 13.41
1	Page Received This bit indicates the reception of a new page. 0: A new page has not been received 1: A new page has been received	RO/LH	1b Note 13.42
0	Link Partner Auto-Negotiation Able This bit indicates the Auto-negotiation ability of the link partner. 0: Link partner is not Auto-Negotiation able 1: Link partner is Auto-Negotiation able	RO	1b Note 13.43

Note 13.39 The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.

Note 13.40 Since the Virtual PHY link partner is emulated, there is never a Parallel Detection Fault and this bit is always 0.

Note 13.41 Next page ability is not supported by the Virtual PHY or emulated link partner.

Note 13.42 The page received bit is clear when read. It is first cleared on reset, but set shortly thereafter when the Auto-Negotiation process is run.

Note 13.43 The emulated link partner will show Auto-Negotiation able unless Auto-Negotiation fails (no common bits between the advertised ability and the link partner ability).

13.1.7.8 Virtual PHY Special Control/Status Register (VPHY_SPECIAL_CONTROL_STATUS)

Offset: 1DCh Size: 32 bits
 Index (decimal): 31

This read/write register contains a current link speed/duplex indicator and SQE control.

Datasheet

- Note 13.44** The reserved bits 31-16 are used to pad the register to 32-bits so that each register is on a DWORD boundary. When accessed serially (through the MII management protocol), the register is 16-bits wide.
- Note 13.45** The default value of this field is the result of the Auto-Negotiation process if the [Auto-Negotiation \(VPHY_AN\)](#) bit of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) is set. Otherwise, this field reflects the [Speed Select LSB \(VPHY_SPEED_SEL_LSB\)](#) and [Duplex Mode \(VPHY_DUPLEX\)](#) bit settings of the VPHY_BASIC_CTRL register. Refer to [Section 7.3.1, "Virtual PHY Auto-Negotiation,"](#) on [page 98](#) for information on the Auto-Negotiation determination process of the Virtual PHY.
- Note 13.46** Register bits designated as NASR are reset when the Virtual PHY Reset is generated via the [Reset Control Register \(RESET_CTL\)](#). The NASR designation is only applicable when the [Reset \(VPHY_RST\)](#) bit of the [Virtual PHY Basic Control Register \(VPHY_BASIC_CTRL\)](#) is set.
- Note 13.47** The default value of this field is determined via the `SQE_test_disable_strap_mii` configuration strap. Refer to [Section 4.2.4, "Configuration Straps,"](#) on [page 45](#) for additional information.

13.1.8 Miscellaneous

This section details the remainder of the System CSR's. These registers allow for monitoring and configuration of various LAN9313/LAN9313i functions such as the Chip ID/revision, byte order testing, hardware configuration, general purpose timer, and free running counter.

13.1.8.1 Chip ID and Revision (ID_REV)

Offset: 050h Size: 32 bits

This read-only register contains the ID and Revision fields for the LAN9313/LAN9313i.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	Chip ID This field indicates the chip ID.	RO	9313h
15:0	Chip Revision This field indicates the design revision.	RO	Note 13.48

Note 13.48 Default value is dependent on device revision.

Datasheet**13.1.8.2 Byte Order Test Register (BYTE_TEST)**

Offset: 064h Size: 32 bits

This read-only register can be used to determine the byte ordering of the current configuration.

Note: This register can be read while the LAN9313/LAN9313i is in the not ready state. This register can also be polled while the device is in the reset state without causing any damaging effects. The returned data will be invalid since the serial interfaces are also in the reset state at this time. However, the returned data will not match the normal valid data pattern during reset.

Note: In SMI mode, either half of this register can be read without the need to read the other half.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Byte Test (BYTE_TEST) This field reflects the current byte ordering	RO	87654321h

13.1.8.3 Hardware Configuration Register (HW_CFG)

Offset: 074h Size: 32 bits

This register allows the configuration of various hardware features.

Note: This register can be polled while the LAN9313/LAN9313i is in the reset or not ready state (READY bit is cleared). Returned data will be invalid during the reset state since the serial interfaces are also in reset at this time.

Note: In SMI mode, either half of this register can be read without the need to read the other half.

BITS	DESCRIPTION	TYPE	DEFAULT
31:28	RESERVED	RO	-
27	<p>Device Ready (READY) When set, this bit indicates that the LAN9313/LAN9313i is ready to be accessed. Upon power-up, nRST reset, or digital reset, the host processor may interrogate this field as an indication that the LAN9313/LAN9313i has stabilized and is fully active.</p> <p>This bit can cause an interrupt if enabled.</p> <p>Note: With the exception of the HW_CFG, BYTE_TEST, and RESET_CTL registers, read access to any internal resources is forbidden while the READY bit is cleared. Writes to any address are invalid until this bit is set.</p>	RO	0b
26	<p>AMDIX_EN Strap State Port 2 This bit reflects the state of the auto_mdix_strap_2 strap that connects to the PHY. The strap value is loaded with the level of the auto_mdix_strap_2 during reset and can be re-written by the EEPROM Loader. The strap value can be overridden by bit 15 and 13 of the Port 2 PHY Special Control/Status Indication Register (Section 13.2.2.10).</p>	RO	Note 13.49
25	<p>AMDIX_EN Strap State Port 1 This bit reflects the state of the auto_mdix_strap_1 strap that connects to the PHY. The strap value is loaded with the level of the auto_mdix_strap_1 during reset and can be re-written by the EEPROM Loader. The strap value can be overridden by bit 15 and 13 of the Port 1 PHY Special Control/Status Indication Register (Section 13.2.2.10).</p>	RO	Note 13.50
24:0	RESERVED	RO	-

Note 13.49 The default value of this field is determined by the configuration strap auto_mdix_strap_2. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

Note 13.50 The default value of this field is determined by the configuration strap auto_mdix_strap_1. See [Section 4.2.4, "Configuration Straps," on page 45](#) for more information.

Datasheet**13.1.8.4 General Purpose Timer Configuration Register (GPT_CFG)**

Offset: 08Ch Size: 32 bits

This read/write register configures the LAN9313/LAN9313i General Purpose Timer (GPT). The GPT can be configured to generate host interrupts at the interval defined in this register. The current value of the GPT can be monitored via the [General Purpose Timer Count Register \(GPT_CNT\)](#). Refer to [Section 11.1, "General Purpose Timer," on page 141](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:30	RESERVED	RO	-
29	General Purpose Timer Enable (TIMER_EN) This bit enables the GPT. When set, the GPT enters the run state. When cleared, the GPT is halted. On the 1 to 0 transition of this bit, the GPT_LOAD field of this register will be preset to FFFFh. 0: GPT Disabled 1: GPT Enabled	R/W	0b
28:16	RESERVED	RO	-
15:0	General Purpose Timer Pre-Load (GPT_LOAD) This value is pre-loaded into the GPT. This is the starting value of the GPT. The timer will begin decrementing from this value when enabled.	R/W	FFFFh

13.1.8.5 General Purpose Timer Count Register (GPT_CNT)

Offset: 090h Size: 32 bits

This read-only register reflects the current general purpose timer (GPT) value. The register should be used in conjunction with the [General Purpose Timer Configuration Register \(GPT_CFG\)](#) to configure and monitor the GPT. Refer to [Section 11.1, "General Purpose Timer," on page 141](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:0	General Purpose Timer Current Count (GPT_CNT) This 16-bit field represents the current value of the GPT.	RO	FFFFh

Datasheet**13.1.8.6 Free Running 25MHz Counter Register (FREE_RUN)**

Offset: 09Ch Size: 32 bits

This read-only register reflects the current value of the free-running 25MHz counter. Refer to [Section 11.2, "Free-Running Clock," on page 141](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Free Running Counter (FR_CNT) This field reflects the current value of the free-running 32-bit counter. At reset, the counter starts at zero and is incremented by one every 25MHz cycle. When the maximum count has been reached, the counter will rollover to zero and continue counting.</p> <p>Note: The free running counter can take up to 160nS to clear after a reset event.</p>	RO	00000000h

13.1.8.7 Reset Control Register (RESET_CTL)

Offset: 1F8h Size: 32 bits

This register contains software controlled resets.

Note: This register can be read while the LAN9313/LAN9313i is in the not ready state. This register can also be polled while the device is in the reset state without causing any damaging effects. However, the returned data will be invalid since the serial interfaces are also in the reset state at this time.

Note: In SMI mode, either half of this register can be read without the need to read the other half.

BITS	DESCRIPTION	TYPE	DEFAULT
31:4	RESERVED	RO	-
3	Virtual PHY Reset (VPHY_RST) Setting this bit resets the Virtual PHY. When the Virtual PHY is released from reset, this bit is automatically cleared. All writes to this bit are ignored while this bit is set. Note: This bit is not accessible via the EEPROM Loader.	R/W SC	0b
2	Port 2 PHY Reset (PHY2_RST) Setting this bit resets the Port 2 PHY. The internal logic automatically holds the PHY reset for a minimum of 102uS. When the Port 2 PHY is released from reset, this bit is automatically cleared. All writes to this bit are ignored while this bit is set. Note: This bit is not accessible via the EEPROM Loader.	R/W SC	0b
1	Port 1 PHY Reset (PHY1_RST) Setting this bit resets the Port 1 PHY. The internal logic automatically holds the PHY reset for a minimum of 102uS. When the Port 1 PHY is released from reset, this bit is automatically cleared. All writes to this bit are ignored while this bit is set. Note: This bit is not accessible via the EEPROM Loader.	R/W SC	0b
0	Digital Reset (DIGITAL_RST) Setting this bit resets the complete chip except the PLL, Virtual PHY, Port 1 PHY, and Port 2 PHY. The EEPROM Loader will automatically reload the configuration following this reset, but will not reset the Virtual PHY, Port 1 PHY, or Port 2 PHY. If desired, the above PHY resets can be issued once the device is configured. All system CSRs are reset except for any NASR type bits. Any in progress EEPROM commands (including RELOAD) are terminated. When the chip is released from reset, this bit is automatically cleared. The BYTE_TEST register should be polled to determine when the reset is complete. All writes to this bit are ignored while this bit is set. Note: This bit is not accessible via the EEPROM Loader.	R/W SC	0b

13.2 Ethernet PHY Control and Status Registers

This section details the various LAN9313/LAN9313i Ethernet PHY control and status registers. The LAN9313/LAN9313i contains three PHY's: Port 1 PHY, Port 2 PHY and a Virtual PHY. All PHY registers follow the IEEE 802.3 (clause 22.2.4) specified MII management register set. All functionality and bit definitions comply with these standards. The IEEE 802.3 specified register index (in decimal) is included with each register definition, allowing for addressing of these registers via the MII serial management protocol. For additional information on the MII management protocol, refer to the IEEE 802.3 Specification.

Each individual PHY is assigned a unique PHY address as detailed in [Section 7.1.1, "PHY Addressing,"](#) on page 84.

13.2.1 Virtual PHY Registers

The Virtual PHY provides a basic MII management interface for communication with an standard external MAC as if it was attached to a single port PHY. The Virtual PHY registers differ from the Port 1 & 2 PHY registers in that they are addressable via the memory map, as described in [Table 13.1](#), as well as serially. These modes of access are described in [Section 13.1.7, "Virtual PHY,"](#) on page 209.

Because the Virtual PHY registers are also memory mapped, their definitions have been included in the [System Control and Status Registers Section 13.1.7, "Virtual PHY,"](#) on page 209. A list of the Virtual PHY MII addressable registers and their corresponding register index numbers is also included in [Table 13.4](#).

Note: When serially accessed, the Virtual PHY registers are only 16-bits wide, as is standard for MII management of PHY's.

13.2.2 Port 1 & 2 PHY Registers

The Port 1 and Port 2 PHY's are comparable in functionality and have an identical set of non-memory mapped registers. The Port 1 and Port 2 PHY registers are not memory mapped. These registers are indirectly accessed through the [PHY Management Interface Access Register \(PMI_ACCESS\)](#) and [PHY Management Interface Data Register \(PMI_DATA\)](#) registers (in MAC or PHY I²C and SPI managed modes only) or through the MII management pins (in MAC or PHY SMI managed modes only) via the MII serial management protocol specified in IEEE 802.3 clause 22. See [Section 2.3, "Modes of Operation,"](#) on page 23 for a details on the various LAN9313/LAN9313i modes. Because the Port 1 & 2 PHY registers are functionally identical, their register descriptions have been consolidated. A lowercase "x" has been appended to the end of each PHY register name in this section, where "x" should be replaced with "1" or "2" for the Port 1 PHY or the Port 2 PHY registers respectively. A list of the Port 1 & 2 PHY MII addressable registers and their corresponding register index numbers is included in [Table 13.7](#). Each individual PHY is assigned a unique PHY address as detailed in [Section 7.1.1, "PHY Addressing,"](#) on page 84.

Table 13.7 Port 1 & 2 PHY MII Serially Addressable Registers

INDEX #	SYMBOL	REGISTER NAME
0	PHY_BASIC_CONTROL_x	Port x PHY Basic Control Register, Section 13.2.2.1
1	PHY_BASIC_STATUS_x	Port x PHY Basic Status Register, Section 13.2.2.2
2	PHY_ID_MSB_x	Port x PHY Identification MSB Register, Section 13.2.2.3
3	PHY_ID_LSB_x	Port x PHY Identification LSB Register, Section 13.2.2.4
4	PHY_AN_ADV_x	Port x PHY Auto-Negotiation Advertisement Register, Section 13.2.2.5

Datasheet

13.2.2.1 Port x PHY Basic Control Register (PHY_BASIC_CONTROL_x)

Index (decimal): 0

Size: 16 bits

This read/write register is used to configure the Port x PHY.

Note: This register is re-written in its entirety by the EEPROM Loader following the release of reset or a RELOAD command. Refer to [Section 8.2.4, "EEPROM Loader," on page 113](#) for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
15	Reset (PHY_RST) When set, this bit resets all the Port x PHY registers to their default state, except those marked as NASR type. This bit is self clearing. 0: Normal operation 1: Reset	R/W SC	0b
14	Loopback (PHY_LOOPBACK) This bit enables/disables the loopback mode. When enabled, transmissions from the switch fabric are not sent to network. Instead, they are looped back into the switch fabric. Note: If loopback is enabled during half-duplex operation, then the Enable Receive Own Transmit bit in the Port x MAC Receive Configuration Register (MAC_RX_CFG_x) must be set for the specified port. Otherwise, the switch fabric will ignore receive activity when transmitting in half-duplex mode. 0: Loopback mode disabled (normal operation) 1: Loopback mode enabled	R/W	0b
13	Speed Select LSB (PHY_SPEED_SEL_LSB) This bit is used to set the speed of the Port x PHY when the Auto-Negotiation (PHY_AN) bit is disabled. 0: 10 Mbps 1: 100 Mbps	R/W	Note 13.51
12	Auto-Negotiation (PHY_AN) This bit enables/disables Auto-Negotiation. When enabled, the Speed Select LSB (PHY_SPEED_SEL_LSB) and Duplex Mode (PHY_DUPLEX) bits are overridden. 0: Auto-Negotiation disabled 1: Auto-Negotiation enabled	R/W	Note 13.52
11	Power Down (PHY_PWR_DWN) This bit controls the power down mode of the Port x PHY. After this bit is cleared the PHY may auto-negotiate with its partner station. This process can take up to a few seconds to complete. Once Auto-Negotiation is complete, bit 5 (Auto-Negotiation Complete) of the Port x PHY Basic Status Register (PHY_BASIC_STATUS_x) will be set. Note: The PHY_AN bit of this register must be cleared before setting this bit. 0: Normal operation 1: General power down mode	R/W	0b
10	RESERVED	RO	-

BITS	DESCRIPTION	TYPE	DEFAULT
9	Restart Auto-Negotiation (PHY_RST_AN) When set, this bit restarts the Auto-Negotiation process. 0: Normal operation 1: Auto-Negotiation restarted	R/W SC	0b
8	Duplex Mode (PHY_DUPLEX) This bit is used to set the duplex when the Auto-Negotiation (PHY_AN) bit is disabled. 0: Half Duplex 1: Full Duplex	R/W	Note 13.53
7	Collision Test Mode (PHY_COL_TEST) This bit enables/disables the collision test mode of the Port x PHY. When set, the collision signal is active during transmission. It is recommended that this feature be used only in loopback mode. 0: Collision test mode disabled 1: Collision test mode enabled	R/W	0b
6:0	RESERVED	RO	-

Note 13.51 The default value of this bit is determined by the logical OR of the Auto-Negotiation strap (autoneg_strap_1 for Port 1 PHY, autoneg_strap_2 for Port 2 PHY) and the speed select strap (speed_strap_1 for Port 1 PHY, speed_strap_2 for Port 2 PHY). Essentially, if the Auto-Negotiation strap is set, the default value is 1, otherwise the default is determined by the value of the speed select strap. Refer to [Section 4.2.4, "Configuration Straps,"](#) on [page 45](#) for more information.

Note 13.52 The default value of this bit is determined by the value of the Auto-Negotiation strap (autoneg_strap_1 for Port 1 PHY, autoneg_strap_2 for Port 2 PHY). Refer to [Section 4.2.4, "Configuration Straps,"](#) on [page 45](#) for more information.

Note 13.53 The default value of this bit is determined by the logical AND of the negation of the Auto-Negotiation strap (autoneg_strap_1 for Port 1 PHY, autoneg_strap_2 for Port 2 PHY) and the duplex select strap (duplex_strap_1 for Port 1 PHY, duplex_strap_2 for Port 2 PHY). Essentially, if the Auto-Negotiation strap is set, the default value is 0, otherwise the default is determined by the value of the duplex select strap. Refer to [Section 4.2.4, "Configuration Straps,"](#) on [page 45](#) for more information.

Datasheet

13.2.2.2 Port x PHY Basic Status Register (PHY_BASIC_STATUS_x)

Index (decimal): 1

Size: 16 bits

This register is used to monitor the status of the Port x PHY.

BITS	DESCRIPTION	TYPE	DEFAULT
15	100BASE-T4 This bit displays the status of 100BASE-T4 compatibility. 0: PHY not able to perform 100BASE-T4 1: PHY able to perform 100BASE-T4	RO	0b Note 13.54
14	100BASE-X Full Duplex This bit displays the status of 100BASE-X full duplex compatibility. 0: PHY not able to perform 100BASE-X full duplex 1: PHY able to perform 100BASE-X full duplex	RO	1b
13	100BASE-X Half Duplex This bit displays the status of 100BASE-X half duplex compatibility. 0: PHY not able to perform 100BASE-X half duplex 1: PHY able to perform 100BASE-X half duplex	RO	1b
12	10BASE-T Full Duplex This bit displays the status of 10BASE-T full duplex compatibility. 0: PHY not able to perform 10BASE-T full duplex 1: PHY able to perform 10BASE-T full duplex	RO	1b
11	10BASE-T Half Duplex This bit displays the status of 10BASE-T half duplex compatibility. 0: PHY not able to perform 10BASE-T half duplex 1: PHY able to perform 10BASE-T half duplex	RO	1b
10	100BASE-T2 Full Duplex This bit displays the status of 100BASE-T2 full duplex compatibility. 0: PHY not able to perform 100BASE-T2 full duplex 1: PHY able to perform 100BASE-T2 full duplex	RO	0b Note 13.54
9	100BASE-T2 Half Duplex This bit displays the status of 100BASE-T2 half duplex compatibility. 0: PHY not able to perform 100BASE-T2 half duplex 1: PHY able to perform 100BASE-T2 half duplex	RO	0b Note 13.54
8:6	RESERVED	RO	-
5	Auto-Negotiation Complete This bit indicates the status of the Auto-Negotiation process. 0: Auto-Negotiation process not completed 1: Auto-Negotiation process completed	RO	0b
4	Remote Fault This bit indicates if a remote fault condition has been detected. 0: No remote fault condition detected 1: Remote fault condition detected	RO/LH	0b

BITS	DESCRIPTION	TYPE	DEFAULT
3	Auto-Negotiation Ability This bit indicates the status of the PHY's auto-negotiation. 0: PHY is unable to perform auto-negotiation 1: PHY is able to perform auto-negotiation	RO	1b
2	Link Status This bit indicates the status of the link. 0: Link is down 1: Link is up	RO/LL	0b
1	Jabber Detect This bit indicates the status of the jabber condition. 0: No jabber condition detected 1: Jabber condition detected	RO/LH	0b
0	Extended Capability This bit indicates whether extended register capability is supported. 0: Basic register set capabilities only 1: Extended register set capabilities	RO	1b

Note 13.54 The PHY supports 100BASE-TX (half and full duplex) and 10BASE-T (half and full duplex) only. All other modes will always return as 0 (unable to perform).

Datasheet**13.2.2.3 Port x PHY Identification MSB Register (PHY_ID_MSB_x)**

Index (decimal): 2

Size: 16 bits

This read/write register contains the MSB of the Organizationally Unique Identifier (OUI) for the Port x PHY. The LSB of the PHY OUI is contained in the [Port x PHY Identification LSB Register \(PHY_ID_LSB_x\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
15:0	PHY ID This field is assigned to the 3rd through 18th bits of the OUI, respectively (OUI = 00800Fh).	R/W	0007h

13.2.2.4 Port x PHY Identification LSB Register (PHY_ID_LSB_x)

Index (decimal): 3 Size: 16 bits

This read/write register contains the LSB of the Organizationally Unique Identifier (OUI) for the Port x PHY. The MSB of the PHY OUI is contained in the [Port x PHY Identification MSB Register \(PHY_ID_MSB_x\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
15:10	PHY ID This field is assigned to the 19th through 24th bits of the PHY OUI, respectively. (OUI = 00800Fh).	R/W	30h
9:4	Model Number This field contains the 6-bit manufacturer's model number of the PHY.	R/W	0Dh
3:0	Revision Number This field contain the 4-bit manufacturer's revision number of the PHY.	R/W	1h

Datasheet

13.2.2.5 Port x PHY Auto-Negotiation Advertisement Register (PHY_AN_ADV_x)

Index (decimal): 4

Size: 16 bits

This read/write register contains the advertised ability of the Port x PHY and is used in the Auto-Negotiation process with the link partner.

Note: This register is re-written by the EEPROM Loader following the release of reset or a RELOAD command. Refer to [Section 8.2.4, "EEPROM Loader,"](#) on page 113 for additional information.

BITS	DESCRIPTION	TYPE	DEFAULT
15	Next Page This bit determines the advertised next page capability. The LAN9313/LAN9313i is not next page capable. Therefore, this bit must always be 0. 0: PHY does not advertise next page capability 1: PHY advertises next page capability	R/W	0b
14	RESERVED	RO	-
13	Remote Fault This bit determines if remote fault indication will be advertised to the link partner. 0: Remote fault indication not advertised 1: Remote fault indication advertised	R/W	0b
12	RESERVED Note: This bit should be written as 0.	R/W	0b
11	Asymmetric Pause This bit determines the advertised asymmetric pause capability. 0: No Asymmetric PAUSE toward link partner advertised 1: Asymmetric PAUSE toward link partner advertised	R/W	0b Note 13.55
10	Symmetric Pause This bit determines the advertised symmetric pause capability. 0: No Symmetric PAUSE toward link partner advertised 1: Symmetric PAUSE toward link partner advertised	R/W	Note 13.55 Note 13.56
9	100BASE-T4 This bit determines the advertised 100BASE-T4 capability. The LAN9313/LAN9313i does not support T4 capability. Therefore, this bit must always be 0. 0: 100BASE-T4 ability not advertised 1: 100BASE-T4 ability advertised	R/W	0b
8	100BASE-X Full Duplex This bit determines the advertised 100BASE-X full duplex capability. 0: 100BASE-X full duplex ability not advertised 1: 100BASE-X full duplex ability advertised	R/W	1b
7	100BASE-X Half Duplex This bit determines the advertised 100BASE-X half duplex capability. 0: 100BASE-X half duplex ability not advertised 1: 100BASE-X half duplex ability advertised	R/W	1b

BITS	DESCRIPTION	TYPE	DEFAULT
6	10BASE-T Full Duplex This bit determines the advertised 10BASE-T full duplex capability. 0: 10BASE-T full duplex ability not advertised 1: 10BASE-T full duplex ability advertised	R/W	Note 13.57 Table 13.8
5	10BASE-T Half Duplex This bit determines the advertised 10BASE-T half duplex capability. 0: 10BASE-T half duplex ability not advertised 1: 10BASE-T half duplex ability advertised	R/W	Note 13.58 Table 13.9
4:0	Selector Field This field identifies the type of message being sent by Auto-Negotiation. 00001: IEEE 802.3	R/W	00001b

Note 13.55 The Pause and Asymmetric Pause bits are loaded into the PHY registers by the EEPROM Loader.

Note 13.56 The default value of this bit is determined by the Manual Flow Control Enable Strap (manual_FC_strap_x). When the Manual Flow Control Enable Strap is 0, this bit defaults to 1 (symmetric pause advertised). When the Manual Flow Control Enable Strap is 1, this bit defaults to 0 (symmetric pause not advertised). Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps," on page 45](#). Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for configuration strap definitions.

Note 13.57 The default value of this bit is determined by the logical OR of the Auto-Negotiation strap (autoneg_strap_x) with the logical AND of the negated speed select strap (speed_strap_x) and (duplex_strap_x). [Table 13.8](#) defines the default behavior of this bit. Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps," on page 45](#). Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for configuration strap definitions.

Table 13.8 10BASE-T Full Duplex Advertisement Default Value

autoneg_strap_x	speed_strap_x	duplex_strap_x	Default 10BASE-T Full Duplex (Bit 6) Value
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	0
1	0	0	1
1	0	1	1
1	1	0	1
1	1	1	1

Note 13.58 The default value of this bit is determined by the logical OR of the Auto-Negotiation strap (autoneg_strap_x) and the negated speed strap (speed_strap_x). [Table 13.9](#) defines the default behavior of this bit. Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps," on page 45](#). Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for configuration strap definitions.

Table 13.9 10BASE-T Half Duplex Advertisement Bit Default Value

autoneg_strap_x	speed_strap_x	Default 10BASE-T Half Duplex (Bit 5) Value
0	0	1
0	1	0
1	0	1
1	1	1

**13.2.2.6 Port x PHY Auto-Negotiation Link Partner Base Page Ability Register
(PHY_AN_LP_BASE_ABILITY_x)**

Index (decimal): 5 Size: 16 bits

This read-only register contains the advertised ability of the link partner's PHY and is used in the Auto-Negotiation process between the link partner and the Port x PHY.

BITS	DESCRIPTION	TYPE	DEFAULT
15	Next Page This bit indicates the link partner PHY page capability. 0: Link partner PHY does not advertise next page capability 1: Link partner PHY advertises next page capability	RO	0b
14	Acknowledge This bit indicates whether the link code word has been received from the partner. 0: Link code word not yet received from partner 1: Link code word received from partner	RO	0b
13	Remote Fault This bit indicates whether a remote fault has been detected. 0: No remote fault 1: Remote fault detected	RO	0b
12	RESERVED	RO	-
11	Asymmetric Pause This bit indicates the link partner PHY asymmetric pause capability. 0: No Asymmetric PAUSE toward link partner 1: Asymmetric PAUSE toward link partner	RO	0b
10	Pause This bit indicates the link partner PHY symmetric pause capability. 0: No Symmetric PAUSE toward link partner 1: Symmetric PAUSE toward link partner	RO	0b
9	100BASE-T4 This bit indicates the link partner PHY 100BASE-T4 capability. 0: 100BASE-T4 ability not supported 1: 100BASE-T4 ability supported	RO	0b
8	100BASE-X Full Duplex This bit indicates the link partner PHY 100BASE-X full duplex capability. 0: 100BASE-X full duplex ability not supported 1: 100BASE-X full duplex ability supported	RO	0b
7	100BASE-X Half Duplex This bit indicates the link partner PHY 100BASE-X half duplex capability. 0: 100BASE-X half duplex ability not supported 1: 100BASE-X half duplex ability supported	RO	0b

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT
6	10BASE-T Full Duplex This bit indicates the link partner PHY 10BASE-T full duplex capability. 0: 10BASE-T full duplex ability not supported 1: 10BASE-T full duplex ability supported	RO	0b
5	10BASE-T Half Duplex This bit indicates the link partner PHY 10BASE-T half duplex capability. 0: 10BASE-T half duplex ability not supported 1: 10BASE-T half duplex ability supported	RO	0b
4:0	Selector Field This field identifies the type of message being sent by Auto-Negotiation. 00001: IEEE 802.3	RO	00001b Note 13.59

Note 13.59 The Port 1 & 2 PHY's support only IEEE 802.3.

13.2.2.7 Port x PHY Auto-Negotiation Expansion Register (PHY_AN_EXP_x)

Index (decimal): 6

Size: 16 bits

This read/write register is used in the Auto-Negotiation process between the link partner and the Port x PHY.

BITS	DESCRIPTION	TYPE	DEFAULT
15:5	RESERVED	RO	-
4	Parallel Detection Fault This bit indicates whether a Parallel Detection Fault has been detected. 0: A fault hasn't been detected via the Parallel Detection function 1: A fault has been detected via the Parallel Detection function	RO/LH	0b
3	Link Partner Next Page Able This bit indicates whether the link partner has next page ability. 0: Link partner does not contain next page capability 1: Link partner contains next page capability	RO	0b
2	Local Device Next Page Able This bit indicates whether the local device has next page ability. 0: Local device does not contain next page capability 1: Local device contains next page capability	RO	0b
1	Page Received This bit indicates the reception of a new page. 0: A new page has not been received 1: A new page has been received	RO/LH	0b
0	Link Partner Auto-Negotiation Able This bit indicates the Auto-negotiation ability of the link partner. 0: Link partner is not Auto-Negotiation able 1: Link partner is Auto-Negotiation able	RO	0b

Datasheet**13.2.2.8 Port x PHY Mode Control/Status Register (PHY_MODE_CONTROL_STATUS_x)**

Index (decimal): 17

Size: 16 bits

This read/write register is used to control and monitor various Port x PHY configuration options.

BITS	DESCRIPTION	TYPE	DEFAULT
15:14	RESERVED	RO	-
13	Energy Detect Power-Down (EDPWRDOWN) This bit controls the Energy Detect Power-Down mode. 0: Energy Detect Power-Down is disabled 1: Energy Detect Power-Down is enabled	R/W	0b
12:2	RESERVED	RO	-
1	Energy On (ENERGYON) This bit indicates whether energy is detected on the line. It is cleared if no valid energy is detected within 256ms. This bit is unaffected by a software reset and is reset to 1 by a hardware reset. 0: No valid energy detected on the line 1: Energy detected on the line	RO	1b
0	RESERVED	R/W	0b

13.2.2.9 Port x PHY Special Modes Register (PHY_SPECIAL_MODES_x)

Index (decimal): 18 Size: 16 bits

This read/write register is used to control the special modes of the Port x PHY.

Note: This register is re-written by the EEPROM Loader following the release of reset or a RELOAD command. Refer to [Section 8.2.4, "EEPROM Loader," on page 113](#) for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
15:8	RESERVED	RO	-
7:5	PHY Mode (MODE[2:0]) This field controls the PHY mode of operation. Refer to Table 13.10 for a definition of each mode.	R/W NASR Note 13.60	Note 13.61
4:0	PHY Address (PHYADD) The PHY Address field determines the MMI address to which the PHY will respond and is also used for initialization of the cipher (scrambler) key. Each PHY must have a unique address. Refer to Section 7.1.1, "PHY Addressing," on page 84 for additional information. Note: No check is performed to ensure that this address is unique from the other PHY addresses (Port 1 PHY, Port 2 PHY, and Virtual PHY).	R/W NASR Note 13.60	Note 13.62

Note 13.60 Register bits designated as NASR are reset when the Port x PHY Reset is generated via the [Reset Control Register \(RESET_CTL\)](#). The NASR designation is only applicable when the [Reset \(PHY_RST\)](#) bit of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) is set.

Note 13.61 The default value of this field is determined by a combination of the configuration straps `autoneg_strap_x`, `speed_strap_x`, and `duplex_strap_x`. If the `autoneg_strap_x` is 1, then the default MODE[2:0] value is 111b. Else, the default value of this field is determined by the remaining straps. MODE[2]=0, MODE[1]=(`speed_strap_1` for Port 1 PHY, `speed_strap_2` for Port 2 PHY), and MODE[0]=(`duplex_strap_1` for Port 1 PHY, `duplex_strap_2` for Port 2 PHY). Configuration strap values are latched upon the de-assertion of a chip-level reset as described in [Section 4.2.4, "Configuration Straps," on page 45](#). Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for configuration strap definitions.

Note 13.62 The default value of this field is determined by the `phy_addr_sel_strap` configuration strap. Refer to [Section 7.1.1, "PHY Addressing," on page 84](#) for additional information.

Table 13.10 MODE[2:0] Definitions

MODE[2:0]	MODE DEFINITIONS	AFFECTED REGISTER BIT VALUES	
		PHY_BASIC_CONTROL_x	PHY_AN_ADV_x
		[13,12,10,8]	[8,7,6,5]
000	10BASE-T Half Duplex. Auto-negotiation disabled.	0000	N/A
001	10BASE-T Full Duplex. Auto-negotiation disabled.	0001	N/A
010	100BASE-TX Half Duplex. Auto-negotiation disabled. CRS is active during Transmit & Receive.	1000	N/A

Datasheet**Table 13.10 MODE[2:0] Definitions (continued)**

MODE[2:0]	MODE DEFINITIONS	AFFECTED REGISTER BIT VALUES	
		PHY_BASIC_CONTROL_x	PHY_AN_ADV_x
		[13,12,10,8]	[8,7,6,5]
011	100BASE-TX Full Duplex. Auto-negotiation disabled. CRS is active during Receive.	1001	N/A
100	100BASE-TX Half Duplex is advertised. Auto-negotiation enabled. CRS is active during Transmit & Receive.	1100	0100
101	Repeater mode. Auto-negotiation enabled. 100BASE-TX Half Duplex is advertised. CRS is active during Receive.	1100	0100
110	Power Down mode. In this mode the PHY wake-up in Power-Down mode.	N/A	N/A
111	All capable. Auto-negotiation enabled.	X10X	1111

13.2.2.10 Port x PHY Special Control/Status Indication Register (PHY_SPECIAL_CONTROL_STAT_IND_x)

Index (decimal): 27

Size: 16 bits

This read/write register is used to control various options of the Port x PHY.

BITS	DESCRIPTION	TYPE	DEFAULT
15	Auto-MDIX Control (AMDIXCTRL) This bit is responsible for determining the source of Auto-MDIX control for Port x. When set, the Manual MDIX and Auto MDIX straps (manual_mdix_strap_1/auto_mdix_strap_1 for Port 1 PHY, manual_mdix_strap_2/auto_mdix_strap_2 for Port 2 PHY) are overridden, and Auto-MDIX functions are controlled using bit 14 (AMDIXEN) and bit 13 (AMDIXSTATE) of this register. When cleared, Auto-MDIX functionality is controlled by the Manual MDIX and Auto MDIX straps by default. Refer to Section 4.2.4, "Configuration Straps," on page 45 for configuration strap definitions. 0: Port x Auto-MDIX determined by strap inputs 1: Port x Auto-MDIX determined by bits 14 and 13	R/W NASR Note 13.63	0b
14	Auto-MDIX Enable (AMDIXEN) When bit 15 (AMDIXCTRL) of this register is set, this bit is used in conjunction with bit 13 (Auto-MDIX State) to control the Port x Auto-MDIX functionality as shown in Table 13.11 .	R/W NASR Note 13.63	0b
13	Auto-MDIX State (AMDIXSTATE) When bit 15 (AMDIXCTRL) of this register is set, this bit is used in conjunction with bit 14 (Auto-MDIX Enable) to control the Port x Auto-MDIX functionality as shown in Table 13.11 .	R/W NASR Note 13.63	0b
12	RESERVED	RO	-
11	SQE Test Disable (SQEOFF) This bit controls the disabling of the SQE test (Heartbeat). SQE test is enabled by default. 0: SQE test enabled 1: SQE test disabled	R/W NASR Note 13.63	0b
10	Receive PLL Lock Control (VCOFF_LP) This bit controls the locking of the receive PLL. Setting this bit to 1 forces the receive PLL 10M to lock on the reference clock at all times. When in this mode, 10M data packets cannot be received. 0: Receive PLL 10M can lock on reference or line as needed (normal operation) 1: Receive PLL 10M locked onto reference clock at all times	R/W NASR Note 13.63	0b
9:5	RESERVED	RO	-
4	10Base-T Polarity State (XPOL) This bit shows the polarity state of the 10Base-T. 0: Normal Polarity 1: Reversed Polarity	RO	0b
3:0	RESERVED	RO	-

Note 13.63 Register bits designated as NASR are reset when the Port x PHY Reset is generated via the [Reset Control Register \(RESET_CTL\)](#). The NASR designation is only applicable when the [Reset \(PHY_RST\)](#) bit of the [Port x PHY Basic Control Register \(PHY_BASIC_CONTROL_x\)](#) is set.

Table 13.11 Auto-MDIX Enable and Auto-MDIX State Bit Functionality

Auto-MDIX Enable (Bit 14)	Auto-MDIX State (Bit 13)	MODE
0	0	Manual mode, no crossover
0	1	Manual mode, crossover
1	0	Auto-MDIX mode
1	1	RESERVED (do not use this state)

13.2.2.11 Port x PHY Interrupt Source Flags Register (PHY_INTERRUPT_SOURCE_x)

Index (decimal): 29

Size: 16 bits

This read-only register is used to determine to source of various Port x PHY interrupts. All interrupt source bits in this register are read-only and latch high upon detection of the corresponding interrupt (if enabled). A read of this register clears the interrupts. These interrupts are enabled or masked via the [Port x PHY Interrupt Mask Register \(PHY_INTERRUPT_MASK_x\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
15:8	RESERVED	RO	-
7	INT7 This interrupt source bit indicates when the ENERGYON bit of the Port x PHY Mode Control/Status Register (PHY_MODE_CONTROL_STATUS_x) has been set. 0: Not source of interrupt 1: ENERGYON generated	RO/LH	0b
6	INT6 This interrupt source bit indicates Auto-Negotiation is complete. 0: Not source of interrupt 1: Auto-Negotiation complete	RO/LH	0b
5	INT5 This interrupt source bit indicates a remote fault has been detected. 0: Not source of interrupt 1: Remote fault detected	RO/LH	0b
4	INT4 This interrupt source bit indicates a Link Down (link status negated). 0: Not source of interrupt 1: Link Down (link status negated)	RO/LH	0b
3	INT3 This interrupt source bit indicates an Auto-Negotiation LP acknowledge. 0: Not source of interrupt 1: Auto-Negotiation LP acknowledge	RO/LH	0b
2	INT2 This interrupt source bit indicates a Parallel Detection fault. 0: Not source of interrupt 1: Parallel Detection fault	RO/LH	0b
1	INT1 This interrupt source bit indicates an Auto-Negotiation page received. 0: Not source of interrupt 1: Auto-Negotiation page received	RO/LH	0b
0	RESERVED	RO	-

Datasheet

13.2.2.12 Port x PHY Interrupt Mask Register (PHY_INTERRUPT_MASK_x)

Index (decimal): 30

Size: 16 bits

This read/write register is used to enable or mask the various Port x PHY interrupts and is used in conjunction with the [Port x PHY Interrupt Source Flags Register \(PHY_INTERRUPT_SOURCE_x\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
15:8	RESERVED	RO	-
7	INT7_MASK This interrupt mask bit enables/masks the ENERGYON interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
6	INT6_MASK This interrupt mask bit enables/masks the Auto-Negotiation interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
5	INT5_MASK This interrupt mask bit enables/masks the remote fault interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
4	INT4_MASK This interrupt mask bit enables/masks the Link Down (link status negated) interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
3	INT3_MASK This interrupt mask bit enables/masks the Auto-Negotiation LP acknowledge interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
2	INT2_MASK This interrupt mask bit enables/masks the Parallel Detection fault interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
1	INT1_MASK This interrupt mask bit enables/masks the Auto-Negotiation page received interrupt. 0: Interrupt source is masked 1: Interrupt source is enabled	R/W	0b
0	RESERVED	RO	-

13.2.2.13 Port x PHY Special Control/Status Register (PHY_SPECIAL_CONTROL_STATUS_x)

Index (decimal): 31

Size: 16 bits

This read/write register is used to control and monitor various options of the Port x PHY.

BITS	DESCRIPTION	TYPE	DEFAULT																		
15:13	RESERVED	RO	-

13.3 Switch Fabric Control and Status Registers

This section details the various LAN9313/LAN9313i switch control and status registers that reside within the switch fabric. The switch control and status registers allow configuration of each individual switch port, the switch engine, and buffer manager. Switch fabric related interrupts and resets are also controlled and monitored via the switch CSRs.

The switch CSRs are not memory mapped. All switch CSRs are accessed indirectly via the [Switch Fabric CSR Interface Command Register \(SWITCH_CSR_CMD\)](#), [Switch Fabric CSR Interface Data Register \(SWITCH_CSR_DATA\)](#), and [Switch Fabric CSR Interface Direct Data Register \(SWITCH_CSR_DIRECT_DATA\)](#) in the system CSR memory mapped address space. All accesses to the switch CSRs must be performed through these registers. Refer to [Section 13.1.5, "Switch Fabric"](#) for additional information.

Note: The flow control settings of the switch ports are configured via the [Switch Fabric registers: Port 1 Manual Flow Control Register \(MANUAL_FC_1\)](#), [Port 2 Manual Flow Control Register \(MANUAL_FC_2\)](#), and [Port 0\(External MII\) Manual Flow Control Register \(MANUAL_FC_MII\)](#) located in the system CSR address space.

[Table 13.12](#) lists the Switch CSRs and their corresponding addresses in order. The switch fabric registers can be categorized into the following sub-sections:

- [Section 13.3.1, "General Switch CSRs," on page 264](#)
- [Section 13.3.2, "Switch Port 0, Port 1, and Port 2 CSRs," on page 268](#)
- [Section 13.3.3, "Switch Engine CSRs," on page 312](#)
- [Section 13.3.4, "Buffer Manager CSRs," on page 357](#)

Table 13.12 Indirectly Accessible Switch Control and Status Registers

REGISTER #	SYMBOL	REGISTER NAME
General Switch CSRs		
0000h	SW_DEV_ID	Switch Device ID Register, Section 13.3.1.1
0001h	SW_RESET	Switch Reset Register, Section 13.3.1.2
0002h-0003h	RESERVED	Reserved for Future Use
0004h	SW_IMR	Switch Global Interrupt Mask Register, Section 13.3.1.3
0005h	SW_IPR	Switch Global Interrupt Pending Register, Section 13.3.1.4
0006h-03FFh	RESERVED	Reserved for Future Use
Switch Port 0 CSRs		
0400h	MAC_VER_ID_MII	Port 0 MAC Version ID Register, Section 13.3.2.1
0401h	MAC_RX_CFG_MII	Port 0 MAC Receive Configuration Register, Section 13.3.2.2
0402h-040Fh	RESERVED	Reserved for Future Use
0410h	MAC_RX_UNDSIZE_CNT_MII	Port 0 MAC Receive Undersize Count Register, Section 13.3.2.3
0411h	MAC_RX_64_CNT_MII	Port 0 MAC Receive 64 Byte Count Register, Section 13.3.2.4
0412h	MAC_RX_65_TO_127_CNT_MII	Port 0 MAC Receive 65 to 127 Byte Count Register, Section 13.3.2.5
0413h	MAC_RX_128_TO_255_CNT_MII	Port 0 MAC Receive 128 to 255 Byte Count Register, Section 13.3.2.6

Table 13.12 Indirectly Accessible Switch Control and Status Registers (continued)

REGISTER #	SYMBOL	REGISTER NAME
0414h	MAC_RX_256_TO_511_CNT_MII	Port 0 MAC Receive 256 to 511 Byte Count Register, Section 13.3.2.7
0415h	MAC_RX_512_TO_1023_CNT_MII	Port 0 MAC Receive 512 to 1023 Byte Count Register, Section 13.3.2.8
0416h	MAC_RX_1024_TO_MAX_CNT_MII	Port 0 MAC Receive 1024 to Max Byte Count Register, Section 13.3.2.9
0417h	MAC_RX_OVRSZE_CNT_MII	Port 0 MAC Receive Oversize Count Register, Section 13.3.2.10
0418h	MAC_RX_PKTKOK_CNT_MII	Port 0 MAC Receive OK Count Register, Section 13.3.2.11
0419h	MAC_RX_CRCERR_CNT_MII	Port 0 MAC Receive CRC Error Count Register, Section 13.3.2.12
041Ah	MAC_RX_MULCST_CNT_MII	Port 0 MAC Receive Multicast Count Register, Section 13.3.2.13
041Bh	MAC_RX_BRDCST_CNT_MII	Port 0 MAC Receive Broadcast Count Register, Section 13.3.2.14
041Ch	MAC_RX_PAUSE_CNT_MII	Port 0 MAC Receive Pause Frame Count Register, Section 13.3.2.15
041Dh	MAC_RX_FRAG_CNT_MII	Port 0 MAC Receive Fragment Error Count Register, Section 13.3.2.16
041Eh	MAC_RX_JABB_CNT_MII	Port 0 MAC Receive Jabber Error Count Register, Section 13.3.2.17
041Fh	MAC_RX_ALIGN_CNT_MII	Port 0 MAC Receive Alignment Error Count Register, Section 13.3.2.18
0420h	MAC_RX_PKTLEN_CNT_MII	Port 0 MAC Receive Packet Length Count Register, Section 13.3.2.19
0421h	MAC_RX_GOODPKTLEN_CNT_MII	Port 0 MAC Receive Good Packet Length Count Register, Section 13.3.2.20
0422h	MAC_RX_SYMBL_CNT_MII	Port 0 MAC Receive Symbol Error Count Register, Section 13.3.2.21
0423h	MAC_RX_CTLFRM_CNT_MII	Port 0 MAC Receive Control Frame Count Register, Section 13.3.2.22
0424h-043Fh	RESERVED	Reserved for Future Use
0440h	MAC_TX_CFG_MII	Port 0 MAC Transmit Configuration Register, Section 13.3.2.23
0441h	MAC_TX_FC_SETTINGS_MII	Port 0 MAC Transmit Flow Control Settings Register, Section 13.3.2.24
0442h-0450h	RESERVED	Reserved for Future Use
0451h	MAC_TX_DEFER_CNT_MII	Port 0 MAC Transmit Deferred Count Register, Section 13.3.2.25
0452h	MAC_TX_PAUSE_CNT_MII	Port 0 MAC Transmit Pause Count Register, Section 13.3.2.26
0453h	MAC_TX_PKTKOK_CNT_MII	Port 0 MAC Transmit OK Count Register, Section 13.3.2.27
0454h	MAC_TX_64_CNT_MII	Port 0 MAC Transmit 64 Byte Count Register, Section 13.3.2.28

Table 13.12 Indirectly Accessible Switch Control and Status Registers (continued)

REGISTER #	SYMBOL	REGISTER NAME

13.3.1 General Switch CSRs

This section details the general switch fabric CSRs. These registers control the main reset and interrupt functions of the switch fabric. A list of the general switch CSRs and their corresponding register numbers is included in [Table 13.12](#).

13.3.1.1 Switch Device ID Register (SW_DEV_ID)

Register #: 0000h Size: 32 bits

This read-only register contains switch device ID information, including the device type, chip version and revision codes.

BITS	DESCRIPTION	TYPE	DEFAULT
31:24	RESERVED	RO	-
23:16	Device Type Code (DEVICE_TYPE)	RO	03h
15:8	Chip Version Code (CHIP_VERSION)	RO	04h
7:0	Revision Code (REVISION)	RO	07h

Datasheet**13.3.1.2 Switch Reset Register (SW_RESET)**

Register #: 0001h Size: 32 bits

This register contains the switch fabric global reset. Refer to [Section 4.2, "Resets," on page 41](#) for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Switch Fabric Reset (SW_RESET) This bit is the global switch fabric reset. All switch fabric blocks are affected. This bit must be manually cleared.	WO	0b

13.3.1.3 Switch Global Interrupt Mask Register (SW_IMR)

Register #: 0004h Size: 32 bits

This read/write register contains the global interrupt mask for the switch fabric interrupts. All switch related interrupts in the [Switch Global Interrupt Pending Register \(SW_IPR\)](#) may be masked via this register. An interrupt is masked by setting the corresponding bit of this register. Clearing a bit will unmask the interrupt. When an unmasked switch fabric interrupt is generated in the [Switch Global Interrupt Pending Register \(SW_IPR\)](#), the interrupt will trigger the SWITCH_INT bit in the [Interrupt Status Register \(INT_STS\)](#). Refer to [Chapter 5, "System Interrupts," on page 52](#) for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:9	RESERVED	RO	-
8:7	RESERVED Note: These bits must be written as 11b	R/W	11b
6	Buffer Manager Interrupt Mask (BM) When set, prevents the generation of switch fabric interrupts due to the Buffer Manager via the Buffer Manager Interrupt Pending Register (BM_IPR) . The status bits in the SW_IPR register are not affected.	R/W	1b
5	Switch Engine Interrupt Mask (SWE) When set, prevents the generation of switch fabric interrupts due to the Switch Engine via the Switch Engine Interrupt Pending Register (SWE_IPR) . The status bits in the SW_IPR register are not affected.	R/W	1b
4:3	RESERVED Note: These bits must be written as 11b	R/W	11b
2	Port 2 MAC Interrupt Mask (MAC_2) When set, prevents the generation of switch fabric interrupts due to the Port 2 MAC via the MAC_IPR_2 register (see Section 13.3.2.44, on page 311). The status bits in the SW_IPR register are not affected.	R/W	1b
1	Port 1 MAC Interrupt Mask (MAC_1) When set, prevents the generation of switch fabric interrupts due to the Port 1 MAC via the MAC_IPR_1 register (see Section 13.3.2.44, on page 311). The status bits in the SW_IPR register are not affected.	R/W	1b
0	Port 0 MAC Interrupt Mask (MAC_MII) When set, prevents the generation of switch fabric interrupts due to the Port 0 MAC via the MAC_IPR_MII register (see Section 13.3.2.44, on page 311). The status bits in the SW_IPR register are not affected.	R/W	1b

Datasheet

13.3.1.4 Switch Global Interrupt Pending Register (SW_IPR)

Register #: 0005h Size: 32 bits

This read-only register contains the pending global interrupts for the switch fabric. A set bit indicates an unmasked bit in the corresponding switch fabric sub-system has been triggered. All switch related interrupts in this register may be masked via the [Switch Global Interrupt Mask Register \(SW_IMR\)](#) register. When an unmasked switch fabric interrupt is generated in this register, the interrupt will trigger the SWITCH_INT bit in the [Interrupt Status Register \(INT_STS\)](#). Refer to [Chapter 5, "System Interrupts," on page 52](#) for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:7	RESERVED	RO	-
6	Buffer Manager Interrupt (BM) Set when any unmasked bit in the Buffer Manager Interrupt Pending Register (BM_IPR) is triggered. This bit is cleared upon a read.	RC	0b
5	Switch Engine Interrupt (SWE) Set when any unmasked bit in the Switch Engine Interrupt Pending Register (SWE_IPR) is triggered. This bit is cleared upon a read.	RC	0b
4:3	RESERVED	RO	-
2	Port 2 MAC Interrupt (MAC_2) Set when any unmasked bit in the MAC_IPR_2 register (see Section 13.3.2.44, on page 311) is triggered. This bit is cleared upon a read.	RC	0b
1	Port 1 MAC Interrupt (MAC_1) Set when any unmasked bit in the MAC_IPR_1 register (see Section 13.3.2.44, on page 311) is triggered. This bit is cleared upon a read.	RC	0b
0	Port 0 MAC Interrupt (MAC_MII) Set when any unmasked bit in the MAC_IPR_MII register (see Section 13.3.2.44, on page 311) is triggered. This bit is cleared upon a read.	RC	0b

13.3.2 Switch Port 0, Port 1, and Port 2 CSRs

This section details the switch Port 0(External MII), Port 1, and Port 2 CSRs. Each port provides a functionally identical set of registers which allow for the configuration of port settings, interrupts, and the monitoring of the various packet counters.

Because the Port 0, Port 1, and Port 2 CSRs are functionally identical, their register descriptions have been consolidated. A lowercase “x” has been appended to the end of each switch port register name in this section, where “x” should be replaced with “MII”, “1”, or “2” for the Port 0, Port 1, or Port 2 registers respectively. A list of the Switch Port 0, Port 1, and Port 2 registers and their corresponding register numbers is included in [Table 13.12](#).

13.3.2.1 Port x MAC Version ID Register (MAC_VER_ID_x)

Register #:	Port0: 0400h	Size:	32 bits
	Port1: 0800h		
	Port2: 0C00h		

This read-only register contains switch device ID information, including the device type, chip version and revision codes.

BITS	DESCRIPTION	TYPE	DEFAULT
31:12	RESERVED	RO	-
11:8	Device Type Code (DEVICE_TYPE)	RO	5h
7:4	Chip Version Code (CHIP_VERSION)	RO	8h
3:0	Revision Code (REVISION)	RO	3h

Datasheet**13.3.2.2 Port x MAC Receive Configuration Register (MAC_RX_CFG_x)**

Register #: Port0: 0401h Size: 32 bits
 Port1: 0801h
 Port2: 0C01h

This read/write register configures the packet type passing parameters of the port.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7	RESERVED Note: This bit must always be written as 0.	R/W	0b
6	RESERVED	RO	-
5	Enable Receive Own Transmit When set, the switch port will receive its own transmission if it is looped back from the PHY. Normally, this function is only used in Half Duplex PHY loopback.	R/W	0b
4	RESERVED	RO	-
3	Jumbo2K When set, the maximum packet size accepted is 2048 bytes. Statistics boundaries are also adjusted.	R/W	0b
2	RESERVED	RO	-
1	Reject MAC Types When set, MAC control frames (packets with a type field of 8808h) are filtered. When cleared, MAC Control frames, other than MAC Control Pause frames, are sent to the forwarding process. MAC Control Pause frames are always consumed by the switch.	R/W	1b
0	RX Enable When set, the receive port is enabled. When cleared, the receive port is disabled.	R/W	1b

13.3.2.3 Port x MAC Receive Undersize Count Register (MAC_RX_UNDSIZE_CNT_x)

Register #: Port0: 0410h Size: 32 bits
 Port1: 0810h
 Port2: 0C10h

This register provides a counter of undersized packets received by the port. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Undersize Count of packets that have less than 64 byte and a valid FCS. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 115 hours.	RC	00000000h

Datasheet**13.3.2.4 Port x MAC Receive 64 Byte Count Register (MAC_RX_64_CNT_x)**

Register #: Port0: 0411h Size: 32 bits
 Port1: 0811h
 Port2: 0C11h

This register provides a counter of 64 byte packets received by the port. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX 64 Bytes Count of packets (including bad packets) that have exactly 64 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Note: A bad packet is defined as a packet that has an FCS or Symbol error. For this counter, a packet that is not an integral number of bytes is rounded down to the nearest byte.

13.3.2.5 Port x MAC Receive 65 to 127 Byte Count Register (MAC_RX_65_TO_127_CNT_x)

Register #: Port0: 0412h Size: 32 bits
 Port1: 0812h
 Port2: 0C12h

This register provides a counter of received packets between the size of 65 to 127 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX 65 to 127 Bytes Count of packets (including bad packets) that have between 65 and 127 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 487 hours.	RC	00000000h

Note: A bad packet is defined as a packet that has an FCS or Symbol error. For this counter, a packet that is not an integral number of bytes is rounded down to the nearest byte.

Datasheet**13.3.2.6 Port x MAC Receive 128 to 255 Byte Count Register (MAC_RX_128_TO_255_CNT_x)**

Register #: Port0: 0413h Size: 32 bits
 Port1: 0813h
 Port2: 0C13h

This register provides a counter of received packets between the size of 128 to 255 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX 128 to 255 Bytes Count of packets (including bad packets) that have between 128 and 255 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 848 hours.	RC	00000000h

Note: A bad packet is defined as a packet that has an FCS or Symbol error. For this counter, a packet that is not an integral number of bytes is rounded down to the nearest byte.

13.3.2.7 Port x MAC Receive 256 to 511 Byte Count Register (MAC_RX_256_TO_511_CNT_x)

Register #: Port0: 0414h Size: 32 bits
 Port1: 0814h
 Port2: 0C14h

This register provides a counter of received packets between the size of 256 to 511 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX 256 to 511 Bytes Count of packets (including bad packets) that have between 256 and 511 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 1581 hours.	RC	00000000h

Note: A bad packet is defined as a packet that has an FCS or Symbol error. For this counter, a packet that is not an integral number of bytes is rounded down to the nearest byte.

Datasheet**13.3.2.8 Port x MAC Receive 512 to 1023 Byte Count Register (MAC_RX_512_TO_1023_CNT_x)**

Register #: Port0: 0415h Size: 32 bits
 Port1: 0815h
 Port2: 0C15h

This register provides a counter of received packets between the size of 512 to 1023 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX 512 to 1023 Bytes Count of packets (including bad packets) that have between 512 and 1023 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 3047 hours.	RC	00000000h

Note: A bad packet is defined as a packet that has an FCS or Symbol error. For this counter, a packet that is not an integral number of bytes is rounded down to the nearest byte.

13.3.2.9 Port x MAC Receive 1024 to Max Byte Count Register (MAC_RX_1024_TO_MAX_CNT_x)

Register #: Port0: 0416h Size: 32 bits
 Port1: 0816h
 Port2: 0C16h

This register provides a counter of received packets between the size of 1024 to the maximum allowable number bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX 1024 to Max Bytes Count of packets (including bad packets) that have between 1024 and the maximum allowable number of bytes. The max number of bytes is 1518 for untagged packets and 1522 for tagged packets. If Jumbo2K (bit 3) is set in the Port x MAC Receive Configuration Register (MAC_RX_CFG_x) , the max number of bytes is 2048. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 5979 hours.	RC	00000000h

Note: A bad packet is defined as a packet that has an FCS or Symbol error. For this counter, a packet with the maximum number of bytes that is not an integral number of bytes (e.g. a 1518 1/2 byte packet) is counted.

Datasheet**13.3.2.10 Port x MAC Receive Oversize Count Register (MAC_RX_OVRSIZE_CNT_x)**

Register #: Port0: 0417h Size: 32 bits
 Port1: 0817h
 Port2: 0C17h

This register provides a counter of received packets with a size greater than the maximum byte size. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>RX Oversize Count of packets that have more than the maximum allowable number of bytes and a valid FCS. The max number of bytes is 1518 for untagged packets and 1522 for tagged packets. If Jumbo2K (bit 3) is set in the Port x MAC Receive Configuration Register (MAC_RX_CFG_x), the max number of bytes is 2048.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 8813 hours.</p>	RC	00000000h

Note: For this counter, a packet with the maximum number of bytes that is not an integral number of bytes (e.g. a 1518 1/2 byte packet) is not considered oversize.

13.3.2.11 Port x MAC Receive OK Count Register (MAC_RX_PKTOK_CNT_x)

Register #: Port0: 0418h Size: 32 bits
 Port1: 0818h
 Port2: 0C18h

This register provides a counter of received packets that are of proper length and are free of errors. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX OK Count of packets that are of proper length and are free of errors. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Note: A bad packet is one that has a FCS or Symbol error.

Datasheet**13.3.2.12 Port x MAC Receive CRC Error Count Register (MAC_RX_CRCERR_CNT_x)**

Register #: Port0: 0419h Size: 32 bits
 Port1: 0819h
 Port2: 0C19h

This register provides a counter of received packets that with CRC errors. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>RX CRC Count of packets that have between 64 and the maximum allowable number of bytes and have a bad FCS, but do not have an extra nibble. The max number of bytes is 1518 for untagged packets and 1522 for tagged packets. If Jumbo2K (bit 3) is set in the Port x MAC Receive Configuration Register (MAC_RX_CFG_x), the max number of bytes is 2048.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 137 hours.</p>	RC	00000000h

13.3.2.13 Port x MAC Receive Multicast Count Register (MAC_RX_MULCST_CNT_x)

Register #: Port0: 041Ah Size: 32 bits
 Port1: 081Ah
 Port2: 0C1Ah

This register provides a counter of valid received packets with a multicast destination address. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Multicast Count of good packets (proper length and free of errors), including MAC control frames, that have a multicast destination address (not including broadcasts). Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Note: A bad packet is one that has a FCS or Symbol error.

Datasheet**13.3.2.14 Port x MAC Receive Broadcast Count Register (MAC_RX_BRDCST_CNT_x)**

Register #: Port0: 041Bh Size: 32 bits
 Port1: 081Bh
 Port2: 0C1Bh

This register provides a counter of valid received packets with a broadcast destination address. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Broadcast Count of valid packets (proper length and free of errors) that have a broadcast destination address. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Note: A bad packet is one that has a FCS or Symbol error.

13.3.2.15 Port x MAC Receive Pause Frame Count Register (MAC_RX_PAUSE_CNT_x)

Register #: Port0: 041Ch Size: 32 bits
 Port1: 081Ch
 Port2: 0C1Ch

This register provides a counter of valid received pause frame packets. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Pause Frame Count of valid packets (proper length and free of errors) that have a type field of 8808h and an op-code of 0001(Pause). Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Note: A bad packet is one that has a FCS or Symbol error.

Datasheet**13.3.2.16 Port x MAC Receive Fragment Error Count Register (MAC_RX_FRAG_CNT_x)**

Register #: Port0: 041Dh Size: 32 bits
 Port1: 081Dh
 Port2: 0C1Dh

This register provides a counter of received packets of less than 64 bytes and a FCS error. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Fragment Count of packets that have less than 64 bytes and a FCS error. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 115 hours.	RC	00000000h

13.3.2.17 Port x MAC Receive Jabber Error Count Register (MAC_RX_JABB_CNT_x)

Register #: Port0: 041Eh Size: 32 bits
 Port1: 081Eh
 Port2: 0C1Eh

This register provides a counter of received packets with greater than the maximum allowable number of bytes and a FCS error. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>RX Jabber Count of packets that have more than the maximum allowable number of bytes and a FCS error. The max number of bytes is 1518 for untagged packets and 1522 for tagged packets. If Jumbo2K (bit 3) is set in the Port x MAC Receive Configuration Register (MAC_RX_CFG_x), the max number of bytes is 2048.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 8813 hours.</p>	RC	00000000h

Note: For this counter, a packet with the maximum number of bytes that is not an integral number of bytes (e.g. a 1518 1/2 byte packet) and contains a FCS error is not considered jabber and is not counted here.

Datasheet**13.3.2.18 Port x MAC Receive Alignment Error Count Register (MAC_RX_ALIGN_CNT_x)**

Register #: Port0: 041Fh Size: 32 bits
 Port1: 081Fh
 Port2: 0C1Fh

This register provides a counter of received packets with 64 bytes to the maximum allowable, and a FCS error. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>RX Alignment Count of packets that have between 64 bytes and the maximum allowable number of bytes and are not byte aligned and have a bad FCS. The max number of bytes is 1518 for untagged packets and 1522 for tagged packets. If Jumbo2K (bit 3) is set in the Port x MAC Receive Configuration Register (MAC_RX_CFG_x), the max number of bytes is 2048.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

Note: For this counter, a packet with the maximum number of bytes that is not an integral number of bytes (e.g. a 1518 1/2 byte packet) and a FCS error is considered an alignment error and is counted.

13.3.2.19 Port x MAC Receive Packet Length Count Register (MAC_RX_PKTLEN_CNT_x)

Register #:	Port0: 0420h	Size:	32 bits
	Port1: 0820h		
	Port2: 0C20h		

This register provides a counter of total bytes received. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Bytes Count of total bytes received (including bad packets). Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 5.8 hours.	RC	00000000h

Note: If necessary, for oversized packets, the packet is either truncated at 1518 bytes (untagged, Jumbo2K=0), 1522 bytes (tagged, Jumbo2K=0), or 2048 bytes (Jumbo2K=1). If this occurs, the byte count recorded is 1518, 1522, or 2048, respectively. The Jumbo2K bit is located in the [Port x MAC Receive Configuration Register \(MAC_RX_CFG_x\)](#).

Note: A bad packet is one that has an FCS or Symbol error. For this counter, a packet that is not an integral number of bytes (e.g. a 1518 1/2 byte packet) is rounded down to the nearest byte.

Datasheet**13.3.2.20 Port x MAC Receive Good Packet Length Count Register (MAC_RX_GOODPKTLEN_CNT_x)**

Register #: Port0: 0421h Size: 32 bits
 Port1: 0821h
 Port2: 0C21h

This register provides a counter of total bytes received in good packets. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Good Bytes Count of total bytes received in good packets (proper length and free of errors). Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 5.8 hours.	RC	00000000h

Note: A bad packet is one that has an FCS or Symbol error.

13.3.2.21 Port x MAC Receive Symbol Error Count Register (MAC_RX_SYMBOL_CNT_x)

Register #: Port0: 0422h Size: 32 bits
 Port1: 0822h
 Port2: 0C22h

This register provides a counter of received packets with a symbol error. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Symbol Count of packets that had a receive symbol error. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 115 hours.	RC	00000000h

Datasheet**13.3.2.22 Port x MAC Receive Control Frame Count Register (MAC_RX_CTLFRM_CNT_x)**

Register #: Port0: 0423h Size: 32 bits
 Port1: 0823h
 Port2: 0C23h

This register provides a counter of good packets with a type field of 8808h. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RX Control Frame Count of good packets (proper length and free of errors) that have a type field of 8808h. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Note: A bad packet is one that has an FCS or Symbol error.

13.3.2.23 Port x MAC Transmit Configuration Register (MAC_TX_CFG_x)

Register #: Port0: 0440h Size: 32 bits
 Port1: 0840h
 Port2: 0C40h

This read/write register configures the transmit packet parameters of the port.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7	MAC Counter Test When set, TX and RX counters that normally clear to 0 when read, will be set to 7FFF_FFFCh when read with the exception of the Port x MAC Receive Packet Length Count Register (MAC_RX_PKTLEN_CNT_x) , Port x MAC Transmit Packet Length Count Register (MAC_TX_PKTLEN_CNT_x) , and Port x MAC Receive Good Packet Length Count Register (MAC_RX_GOODPKTLEN_CNT_x) counters which will be set to 7FFF_FF80h.	R/W	0b
6:2	IFG Config These bits control the transmit inter-frame gap. IFG bit times = (IFG Config *4) + 12	R/W	10101b
1	TX Pad Enable When set, packets shorter than 64 bytes are padded with zeros if needed and a FCS is appended. Packets that are 60 bytes or less will become 64 bytes. Packets that are 61, 62, and 63 bytes will become 65, 66, and 67 bytes respectively.	R/W	1b
0	TX Enable When set, the transmit port is enabled. When cleared, the transmit port is disabled.	R/W	1b

Datasheet**13.3.2.24 Port x MAC Transmit Flow Control Settings Register (MAC_TX_FC_SETTINGS_x)**

Register #: Port0: 0441h Size: 32 bits
 Port1: 0841h
 Port2: 0C41h

This read/write register configures the flow control settings of the port.

BITS	DESCRIPTION	TYPE	DEFAULT
31:18	RESERVED	RO	-
17:16	Backoff Reset RX/TX Half duplex-only. Determines when the truncated binary exponential backoff attempts counter is reset. 00 = Reset on successful transmission (IEEE standard) 01 = Reset on successful reception 1X = Reset on either successful transmission or reception	R/W	00b
15:0	Pause Time Value The value that is inserted into the transmitted pause packet when the switch wants to "XOFF" its link partner.	R/W	FFFFh

13.3.2.25 Port x MAC Transmit Deferred Count Register (MAC_TX_DEFER_CNT_x)

Register #: Port0: 0451h Size: 32 bits
 Port1: 0851h
 Port2: 0C51h

This register provides a counter deferred packets. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>TX Deferred Count of packets that were available for transmission but were deferred on the first transmit attempt due to network traffic (either on receive or prior transmission). This counter is not incremented on collisions. This counter is incremented only in half-duplex operation.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

Datasheet**13.3.2.26 Port x MAC Transmit Pause Count Register (MAC_TX_PAUSE_CNT_x)**

Register #: Port0: 0452h Size: 32 bits
 Port1: 0852h
 Port2: 0C52h

This register provides a counter of transmitted pause packets. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX Pause Count of pause packets transmitted. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

13.3.2.27 Port x MAC Transmit OK Count Register (MAC_TX_PKTOK_CNT_x)

Register #: Port0: 0453h Size: 32 bits
 Port1: 0853h
 Port2: 0C53h

This register provides a counter of successful transmissions. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX OK Count of successful transmissions. Undersize packets are not included in this count. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.2.28 Port x MAC Transmit 64 Byte Count Register (MAC_TX_64_CNT_x)**

Register #: Port0: 0454h Size: 32 bits
 Port1: 0854h
 Port2: 0C54h

This register provides a counter of 64 byte packets transmitted by the port. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX 64 Bytes Count of packets that have exactly 64 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

13.3.2.29 Port x MAC Transmit 65 to 127 Byte Count Register (MAC_TX_65_TO_127_CNT_x)

Register #: Port0: 0455h Size: 32 bits
 Port1: 0855h
 Port2: 0C55h

This register provides a counter of transmitted packets between the size of 65 to 127 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX 65 to 127 Bytes Count of packets that have between 65 and 127 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 487 hours.	RC	00000000h

Datasheet**13.3.2.30 Port x MAC Transmit 128 to 255 Byte Count Register (MAC_TX_128_TO_255_CNT_x)**

Register #: Port0: 0456h Size: 32 bits
 Port1: 0856h
 Port2: 0C56h

This register provides a counter of transmitted packets between the size of 128 to 255 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX 128 to 255 Bytes Count of packets that have between 128 and 255 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 848 hours.	RC	00000000h

13.3.2.31 Port x MAC Transmit 256 to 511 Byte Count Register (MAC_TX_256_TO_511_CNT_x)

Register #: Port0: 0457h Size: 32 bits
 Port1: 0857h
 Port2: 0C57h

This register provides a counter of transmitted packets between the size of 256 to 511 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX 256 to 511 Bytes Count of packets that have between 256 and 511 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 1581 hours.	RC	00000000h

Datasheet**13.3.2.32 Port x MAC Transmit 512 to 1023 Byte Count Register (MAC_TX_512_TO_1023_CNT_x)**

Register #: Port0: 0458h Size: 32 bits
 Port1: 0858h
 Port2: 0C58h

This register provides a counter of transmitted packets between the size of 512 to 1023 bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX 512 to 1023 Bytes Count of packets that have between 512 and 1023 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 3047 hours.	RC	00000000h

13.3.2.33 Port x MAC Transmit 1024 to Max Byte Count Register (MAC_TX_1024_TO_MAX_CNT_x)

Register #: Port0: 0459h Size: 32 bits
 Port1: 0859h
 Port2: 0C59h

This register provides a counter of transmitted packets between the size of 1024 to the maximum allowable number bytes. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX 1024 to Max Bytes Count of packets that have more than 1024 bytes. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 5979 hours.	RC	00000000h

Datasheet**13.3.2.34 Port x MAC Transmit Undersize Count Register (MAC_TX_UNDSIZE_CNT_x)**

Register #: Port0: 045Ah Size: 32 bits
 Port1: 085Ah
 Port2: 0C5Ah

This register provides a counter of undersized packets transmitted by the port. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>TX Undersize Count of packets that have less than 64 bytes.</p> <p>Note: This condition could occur when TX padding is disabled and a tag is removed.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 458 hours.</p>	RC	00000000h

13.3.2.35 Port x MAC Transmit Packet Length Count Register (MAC_TX_PKTLEN_CNT_x)

Register #: Port0: 045Ch Size: 32 bits
 Port1: 085Ch
 Port2: 0C5Ch

This register provides a counter of total bytes transmitted. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX Bytes Count of total bytes transmitted (does not include bytes from collisions, but does include bytes from Pause packets). Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 5.8 hours.	RC	00000000h

Datasheet**13.3.2.36 Port x MAC Transmit Broadcast Count Register (MAC_TX_BRDCST_CNT_x)**

Register #: Port0: 045Dh Size: 32 bits
 Port1: 085Dh
 Port2: 0C5Dh

This register provides a counter of transmitted broadcast packets. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX Broadcast Count of broadcast packets transmitted. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

13.3.2.37 Port x MAC Transmit Multicast Count Register (MAC_TX_MULCST_CNT_x)

Register #: Port0: 045Eh Size: 32 bits
 Port1: 085Eh
 Port2: 0C5Eh

This register provides a counter of transmitted multicast packets. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX Multicast Count of multicast packets transmitted including MAC Control Pause frames. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.2.38 Port x MAC Transmit Late Collision Count Register (MAC_TX_LATECOL_CNT_x)**

Register #: Port0: 045Fh Size: 32 bits
 Port1: 085Fh
 Port2: 0C5Fh

This register provides a counter of transmitted packets which experienced a late collision. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>TX Late Collision Count of transmitted packets that experienced a late collision. This counter is incremented only in half-duplex operation.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

13.3.2.39 Port x MAC Transmit Excessive Collision Count Register (MAC_TX_EXCCOL_CNT_x)

Register #: Port0: 0460h Size: 32 bits
 Port1: 0860h
 Port2: 0C60h

This register provides a counter of transmitted packets which experienced 16 collisions. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>TX Excessive Collision Count of transmitted packets that experienced 16 collisions. This counter is incremented only in half-duplex operation.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 1466 hours.</p>	RC	00000000h

Datasheet**13.3.2.40 Port x MAC Transmit Single Collision Count Register (MAC_TX_SNGLECOL_CNT_x)**

Register #: Port0: 0461h Size: 32 bits
 Port1: 0861h
 Port2: 0C61h

This register provides a counter of transmitted packets which experienced exactly 1 collision. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>TX Excessive Collision Count of transmitted packets that experienced exactly 1 collision. This counter is incremented only in half-duplex operation.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 573 hours.</p>	RC	00000000h

13.3.2.41 Port x MAC Transmit Multiple Collision Count Register (MAC_TX_MULTICOL_CNT_x)

Register #: Port0: 0462h Size: 32 bits
 Port1: 0862h
 Port2: 0C62h

This register provides a counter of transmitted packets which experienced between 2 and 15 collisions. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	TX Excessive Collision Count of transmitted packets that experienced between 2 and 15 collisions. This counter is incremented only in half-duplex operation. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 664 hours.	RC	00000000h

Datasheet**13.3.2.42 Port x MAC Transmit Total Collision Count Register (MAC_TX_TOTALCOL_CNT_x)**

Register #: Port0: 0463h Size: 32 bits
 Port1: 0863h
 Port2: 0C63h

This register provides a counter of total collisions including late collisions. The counter is cleared upon being read.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>TX Total Collision Total count of collisions including late collisions. This counter is incremented only in half-duplex operation.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 92 hours.</p>	RC	00000000h

13.3.2.43 Port x MAC Interrupt Mask Register (MAC_IMR_x)

Register #: Port0: 0480h Size: 32 bits
 Port1: 0880h
 Port2: 0C80h

This register contains the Port x interrupt mask. Port x related interrupts in the [Port x MAC Interrupt Pending Register \(MAC_IPR_x\)](#) may be masked via this register. An interrupt is masked by setting the corresponding bit of this register. Clearing a bit will unmask the interrupt. Refer to [Chapter 5, "System Interrupts," on page 52](#) for more information.

Note: There are no possible Port x interrupt conditions available. This register exists for future use, and should be configured as indicated for future compatibility.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7:0	RESERVED Note: These bits must be written as 11h	R/W	11h

Datasheet**13.3.2.44 Port x MAC Interrupt Pending Register (MAC_IPR_x)**

Register #: Port0: 0481h Size: 32 bits
 Port1: 0881h
 Port2: 0C81h

This read-only register contains the pending Port x interrupts. A set bit indicates an interrupt has been triggered. All interrupts in this register may be masked via the [Port x MAC Interrupt Pending Register \(MAC_IPR_x\)](#) register. Refer to [Chapter 5, "System Interrupts,"](#) on page 52 for more information.

Note: There are no possible Port x interrupt conditions available. This register exists for future use.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	RESERVED	RO	-

13.3.3 Switch Engine CSRs

This section details the switch engine related CSRs. These registers allow configuration and monitoring of the various switch engine components including the ALR, VLAN, Port VID, and DIFFSERV tables. A list of the general switch CSRs and their corresponding register numbers is included in [Table 13.12](#).

13.3.3.1 Switch Engine ALR Command Register (SWE_ALR_CMD)

Register #: 1800h Size: 32 bits

This register is used to manually read and write MAC addresses from/into the ALR table.

For a read access, the [Switch Engine ALR Read Data 0 Register \(SWE_ALR_RD_DAT_0\)](#) and [Switch Engine ALR Read Data 1 Register \(SWE_ALR_RD_DAT_1\)](#) should be read following the setting of bit 1(Get First Entry) or bit 0(Get Next Entry) of this register.

For write access, the [Switch Engine ALR Write Data 0 Register \(SWE_ALR_WR_DAT_0\)](#) and [Switch Engine ALR Write Data 1 Register \(SWE_ALR_WR_DAT_1\)](#) registers should first be written with the MAC address, followed by the setting of bit 2(Make Entry) of this register. The Make Pending bit in the [Switch Engine ALR Command Status Register \(SWE_ALR_CMD_STS\)](#) register indicates when the command is finished.

Refer to [Chapter 6, "Switch Fabric," on page 57](#) for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:3	RESERVED	RO	-
2	Make Entry When set, the contents of ALR_WR_DAT_0 and ALR_WR_DAT_1 are written into the ALR table. The ALR logic determines the location where the entry is written. This command can also be used to change or delete a previously written or automatically learned entry. This bit has no affect when written low. This bit must be cleared once the ALR Make command is completed, which can be determined by the ALR Status bit in the Switch Engine ALR Command Status Register (SWE_ALR_CMD_STS) register.	R/W	0b
1	Get First Entry When set, the ALR read pointer is reset to the beginning of the ALR table and the ALR table is searched for the first valid entry, which is loaded into the ALR_RD_DAT_0 and ALR_RD_DAT_1 registers. The bit has no affect when written low. This bit must be cleared after it is set.	R/W	0b
0	Get Next Entry When set, the next valid entry in the ALR MAC address table is loaded into the ALR_RD_DAT_0 and ALR_RD_DAT_1 registers. This bit has no affect when written low. This bit must be cleared after it is set.	R/W	0b

Datasheet**13.3.3.2 Switch Engine ALR Write Data 0 Register (SWE_ALR_WR_DAT_0)**

Register #: 1801h Size: 32 bits

This register is used in conjunction with the [Switch Engine ALR Write Data 1 Register \(SWE_ALR_WR_DAT_1\)](#) and contains the first 32 bits of ALR data to be manually written via the Make Entry command in the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	MAC Address This field contains the first 32 bits of the ALR entry that will be written into the ALR table. These bits correspond to the first 32 bits of the MAC address. Bit 0 holds the LSB of the first byte (the multicast bit).	R/W	00000000h

13.3.3.3 Switch Engine ALR Write Data 1 Register (SWE_ALR_WR_DAT_1)

Register #: 1802h Size: 32 bits

This register is used in conjunction with the [Switch Engine ALR Write Data 0 Register \(SWE_ALR_WR_DAT_0\)](#) and contains the last 32 bits of ALR data to be manually written via the Make Entry command in the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#).

BITS	DESCRIPTION	TYPE	DEFAULT
31:25	RESERVED	RO	-
24	Valid When set, this bit makes the entry valid. It can be cleared to invalidate a previous entry that contained the specified MAC address.	R/W	0b
23	Age/Override This bit is used by the aging and forwarding processes. If the Static bit of this register is cleared, this bit should be set so that the entry will age in the normal amount of time. If the Static bit is set, this bit is used as a port state override bit. When set, packets received with a destination address that matches the MAC address in the SWE_ALR_WR_DAT_1 and SWE_ALR_WR_DAT_0 registers will be forwarded regardless of the port state of the ingress or egress port(s). This is typically used to allow the reception of BPDU packets in the non-forwarding state.	R/W	0b
22	Static When this bit is set, this entry will not be removed by the aging process and/or be changed by the learning process. When this bit is cleared, this entry will be automatically removed after 5 to 10 minutes of inactivity. Inactivity is defined as no packets being received with a source address that matches this MAC address. Note: This bit is normally set when adding manual entries. It must be cleared when removing an entry (clearing the Valid bit).	R/W	0b
21	Filter When set, packets with a destination address that matches this MAC address will be filtered.	R/W	0b
20:19	Priority These bits specify the priority that is used for packets with a destination address that matches this MAC address. This priority is only used if the Static bit of this register is set, and the DA Highest Priority (bit 5) in the Switch Engine Global Ingress Configuration Register (SWE_GLOBAL INGRSS_CFG) is set.	R/W	00b

Datasheet

BITS	DESCRIPTION	TYPE	DEFAULT																		
18:16	<p>Port These bits indicate the port(s) associated with this MAC address. When bit 18 is cleared, a single port is selected. 15:0	<p>MAC Address This field contains the last 16 bits of the ALR entry that will be written into the ALR table. They correspond to the last 16 bits of the MAC address. Bit 15 holds the MSB of the last byte (the last bit on the wire). The first 32 bits of the MAC address are located in the Switch Engine ALR Write Data 0 Register (SWE_ALR_WR_DAT_0).</p>	R/W	0000h																		

13.3.3.4 Switch Engine ALR Read Data 0 Register (SWE_ALR_RD_DAT_0)

Register #: 1805h Size: 32 bits

This register is used in conjunction with the [Switch Engine ALR Read Data 1 Register \(SWE_ALR_RD_DAT_1\)](#) to read the ALR table. It contains the first 32 bits of the ALR entry and is loaded via the Get First Entry or Get Next Entry commands in the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#). This register is only valid when either of the Valid or End of Table bits in the [Switch Engine ALR Read Data 1 Register \(SWE_ALR_RD_DAT_1\)](#) are set.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	MAC Address This field contains the first 32 bits of the ALR entry. These bits correspond to the first 32 bits of the MAC address. Bit 0 holds the LSB of the first byte (the multicast bit).	RO	00000000h

Datasheet**13.3.3.5 Switch Engine ALR Read Data 1 Register (SWE_ALR_RD_DAT_1)**

Register #: 1806h Size: 32 bits

This register is used in conjunction with the [Switch Engine ALR Read Data 0 Register \(SWE_ALR_RD_DAT_0\)](#) to read the ALR table. It contains the last 32 bits of the ALR entry and is loaded via the Get First Entry or Get Next Entry commands in the [Switch Engine ALR Command Register \(SWE_ALR_CMD\)](#). This register is only valid when either of the Valid or End of Table bits are set.

BITS	DESCRIPTION	TYPE	DEFAULT
31:25	RESERVED	RO	-
24	Valid This bit is cleared when the Get First Entry or Get Next Entry bits of the Switch Engine ALR Command Register (SWE_ALR_CMD) are written. This bit is set when a valid entry is found in the ALR table. This bit stays cleared when the top of the ALR table is reached without finding an entry.	RO	0b
23	End of Table This bit indicates that the end of the ALR table has been reached and further Get Next Entry commands are not required. Note: The Valid bit may or may not be set when the end of the table is reached.	RO	0b
22	Static Indicates that this entry will not be removed by the aging process. When this bit is cleared, this entry will be automatically removed after 5 to 10 minutes of inactivity. Inactivity is defined as no packets being received with a source address that matches this MAC address.	RO	0b
21	Filter When set, indicates that packets with a destination address that matches this MAC address will be filtered.	RO	0b
20:19	Priority These bits indicate the priority that is used for packets with a destination address that matches this MAC address. This priority is only used if the Static bit of this register is set, and the DA Highest Priority (bit 5) in the Switch Engine Global Ingress Configuration Register (SWE_GLOBAL INGRSS_CFG) register is set.	RO	00b

Datasheet**13.3.3.6 Switch Engine ALR Command Status Register (SWE_ALR_CMD_STS)**

Register #: 1808h Size: 32 bits

This register indicates the current ALR command status.

BITS	DESCRIPTION	TYPE	DEFAULT
31:2	RESERVED	RO	-
1	ALR Init Done When set, indicates that the ALR table has finished being initialized by the reset process. The initialization is performed upon any reset that resets the switch fabric. The initialization takes approximately 20uS. During this time, any received packet will be dropped. Software should monitor this bit before writing any of the ALR tables or registers.	RO SS	Note 13.64
0	Make Pending When set, indicates that the Make Entry command is taking place. This bit is cleared once the Make Entry command has finished.	RO SC	0b

Note 13.64 The default value of this bit is 0 immediately following any switch fabric reset and then self-sets to 1 once the ALR table is initialized.

13.3.3.7 Switch Engine ALR Configuration Register (SWE_ALR_CFG)

Register #: 1809h Size: 32 bits

This register controls the ALR aging timer duration.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	ALR Age Test When set, this bit decreases the aging timer from 5 minutes to 50mS.	R/W	0b

Datasheet**13.3.3.8 Switch Engine VLAN Command Register (SWE_VLAN_CMD)**

Register #: 180Bh Size: 32 bits

This register is used to read and write the VLAN or Port VID tables. A write to this address performs the specified access.

For a read access, the Operation Pending bit in the [Switch Engine VLAN Command Status Register \(SWE_VLAN_CMD_STS\)](#) indicates when the command is finished. The [Switch Engine VLAN Read Data Register \(SWE_VLAN_RD_DATA\)](#) can then be read.

For a write access, the [Switch Engine VLAN Write Data Register \(SWE_VLAN_WR_DATA\)](#) register should be written first. The Operation Pending bit in the [Switch Engine VLAN Command Status Register \(SWE_VLAN_CMD_STS\)](#) indicates when the command is finished.

BITS	DESCRIPTION	TYPE	DEFAULT
31:6	RESERVED	RO	-
5	VLAN RnW This bit specifies a read(1) or a write(0) command.	R/W	0b
4	PVIDnVLAN When set, this bit selects the Port VID table. When cleared, this bit selects the VLAN table.	R/W	0b
3:0	VLAN/Port This field specifies the VLAN(0-15) or port(0-2) to be read or written. Note: Values outside of the valid range may cause unexpected results.	R/W	0h

13.3.3.9 Switch Engine VLAN Write Data Register (SWE_VLAN_WR_DATA)

Register #: 180Ch Size: 32 bits

This register is used write the VLAN or Port VID tables.

BITS	DESCRIPTION	TYPE	DEFAULT

13.3.3.11 Switch Engine VLAN Command Status Register (SWE_VLAN_CMD_STS)

Register #: 1810h Size: 32 bits

This register indicates the current VLAN command status.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Operation Pending When set, this bit indicates that the read or write command is taking place. This bit is cleared once the command has finished.	RO SC	0b

Datasheet**13.3.3.12 Switch Engine DIFFSERV Table Command Register (SWE_DIFFSERV_TBL_CFG)**

Register #: 1811h Size: 32 bits

This register is used to read and write the DIFFSERV table. A write to this address performs the specified access. This table is used to map the received IP ToS/CS to a priority.

For a read access, the Operation Pending bit in the [Switch Engine DIFFSERV Table Command Status Register \(SWE_DIFFSERV_TBL_CMD_STS\)](#) indicates when the command is finished. The [Switch Engine DIFFSERV Table Read Data Register \(SWE_DIFFSERV_TBL_RD_DATA\)](#) can then be read.

For a write access, the [Switch Engine DIFFSERV Table Write Data Register \(SWE_DIFFSERV_TBL_WR_DATA\)](#) register should be written first. The Operation Pending bit in the [Switch Engine DIFFSERV Table Command Status Register \(SWE_DIFFSERV_TBL_CMD_STS\)](#) indicates when the command is finished.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7	DIFFSERV Table RnW This bit specifies a read(1) or a write(0) command.	R/W	0b
6	RESERVED	RO	-
5:0	DIFFSERV Table Index This field specifies the ToS/CS entry that is accessed.	R/W	0h

13.3.3.13 Switch Engine DIFFSERV Table Write Data Register (SWE_DIFFSERV_TBL_WR_DATA)

Register #: 1812h Size: 32 bits

This register is used to write the DIFFSERV table. The DIFFSERV table is not initialized upon reset on power-up. If DIFFSERV is enabled, the full table should be initialized by the host.

BITS	DESCRIPTION	TYPE	DEFAULT
31:3	RESERVED	RO	-
2:0	DIFFSERV Priority These bits specify the assigned receive priority for IP packets with a ToS/CS field that matches this index.	R/W	000b

Datasheet**13.3.3.14 Switch Engine DIFFSERV Table Read Data Register (SWE_DIFFSERV_TBL_RD_DATA)**

Register #: 1813h Size: 32 bits

This register is used to read the DIFFSERV table.

BITS	DESCRIPTION	TYPE	DEFAULT
31:3	RESERVED	RO	-
2:0	DIFFSERV Priority These bits specify the assigned receive priority for IP packets with a ToS/CS field that matches this index.	RO	000b

13.3.3.15 Switch Engine DIFFSERV Table Command Status Register (SWE_DIFFSERV_TBL_CMD_STS)

Register #: 1814h Size: 32 bits

This register indicates the current DIFFSERV command status.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Operation Pending When set, this bit indicates that the read or write command is taking place. This bit is cleared once the command has finished.	RO SC	0b

Datasheet

13.3.3.16 Switch Engine Global Ingress Configuration Register (SWE_GLOBAL_INGRSS_CFG)

Register #: 1840h Size: 32 bits

This register is used to configure the global ingress rules.

BITS	DESCRIPTION	TYPE	DEFAULT
31:14	RESERVED	RO	-
13	<p>Allow Snoop Echo When set, snooped packets are allowed to be echoed back to the source port. When cleared, snooped packets, like other packets, are never sent back to the source port.</p> <p>This bit is useful when the snoop port wishes to receive it's own MLD/IGMP packets.</p>	R/W	0b
12:10	<p>MLD/IGMP Snoop Port This field is the port bit map where IPv6 MLD packets and IPv4 IGMP packets are sent.</p>	R/W	0b
9	<p>Use IP When set, the IPv4 TOS or IPv6 SC field is enabled as a transmit priority queue choice.</p>	R/W	0b
8	<p>Enable MLD Snooping When set, IPv6 Multicast Listening Discovery packets are snooped and sent to the MLD/IGMP snoop port.</p>	R/W	0b
7	<p>Enable IGMP Snooping When set, IPv4 IGMP packets are snooped and sent to the MLD/IGMP snoop port.</p>	R/W	0b
6	<p>SWE Counter Test When this bit is set the Switch Engine counters that normally clear to 0 when read will be set to 7FFF_FFFCh when read.</p>	R/W	0b
5	<p>DA Highest Priority When this bit is set and the Static bit in the ALR table for the destination MAC address is set, the transmit priority queue that is selected is taken from the ALR Priority bits (see the Switch Engine ALR Read Data 1 Register (SWE_ALR_RD_DAT_1)).</p>	R/W	0b
4	<p>Filter Multicast When this bit is set, packets with a multicast destination address are filtered if the address is not found in the ALR table. Broadcasts are not included in this filter.</p>	R/W	0b
3	<p>Drop Unknown When this bit is set, packets with a unicast destination address are filtered if the address is not found in the ALR table.</p>	R/W	0b
2	<p>Use Precedence When the priority is taken from an IPV4 packet (enabled via the Use IP bit), this bit selects between precedence bits in the TOS octet or the DIFFSERV table.</p> <p>When set, IPv4 packets will use the precedence bits in the TOS octet to select the transmit priority queue. When cleared, IPv4 packets will use the DIFFSERV table to select the transmit priority queue.</p>	R/W	1b

BITS	DESCRIPTION	TYPE	DEFAULT
1	VL Higher Priority When this bit is set and VLANs are enabled, the priority from the VLAN tag has higher priority than the IP TOS/SC field.	R/W	1b
0	VLAN Enable When set, VLAN ingress rules are enabled. This also enables the VLAN to be used as the transmit priority queue selection.	R/W	0b

Datasheet**13.3.3.17 Switch Engine Port Ingress Configuration Register (SWE_PORT_INGRSS_CFG)**

Register #: 1841h Size: 32 bits

This register is used to configure the per port ingress rules.

BITS	DESCRIPTION	TYPE	DEFAULT
31:6	RESERVED	RO	-
5:3	<p>Enable Learning on Ingress When set, source addresses are learned when a packet is received on the corresponding port and the corresponding Port State in the Switch Engine Port State Register (SWE_PORT_STATE) is set to forwarding or learning.</p> <p>There is one enable bit per ingress port. Bits 5,4,3 correspond to switch ports 2,1,0 respectively.</p>	R/W	111b
2:0	<p>Enable Membership Checking When set, VLAN membership is checked when a packet is received on the corresponding port.</p> <p>The packet will be filtered if the ingress port is not a member of the VLAN (unless the Admit Non Member bit is set for the port in the Switch Engine Admit Non Member Register (SWE_ADMT_N_MEMBER))</p> <p>For destination addresses that are found in the ALR table, the packet will be filtered if the egress port is not a member of the VLAN (for destination addresses that are not found in the ALR table only the ingress port is checked for membership).</p> <p>The VLAN Enable bit in the Switch Engine Global Ingress Configuration Register (SWE_GLOBAL_INGRSS_CFG) needs to be set for these bits to have an affect.</p> <p>There is one enable bit per ingress port. Bits 2,1,0 correspond to switch ports 2,1,0 respectively.</p>	R/W	000b

13.3.3.18 Switch Engine Admit Only VLAN Register (SWE_ADMT_ONLY_VLAN)

Register #: 1842h Size: 32 bits

This register is used to configure the per port ingress rule for allowing only VLAN tagged packets.

BITS	DESCRIPTION	TYPE	DEFAULT
31:3	RESERVED	RO	-
2:0	<p>Admit Only VLAN When set, untagged and priority tagged packets are filtered.</p> <p>The VLAN Enable bit in the Switch Engine Global Ingress Configuration Register (SWE_GLOBAL INGRSS_CFG) needs to be set for these bits to have an affect.</p> <p>There is one enable bit per ingress port. Bits 2,1,0 correspond to switch ports 2,1,0 respectively.</p>	R/W	000b

Datasheet**13.3.3.19 Switch Engine Port State Register (SWE_PORT_STATE)**

Register #: 1843h Size: 32 bits

This register is used to configure the per port spanning tree state.

BITS	DESCRIPTION	TYPE	DEFAULT
31:6	RESERVED	RO	-
5:4	Port State Port 2 These bits specify the spanning tree port states for Port 2. 00 = Forwarding 01 = Blocking 10 = Learning 11 = Listening	R/W	00b
3:2	Port State Port 1 These bits specify the spanning tree port states for Port 1. 00 = Forwarding 01 = Blocking 10 = Learning 11 = Listening	R/W	00b
1:0	Port State Port 0 These bits specify the spanning tree port states for Port 0(External MII). 00 = Forwarding 01 = Blocking 10 = Learning 11 = Listening	R/W	00b

13.3.3.20 Switch Engine Priority to Queue Register (SWE_PRI_TO_QUE)

Register #: 1845h Size: 32 bits

This register specifies the Traffic Class table that maps the packet priority into the egress queues.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:14	Priority 7 traffic Class These bits specify the egress queue that is used for packets with a priority of 7.	R/W	11b
13:12	Priority 6 traffic Class These bits specify the egress queue that is used for packets with a priority of 6.	R/W	11b
11:10	Priority 5 traffic Class These bits specify the egress queue that is used for packets with a priority of 5.	R/W	10b
9:8	Priority 4 traffic Class These bits specify the egress queue that is used for packets with a priority of 4.	R/W	10b
7:6	Priority 3 traffic Class These bits specify the egress queue that is used for packets with a priority of 3.	R/W	01b
5:4	Priority 2 traffic Class These bits specify the egress queue that is used for packets with a priority of 2.	R/W	00b
3:2	Priority 1 traffic Class These bits specify the egress queue that is used for packets with a priority of 1.	R/W	00b
1:0	Priority 0 traffic Class These bits specify the egress queue that is used for packets with a priority of 0.	R/W	01b

Datasheet**13.3.3.21 Switch Engine Port Mirroring Register (SWE_PORT_MIRROR)**

Register #: 1846h Size: 32 bits

This register is used to configure port mirroring.

BITS	DESCRIPTION	TYPE	DEFAULT
31:9	RESERVED	RO	-
8	<p>Enable RX Mirroring Filtered When set, packets that would normally have been filtered are included in the receive mirroring function and are sent only to the sniffer port. When cleared, filtered packets are not mirrored.</p> <p>Note: The Ingress Filtered Count Registers will still count these packets as filtered and the Switch Engine Interrupt Pending Register (SWE_IPR) will still register a drop interrupt.</p>	R/W	0b
7:5	<p>Sniffer Port These bits specify the sniffer port that transmits packets that are monitored. Bits 7,6,5 correspond to switch ports 2,1,0 respectively.</p> <p>Note: Only one port should be set as the sniffer.</p>	R/W	00b
4:2	<p>Mirrored Port These bits specify if a port is to be mirrored. Bits 4,3,2 correspond to switch ports 2,1,0 respectively.</p> <p>Note: Multiple ports can be set as mirrored.</p>	R/W	00b
1	<p>Enable RX Mirroring This bit enables packets received on the mirrored ports to be also sent to the sniffer port.</p>	R/W	0b
0	<p>Enable TX Mirroring This bit enables packets transmitted on the mirrored ports to be also sent to the sniffer port.</p>	R/W	0b

13.3.3.22 Switch Engine Ingress Port Type Register (SWE_INGRSS_PORT_TYP)

Register #: 1847h Size: 32 bits

This register is used to enable the special tagging mode used to determine the destination port based on the VLAN tag contents.

BITS	DESCRIPTION	TYPE	DEFAULT
31:6	RESERVED	RO	-
5:4	Ingress Port Type Port 2 A setting of 11b enables the usage of the VLAN tag to specify the packet destination. All other values disable this feature.	R/W	00b
3:2	Ingress Port Type Port 1 A setting of 11b enables the usage of the VLAN tag to specify the packet destination. All other values disable this feature.	R/W	00b
1:0	Ingress Port Type Port 0 A setting of 11b enables the usage of the VLAN tag to specify the packet destination. All other values disable this feature.	R/W	00b

Datasheet**13.3.3.23 Switch Engine Broadcast Throttling Register (SWE_BCST_THROT)**

Register #: 1848h Size: 32 bits

This register configures the broadcast input rate throttling.

BITS	DESCRIPTION	TYPE	DEFAULT
31:27	RESERVED	RO	-
26	Broadcast Throttle Enable Port 2 This bit enables broadcast input rate throttling on Port 2.	R/W	0b
25:18	Broadcast Throttle Level Port 2 These bits specify the number of bytes x 64 allowed to be received per every 1.72mS interval.	R/W	02h
17	Broadcast Throttle Enable Port 1 This bit enables broadcast input rate throttling on Port 1.	R/W	0b
16:9	Broadcast Throttle Level Port 1 These bits specify the number of bytes x 64 allowed to be received per every 1.72mS interval.	R/W	02h
8	Broadcast Throttle Enable Port 0 This bit enables broadcast input rate throttling on Port 0(External MII).	R/W	0b
7:0	Broadcast Throttle Level Port 0 These bits specify the number of bytes x 64 allowed to be received per every 1.72mS interval.	R/W	02h

13.3.3.24 Switch Engine Admit Non Member Register (SWE_ADMT_N_MEMBER)

Register #: 1849h Size: 32 bits

This register is used to allow access to a VLAN even if the ingress port is not a member.

BITS	DESCRIPTION	TYPE	DEFAULT
31:3	RESERVED	RO	-
2:0	Admit Non Member When set, a received packet is accepted even if the ingress port is not a member of the destination VLAN. The VLAN still must be active in the switch. There is one bit per ingress port. Bits 2,1,0 correspond to switch ports 2,1,0 respectively.	R/W	000b

Datasheet**13.3.3.25 Switch Engine Ingress Rate Configuration Register (SWE_INGRSS_RATE_CFG)**

Register #: 184Ah Size: 32 bits

This register, along with the settings accessible via the [Switch Engine Ingress Rate Command Register \(SWE_INGRSS_RATE_CMD\)](#), is used to configure the ingress rate metering/coloring.

BITS	DESCRIPTION	TYPE	DEFAULT
31:3	RESERVED	RO	-
2:1	Rate Mode These bits configure the rate metering/coloring mode. 00 = Source Port & Priority 01 = Source Port Only 10 = Priority Only 11 = RESERVED	R/W	00b
0	Ingress Rate Enable When set, ingress rates are metered and packets are colored and dropped if necessary.	R/W	0b

13.3.3.26 Switch Engine Ingress Rate Command Register (SWE_INGRSS_RATE_CMD)

Register #: 184Bh Size: 32 bits

This register is used to indirectly read and write the ingress rate metering/color table registers. A write to this address performs the specified access.

For a read access, the Operation Pending bit in the [Switch Engine Ingress Rate Command Status Register \(SWE_INGRSS_RATE_CMD_STS\)](#) indicates when the command is finished. The [Switch Engine Ingress Rate Read Data Register \(SWE_INGRSS_RATE_RD_DATA\)](#) can then be read.

For a write access, the [Switch Engine Ingress Rate Write Data Register \(SWE_INGRSS_RATE_WR_DATA\)](#) should be written first. The Operation Pending bit in the [Switch Engine Ingress Rate Command Status Register \(SWE_INGRSS_RATE_CMD_STS\)](#) indicates when the command is finished.

For details on 16-bit wide Ingress Rate Table registers indirectly accessible by this register, see [Section 13.3.3.26.1](#) below.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7	Ingress Rate RnW These bits specify a read(1) or write(0) command.	R/W	0b
6:5	Type These bits select between the ingress rate metering/color table registers as follows: 00 = RESERVED 01 = Committed Information Rate Registers (uses CIS Address field) 10 = Committed Burst Register 11 = Excess Burst Register	R/W	00b
4:0	CIR Address These bits select one of the 24 Committed Information Rate registers. When Rate Mode is set to Source Port & Priority in the Switch Engine Ingress Rate Configuration Register (SWE_INGRSS_RATE_CFG) , the first set of 8 registers (CIR addresses 0-7) are for to Port 0, the second set of 8 registers (CIR addresses 8-15) are for Port 1, and the third set of registers (CIR addresses 16-23) are for Port 2. Priority 0 is the lower register of each set (e.g. 0, 8, and 16). When Rate Mode is set to Source Port Only, the first register (CIR address 0) is for Port 0, the second register (CIR address 1) is for Port 1, and the third register (CIR address 2) is for Port 2. When Rate Mode is set to Priority Only, the first register (CIR address 0) is for priority 0, the second register (CIR address 1) is for priority 1, and so forth up to priority 23. Note: Values outside of the valid range may cause unexpected results.	R/W	0h

Datasheet**13.3.3.26.1 INGRESS RATE TABLE REGISTERS**

The ingress rate metering/color table consists of 24 Committed Information Rate (CIR) registers (one per port/priority), a Committed Burst Size register, and an Excess Burst Size register. All metering/color table registers are 16-bits in size and are accessed indirectly via the [Switch Engine Ingress Rate Command Register \(SWE_INGRSS_RATE_CMD\)](#). Descriptions of these registers are detailed in [Table 13.13](#) below.

Table 13.13 Metering/Color Table Register Descriptions

DESCRIPTION	TYPE	DEFAULT
<p>Excess Burst Size This register specifies the maximum excess burst size in bytes. Bursts larger than this value that exceed the excess data rate are dropped.</p> <p>Note: Either this value or the Committed Burst Size should be set larger than or equal to the largest possible packet expected.</p> <p>Note: All of the Excess Burst token buckets are initialized to this default value. If a lower value is programmed into this register, the token buckets will need to be normally depleted below this value before this value has any affect on limiting the token bucket maximum values.</p> <p>This register is 16-bits wide.</p>	R/W	0600h
<p>Committed Burst Size This register specifies the maximum committed burst size in bytes. Bursts larger than this value that exceed the committed data rate are subjected to random dropping.</p> <p>Note: Either this value or the Excess Burst Size should be set larger than or equal to the largest possible packet expected.</p> <p>Note: All of the Committed Burst token buckets are initialized to this default value. If a lower value is programmed into this register, the token buckets will need to be normally depleted below this value before this value has any affect on limiting the token bucket maximum values.</p> <p>This register is 16-bits wide.</p>	R/W	0600h
<p>Committed Information Rate (CIR) These registers specify the committed data rate for the port/priority pair. The rate is specified in time per byte. The time is this value plus 1 times 20nS.</p> <p>There are 24 of these registers each 16-bits wide.</p>	R/W	0014h

13.3.3.27 Switch Engine Ingress Rate Command Status Register (SWE_INGRSS_RATE_CMD_STS)

Register #: 184Ch Size: 32 bits

This register indicates the current ingress rate command status.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Operation Pending When set, indicates that the read or write command is taking place. This bit is cleared once the command has finished.	RO SC	0b

Datasheet**13.3.3.28 Switch Engine Ingress Rate Write Data Register (SWE_INGRSS_RATE_WR_DATA)**

Register #: 184Dh Size: 32 bits

This register is used to write the ingress rate table registers.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:0	Data This is the data to be written to the ingress rate table registers as specified in the Switch Engine Ingress Rate Command Register (SWE_INGRSS_RATE_CMD) . Refer to Section 13.3.3.26.1, "Ingress Rate Table Registers," on page 341 for details on these registers.	R/W	0000h

13.3.3.29 Switch Engine Ingress Rate Read Data Register (SWE_INGRSS_RATE_RD_DATA)

Register #: 184Eh Size: 32 bits

This register is used to read the ingress rate table registers.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:0	Data This is the read data from the ingress rate table registers as specified in the Switch Engine Ingress Rate Command Register (SWE_INGRSS_RATE_CMD) . Refer to Section 13.3.3.26.1, "Ingress Rate Table Registers," on page 341 for details on these registers.	RO	0000h

Datasheet**13.3.3.30 Switch Engine Port 0 Ingress Filtered Count Register (SWE_FILTERED_CNT_MII)**

Register #: 1850h Size: 32 bits

This register counts the number of packets filtered at ingress on Port 0(External MII). This count includes packets filtered due to broadcast throttling but does not include packets dropped due to ingress rate limiting (which are counted separately).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Filtered This field is a count of packets filtered at ingress and is cleared when read. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

13.3.3.31 Switch Engine Port 1 Ingress Filtered Count Register (SWE_FILTERED_CNT_1)

Register #: 1851h Size: 32 bits

This register counts the number of packets filtered at ingress on Port 1. This count includes packets filtered due to broadcast throttling but does not include packets dropped due to ingress rate limiting (which are counted separately).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Filtered This field is a count of packets filtered at ingress and is cleared when read. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.3.32 Switch Engine Port 2 Ingress Filtered Count Register (SWE_FILTERED_CNT_2)**

Register #: 1852h Size: 32 bits

This register counts the number of packets filtered at ingress on Port 2. This count includes packets filtered due to broadcast throttling but does not include packets dropped due to ingress rate limiting (which are counted separately).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Filtered This field is a count of packets filtered at ingress and is cleared when read.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

13.3.3.33 Switch Engine Port 0 Ingress VLAN Priority Regeneration Table Register (SWE INGRSS_REGEN_TBL_MII)

Register #: 1855h Size: 32 bits

This register provides the ability to map the received VLAN priority to a regenerated priority. The regenerated priority is used in determining the output priority queue. By default, the regenerated priority is identical to the received priority.

BITS	DESCRIPTION	TYPE	DEFAULT
31:24	RESERVED	RO	-
23:21	Regen7 These bits specify the regenerated priority for received priority 7.	R/W	7h
20:18	Regen6 These bits specify the regenerated priority for received priority 6.	R/W	6h
17:15	Regen5 These bits specify the regenerated priority for received priority 5.	R/W	5h
14:12	Regen4 These bits specify the regenerated priority for received priority 4.	R/W	4h
11:9	Regen3 These bits specify the regenerated priority for received priority 3.	R/W	3h
8:6	Regen2 These bits specify the regenerated priority for received priority 2.	R/W	2h
5:3	Regen1 These bits specify the regenerated priority for received priority 1.	R/W	1h
2:0	Regen0 These bits specify the regenerated priority for received priority 0.	R/W	0h

Datasheet
**13.3.3.34 Switch Engine Port 1 Ingress VLAN Priority Regeneration Table Register
(SWE_INGRSS_REGEN_TBL_1)**

Register #: 1856h Size: 32 bits

This register provides the ability to map the received VLAN priority to a regenerated priority. The regenerated priority is used in determining the output priority queue. By default, the regenerated priority is identical to the received priority.

BITS	DESCRIPTION	TYPE	DEFAULT
31:24	RESERVED	RO	-
23:21	Regen7 These bits specify the regenerated priority for received priority 7.	R/W	7h
20:18	Regen6 These bits specify the regenerated priority for received priority 6.	R/W	6h
17:15	Regen5 These bits specify the regenerated priority for received priority 5.	R/W	5h
14:12	Regen4 These bits specify the regenerated priority for received priority 4.	R/W	4h
11:9	Regen3 These bits specify the regenerated priority for received priority 3.	R/W	3h
8:6	Regen2 These bits specify the regenerated priority for received priority 2.	R/W	2h
5:3	Regen1 These bits specify the regenerated priority for received priority 1.	R/W	1h
2:0	Regen0 These bits specify the regenerated priority for received priority 0.	R/W	0h

13.3.3.35 Switch Engine Port 2 Ingress VLAN Priority Regeneration Table Register (SWE INGRSS_REGEN_TBL_2)

Register #: 1857h Size: 32 bits

This register provides the ability to map the received VLAN priority to a regenerated priority. The regenerated priority is used in determining the output priority queue. By default, the regenerated priority is identical to the received priority.

BITS	DESCRIPTION	TYPE	DEFAULT
31:24	RESERVED	RO	-
23:21	Regen7 These bits specify the regenerated priority for received priority 7.	R/W	7h
20:18	Regen6 These bits specify the regenerated priority for received priority 6.	R/W	6h
17:15	Regen5 These bits specify the regenerated priority for received priority 5.	R/W	5h
14:12	Regen4 These bits specify the regenerated priority for received priority 4.	R/W	4h
11:9	Regen3 These bits specify the regenerated priority for received priority 3.	R/W	3h
8:6	Regen2 These bits specify the regenerated priority for received priority 2.	R/W	2h
5:3	Regen1 These bits specify the regenerated priority for received priority 1.	R/W	1h
2:0	Regen0 These bits specify the regenerated priority for received priority 0.	R/W	0h

Datasheet**13.3.3.36 Switch Engine Port 0 Learn Discard Count Register (SWE_LRN_DISCRD_CNT_MII)**

Register #: 1858h Size: 32 bits

This register counts the number of MAC addresses on Port 0(External MII) that were not learned or were overwritten by a different address due to address table space limitations.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Learn Discard This field is a count of MAC addresses not learned or overwritten and is cleared when read.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

13.3.3.37 Switch Engine Port 1 Learn Discard Count Register (SWE_LRN_DISCRD_CNT_1)

Register #: 1859h Size: 32 bits

This register counts the number of MAC addresses on Port 1 that were not learned or were overwritten by a different address due to address table space limitations.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Learn Discard This field is a count of MAC addresses not learned or overwritten and is cleared when read. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.3.38 Switch Engine Port 2 Learn Discard Count Register (SWE_LRN_DISCRD_CNT_2)**

Register #: 185Ah Size: 32 bits

This register counts the number of MAC addresses on Port 2 that were not learned or were overwritten by a different address due to address table space limitations.

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Learn Discard This field is a count of MAC addresses not learned or overwritten and is cleared when read.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

13.3.3.39 Switch Engine Interrupt Mask Register (SWE_IMR)

Register #: 1880h Size: 32 bits

This register contains the Switch Engine interrupt mask, which masks the interrupts in the [Switch Engine Interrupt Pending Register \(SWE_IPR\)](#). All Switch Engine interrupts are masked by setting the Interrupt Mask bit. Clearing this bit will unmask the interrupts. Refer to [Chapter 5, "System Interrupts," on page 52](#) for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Interrupt Mask When set, this bit masks interrupts from the Switch Engine. The status bits in the Switch Engine Interrupt Pending Register (SWE_IPR) are not affected.	R/W	1b

Datasheet

13.3.3.40 Switch Engine Interrupt Pending Register (SWE_IPR)

Register #: 1881h Size: 32 bits

This register contains the Switch Engine interrupt status. The status is double buffered. All interrupts in this register may be masked via the [Switch Engine Interrupt Mask Register \(SWE_IMR\)](#) register. Refer to [Chapter 5, "System Interrupts,"](#) on page 52 for more information.

1111	RESERVED																																				

BITS	DESCRIPTION	TYPE	DEFAULT
10:9	Source Port B When bit 8 is set, these bits indicate the source port on which the packet was dropped. 00 = Port 0 01 = Port 1 10 = Port 2 11 = RESERVED	RC	00b
8	Set B Valid When set, bits 14:9 are valid.	RC	0b
7:4	Drop Reason A When bit 1 is set, these bits indicate the reason a packet was dropped. See the Drop Reason B description above for definitions of each value of this field.	RC	0h
3:2	Source port A When bit 1 is set, these bits indicate the source port on which the packet was dropped. 00 = Port 0 01 = Port 1 10 = Port 2 11 = RESERVED	RC	00b
1	Set A Valid When set, bits 7:2 are valid.	RC	0b
0	Interrupt Pending When set, a packet dropped event(s) is indicated.	RC	0b

Datasheet

13.3.4 Buffer Manager CSRs

This section details the Buffer Manager (BM) registers. These registers allow configuration and monitoring of the switch buffer levels and usage. A list of the general switch CSRs and their corresponding register numbers is included in [Table 13.12](#).

13.3.4.1 Buffer Manager Configuration Register (BM_CFG)

Register #: 1C00h Size: 32 bits

This register enables egress rate pacing and ingress rate discarding.

BITS	DESCRIPTION	TYPE	DEFAULT
31:7	RESERVED	RO	-
6	BM Counter Test When this bit is set, Buffer Manager (BM) counters that normally clear to 0 when read, will be set to 7FFF_FFFC when read.	R/W	0b
5	Fixed Priority Queue Servicing When set, output queues are serviced with a fixed priority ordering. When cleared, output queues are serviced with a weighted round robin ordering.	R/W	0b
4:2	Egress Rate Enable When set, egress rate pacing is enabled. Bits 4,3,2 correspond to switch ports 2,1,0 respectively.	R/W	0b
1	Drop on Yellow When this bit is set, packets that exceed the Ingress Committed Burst Size (colored Yellow) are subjected to random discard. Note: See Section 13.3.3.26, "Switch Engine Ingress Rate Command Register (SWE_INGRSS_RATE_CMD)," on page 340 for information on configuring the Ingress Committed Burst Size.	R/W	0b
0	Drop on Red When this bit is set, packets that exceed the Ingress Excess Burst Size (colored Red) are discarded. Note: See Section 13.3.3.26, "Switch Engine Ingress Rate Command Register (SWE_INGRSS_RATE_CMD)," on page 340 for information on configuring the Ingress Excess Burst Size.	R/W	0b

13.3.4.2 Buffer Manager Drop Level Register (BM_DROP_LVL)

Register #: 1C01h Size: 32 bits

This register configures the overall buffer usage limits.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:8	Drop Level Low These bits specify the buffer limit that can be used per ingress port during times when 2 or 3 ports are active. Each buffer is 128 bytes. Note: A port is “active” when 36 buffers are in use for that port.	R/W	49h
7:0	Drop Level High These bits specify the buffer limit that can be used per ingress port during times when 1 port is active. Each buffer is 128 bytes. Note: A port is “active” when 36 buffers are in use for that port.	R/W	64h

Datasheet**13.3.4.3 Buffer Manager Flow Control Pause Level Register (BM_FC_PAUSE_LVL)**

Register #: 1C02h Size: 32 bits

This register configures the buffer usage level when a Pause frame or backpressure is sent.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:8	<p>Pause Level Low These bits specify the buffer usage level during times when 2 or 3 ports are active.</p> <p>Each buffer is 128 bytes.</p> <p>Note: A port is "active" when 36 buffers are in use for that port.</p>	R/W	21h
7:0	<p>Pause Level High These bits specify the buffer usage level during times when 1 port is active.</p> <p>Each buffer is 128 bytes.</p> <p>Note: A port is "active" when 36 buffers are in use for that port.</p>	R/W	3Ch

13.3.4.4 Buffer Manager Flow Control Resume Level Register (BM_FC_RESUME_LVL)

Register #: 1C03h Size: 32 bits

This register configures the buffer usage level when a Pause frame with a pause value of 1 is sent.

BITS	DESCRIPTION	TYPE	DEFAULT
31:16	RESERVED	RO	-
15:8	Resume Level Low These bits specify the buffer usage level during times when 2 or 3 ports are active. Each buffer is 128 bytes. Note: A port is “active” when 36 buffers are in use for that port.	R/W	03h
7:0	Resume Level High These bits specify the buffer usage level during times when 0 or 1 ports are active. Each buffer is 128 bytes. Note: A port is “active” when 36 buffers are in use for that port.	R/W	07h

Datasheet**13.3.4.5 Buffer Manager Broadcast Buffer Level Register (BM_BCST_LVL)**

Register #: 1C04h Size: 32 bits

This register configures the buffer usage limits for broadcasts, multicasts, and unknown unicasts.

BITS	DESCRIPTION	TYPE	DEFAULT
31:8	RESERVED	RO	-
7:0	Broadcast Drop Level These bits specify the maximum number of buffers that can be used by broadcasts, multicasts, and unknown unicasts. Each buffer is 128 bytes.	R/W	31h

13.3.4.6 Buffer Manager Port 0 Drop Count Register (BM_DRP_CNT_SRC_MII)

Register #: 1C05h Size: 32 bits

This register counts the number of packets dropped by the Buffer Manager that were received on Port 0(External MII). This count includes packets dropped due to buffer space limits and ingress rate limit discarding (Red and random Yellow dropping).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Dropped Count These bits count the number of dropped packets received on Port 0 and is cleared when read. Note: The counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.4.7 Buffer Manager Port 1 Drop Count Register (BM_DRP_CNT_SRC_1)**

Register #: 1C06h Size: 32 bits

This register counts the number of packets dropped by the Buffer Manager that were received on Port 1. This count includes packets dropped due to buffer space limits and ingress rate limit discarding (Red and random Yellow dropping).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Dropped Count These bits count the number of dropped packets received on Port 1 and is cleared when read.</p> <p>Note: The counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

13.3.4.8 Buffer Manager Port 2 Drop Count Register (BM_DRP_CNT_SRC_2)

Register #: 1C07h Size: 32 bits

This register counts the number of packets dropped by the Buffer Manager that were received on Port 2. This count includes packets dropped due to buffer space limits and ingress rate limit discarding (Red and random Yellow dropping).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Dropped Count These bits count the number of dropped packets received on Port 2 and is cleared when read. Note: The counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.4.9 Buffer Manager Reset Status Register (BM_RST_STS)**

Register #: 1C08h Size: 32 bits

This register indicates when the Buffer Manager has been initialized by the reset process.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	BM Ready When set, indicates the Buffer Manager tables have finished being initialized by the reset process. The initialization is performed upon any reset that resets the switch fabric.	RO SS	Note 13.65

Note 13.65 The default value of this bit is 0 immediately following any switch fabric reset and then self-sets to 1 once the ALR table is initialized.

13.3.4.10 Buffer Manager Random Discard Table Command Register (BM_RNDM_DSCRD_TBL_CMD)

Register #: 1C09h Size: 32 bits

This register is used to read and write the Random Discard Weight table. A write to this address performs the specified access. This table is used to set the packet drop probability verses the buffer usage.

For a read access, the [Buffer Manager Random Discard Table Read Data Register \(BM_RNDM_DSCRD_TBL_RDATA\)](#) can be read following a write to this register.

For a write access, the [Buffer Manager Random Discard Table Write Data Register \(BM_RNDM_DSCRD_TBL_WDATA\)](#) should be written before writing this register.

BITS	DESCRIPTION	TYPE	DEFAULT																																		
31:5	RESERVED	RO	-																																		
4	Random Discard Weight Table RnW Specifies a read (1) or a write (0) command.	R/W	0b																																		
3:0	Random Discard Weight Table Index Specifies the buffer usage range that is accessed. There are a total of 16 probability entries. Each entry corresponds to a range of the number of buffers used by the ingress port. The ranges are structured to give more resolution towards the lower buffer usage end.	R/W	0h

Datasheet**13.3.4.11 Buffer Manager Random Discard Table Write Data Register (BM_RNDM_DSCRD_TBL_WDATA)**

Register #: 1C0Ah Size: 32 bits

This register is used to write the Random Discard Weight table.

Note: The Random Discard Weight table is not initialized upon reset or power-up. If a random discard is enabled, the full table should be initialized by the host.

BITS	DESCRIPTION	TYPE	DEFAULT
31:10	RESERVED	RO	-
9:0	<p>Drop Probability These bits specify the discard probability of a packet that has been colored Yellow by the ingress metering. The probability is given in 1/1024's. For example, a setting of 1 is one in 1024, or approximately 0.1%. A setting of all ones (1023) is 1023 in 1024, or approximately 99.9%.</p> <p>There are a total of 16 probability entries. Each entry corresponds to a range of the number of buffers used by the ingress port, as specified in Section 13.3.4.10, "Buffer Manager Random Discard Table Command Register (BM_RNDM_DSCRD_TBL_CMD)".</p>	R/W	000h

13.3.4.12 Buffer Manager Random Discard Table Read Data Register (BM_RNDM_DSCRD_TBL_RDATA)

Register #: 1C0Bh Size: 32 bits

This register is used to read the Random Discard Weight table.

BITS	DESCRIPTION	TYPE	DEFAULT
31:10	RESERVED	RO	-

Datasheet

13.3.4.13 Buffer Manager Egress Port Type Register (BM_EGRSS_PORT_TYPE)

Register #: 1C0Ch Size: 32 bits

This register is used to configure the egress VLAN tagging rules. See [Section 6.5.6, "Adding, Removing, and Changing VLAN Tags," on page 80](#) for additional details.

BITS	DESCRIPTION	TYPE	DEFAULT
31:22	RESERVED	RO	-
21	<p>Insert Tag Port 2 When set, untagged packets will have a tag added that contains the Default VLAN ID and Priority of the <i>ingress</i> port.</p> <p>The un-tag bit in the VLAN table for the default VLAN ID also needs to be cleared in order for the tag to be inserted.</p> <p>This is only used when the Egress Port Type is set as Hybrid.</p>	R/W	0b
20	<p>Change VLAN ID Port 2 When set, regular tagged packets will have their VLAN ID overwritten with the Default VLAN ID of the <i>egress</i> port.</p> <p>The Change Tag bit also needs to be set.</p> <p>The un-tag bit in the VLAN table for the incoming VLAN ID also needs to be cleared, otherwise the tag will be removed instead.</p> <p>Priority tagged packets will have VLAN ID overwritten with the Default VLAN ID of the <i>ingress</i> port independent of this bit.</p> <p>This is only used when the Egress Port Type is set as Hybrid.</p>	R/W	0b
19	<p>Change Priority Port 2 When set, regular tagged packets will have their Priority overwritten with the Default Priority of the <i>egress</i> port. Priority tagged packets will have VLAN ID overwritten with the Default VLAN ID of the <i>ingress</i> port.</p> <p>For regular tagged packets, the Change Tag bit also needs to be set.</p> <p>The un-tag bit in the VLAN table for the incoming VLAN ID also needs to be cleared, otherwise the tag would be removed instead.</p> <p>This is only used when the Egress Port Type is set as Hybrid.</p>	R/W	0b
18	<p>Change Tag Port 2 When set, allows the Change Tag and Change Priority bits to affect regular tagged packets.</p> <p>This bit has no affect on priority tagged packets.</p> <p>This is only used when the Egress Port Type is set as Hybrid.</p>	R/W	0b

Datasheet**13.3.4.14 Buffer Manager Port 0 Egress Rate Priority Queue 0/1 Register (BM_EGRSS_RATE_00_01)**

Register #: 1C0Dh Size: 32 bits

This register, along with the [Buffer Manager Configuration Register \(BM_CFG\)](#), is used to configure the egress rate pacing.

BITS	DESCRIPTION	TYPE	DEFAULT
31:26	RESERVED	RO	-
25:13	Egress Rate Port 0 Priority Queue 1 These bits specify the egress data rate for the Port 0(External MII) priority queue 1. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h
12:0	Egress Rate Port 0 Priority Queue 0 These bits specify the egress data rate for the Port 0(External MII) priority queue 0. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h

13.3.4.15 Buffer Manager Port 0 Egress Rate Priority Queue 2/3 Register (BM_EGRSS_RATE_02_03)

Register #: 1C0Eh Size: 32 bits

This register, along with the [Buffer Manager Configuration Register \(BM_CFG\)](#), is used to configure the egress rate pacing.

BITS	DESCRIPTION	TYPE	DEFAULT
31:26	RESERVED	RO	-
25:13	Egress Rate Port 0 Priority Queue 3 These bits specify the egress data rate for the Port 0(External MII) priority queue 3. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h
12:0	Egress Rate Port 0 Priority Queue 2 These bits specify the egress data rate for the Port 0(External MII) priority queue 2. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h

Datasheet**13.3.4.16 Buffer Manager Port 1 Egress Rate Priority Queue 0/1 Register (BM_EGRSS_RATE_10_11)**

Register #: 1C0Fh Size: 32 bits

This register, along with the [Buffer Manager Configuration Register \(BM_CFG\)](#), is used to configure the egress rate pacing.

BITS	DESCRIPTION	TYPE	DEFAULT
31:26	RESERVED	RO	-
25:13	Egress Rate Port 1 Priority Queue 1 These bits specify the egress data rate for the Port 1 priority queue 1. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h
12:0	Egress Rate Port 1 Priority Queue 0 These bits specify the egress data rate for the Port 1 priority queue 0. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h

13.3.4.17 Buffer Manager Port 1 Egress Rate Priority Queue 2/3 Register (BM_EGRSS_RATE_12_13)

Register #: 1C10h Size: 32 bits

This register, along with the [Buffer Manager Configuration Register \(BM_CFG\)](#), is used to configure the egress rate pacing.

BITS	DESCRIPTION	TYPE	DEFAULT
31:26	RESERVED	RO	-
25:13	Egress Rate Port 1 Priority Queue 3 These bits specify the egress data rate for the Port 1 priority queue 3. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h
12:0	Egress Rate Port 1 Priority Queue 2 These bits specify the egress data rate for the Port 1 priority queue 2. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h

Datasheet**13.3.4.18 Buffer Manager Port 2 Egress Rate Priority Queue 0/1 Register (BM_EGRSS_RATE_20_21)**

Register #: 1C11h Size: 32 bits

This register, along with the [Buffer Manager Configuration Register \(BM_CFG\)](#), is used to configure the egress rate pacing.

BITS	DESCRIPTION	TYPE	DEFAULT
31:26	RESERVED	RO	-
25:13	Egress Rate Port 2 Priority Queue 1 These bits specify the egress data rate for the Port 2 priority queue 1. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h
12:0	Egress Rate Port 2 Priority Queue 0 These bits specify the egress data rate for the Port 2 priority queue 0. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h

13.3.4.19 Buffer Manager Port 2 Egress Rate Priority Queue 2/3 Register (BM_EGRSS_RATE_22_23)

Register #: 1C12h Size: 32 bits

This register, along with the [Buffer Manager Configuration Register \(BM_CFG\)](#), is used to configure the egress rate pacing.

BITS	DESCRIPTION	TYPE	DEFAULT
31:26	RESERVED	RO	-
25:13	Egress Rate Port 2 Priority Queue 3 These bits specify the egress data rate for the Port 2 priority queue 3. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h
12:0	Egress Rate Port 2 Priority Queue 2 These bits specify the egress data rate for the Port 2 priority queue 2. The rate is specified in time per byte. The time is this value plus 1 times 20nS.	R/W	00000h

Datasheet**13.3.4.20 Buffer Manager Port 0 Default VLAN ID and Priority Register (BM_VLAN_MII)**

Register #: 1C13h Size: 32 bits

This register is used to specify the default VLAN ID and priority of Port 0(External MII).

BITS	DESCRIPTION	TYPE	DEFAULT
31:15	RESERVED	RO	-
14:12	Default Priority These bits specify the default priority that is used when a tag is inserted or changed on egress.	R/W	000b
11:0	Default VLAN ID These bits specify the default that is used when a tag is inserted or changed on egress.	R/W	000h

13.3.4.21 Buffer Manager Port 1 Default VLAN ID and Priority Register (BM_VLAN_1)

Register #: 1C14h Size: 32 bits

This register is used to specify the default VLAN ID and priority of Port 1.

BITS	DESCRIPTION	TYPE	DEFAULT
31:15	RESERVED	RO	-
14:12	Default Priority These bits specify the default priority that is used when a tag is inserted or changed on egress.	R/W	000b
11:0	Default VLAN ID These bits specify the default that is used when a tag is inserted or changed on egress.	R/W	000h

Datasheet**13.3.4.22 Buffer Manager Port 2 Default VLAN ID and Priority Register (BM_VLAN_2)**

Register #: 1C15h Size: 32 bits

This register is used to specify the default VLAN ID and priority of Port 2.

BITS	DESCRIPTION	TYPE	DEFAULT
31:15	RESERVED	RO	-
14:12	Default Priority These bits specify the default priority that is used when a tag is inserted or changed on egress.	R/W	000b

13.3.4.23 Buffer Manager Port 0 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_MII)

Register #: 1C16h Size: 32 bits

This register counts the number of packets received on Port 0(External MII) that were dropped by the Buffer Manager due to ingress rate limit discarding (Red and random Yellow dropping).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Dropped Count These bits count the number of dropped packets received on Port 0(External MII) and is cleared when read. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.4.24 Buffer Manager Port 1 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_1)**

Register #: 1C17h Size: 32 bits

This register counts the number of packets received on Port 1 that were dropped by the Buffer Manager due to ingress rate limit discarding (Red and random Yellow dropping).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	<p>Dropped Count These bits count the number of dropped packets received on Port 1 and is cleared when read.</p> <p>Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.</p>	RC	00000000h

13.3.4.25 Buffer Manager Port 2 Ingress Rate Drop Count Register (BM_RATE_DRP_CNT_SRC_2)

Register #: 1C18h Size: 32 bits

This register counts the number of packets received on Port 2 that were dropped by the Buffer Manager due to ingress rate limit discarding (Red and random Yellow dropping).

BITS	DESCRIPTION	TYPE	DEFAULT
31:0	Dropped Count These bits count the number of dropped packets received on Port 2 and is cleared when read. Note: This counter will stop at its maximum value of FFFF_FFFFh. Minimum rollover time at 100Mbps is approximately 481 hours.	RC	00000000h

Datasheet**13.3.4.26 Buffer Manager Interrupt Mask Register (BM_IMR)**

Register #: 1C20h Size: 32 bits

This register contains the Buffer Manager interrupt mask, which masks the interrupts in the [Buffer Manager Interrupt Pending Register \(BM_IPR\)](#). All Buffer Manager interrupts are masked by setting the Interrupt Mask bit. Clearing this bit will unmask the interrupts. Refer to [Chapter 5, "System Interrupts,"](#) on page 52 for more information.

BITS	DESCRIPTION	TYPE	DEFAULT
31:1	RESERVED	RO	-
0	Interrupt Mask When set, this bit masks interrupts from the Buffer Manager. The status bits in the Buffer Manager Interrupt Pending Register (BM_IPR) are not affected.	R/W	1b

13.3.4.27 Buffer Manager Interrupt Pending Register (BM_IPR)

Register #: 1C21h Size: 32 bits

This register contains the Buffer Manager interrupt status. The status is double buffered. All interrupts in this register may be masked via the [Buffer Manager Interrupt Mask Register \(BM_IMR\)](#) register. Refer to [Chapter 5, "System Interrupts,"](#) on page 52 for more information.

Chapter 14 Operational Characteristics

14.1 Absolute Maximum Ratings*

Supply Voltage (VDD33A1, VDD33A2, VDD33BIAS, VDD33IO) (Note 14.1)	0V to +3.6V
Positive voltage on signal pins, with respect to ground (Note 14.2)	+6V
Negative voltage on signal pins, with respect to ground (Note 14.3)	-0.5V
Positive voltage on XI, with respect to ground	+4.6V
Positive voltage on XO, with respect to ground	+2.5V
Ambient Operating Temperature in Still Air (T_A)	Note 14.4
Storage Temperature	-55°C to +150°C
Lead Temperature Range	Refer to JEDEC Spec. J-STD-020
HBM ESD Performance	+/- 5kV

Note 14.1 When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested that a clamp circuit be used.

Note 14.2 This rating does not apply to the following pins: XI, XO, EXRES.

Note 14.3 This rating does not apply to the following pins: EXRES.

Note 14.4 0°C to +70°C for commercial version (LAN9313), -40°C to +85°C for industrial version (LAN9313i)

*Stresses exceeding those listed in this section could cause permanent damage to the device. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at any condition exceeding those indicated in Section 14.2, "Operating Conditions**", Section 14.4, "DC Specifications", or any other applicable section of this specification is not implied. Note, device signals are *NOT* 5 volt tolerant.

14.2 Operating Conditions**

Supply Voltage (VDD33A1, VDD33A2, VDD33BIAS, VDD33IO)	+3.3V +/- 300mV
Ambient Operating Temperature in Still Air (T_A)	Note 14.4

**Proper operation of the LAN9313/LAN9313i is guaranteed only within the ranges specified in this section.

14.3 Power Consumption

This section details the power consumption of the LAN9313/LAN9313i. Power consumption values are provided for both the device-only, and for the device plus the Ethernet components on ports 1 and 2.

Table 14.1 Supply and Current (10BASE-T Full-Duplex)

PARAMETER	TYPICAL (@ 3.3V)	MAXIMUM (@ 3.6V)	UNIT
Supply current at 3.3V (VDD33A1, VDD33A2, VDD33BIAS, VDD33IO)	135	155	mA
Power Dissipation (Device Only)	445	565	mW
Power Dissipation (Device and Ethernet components)	1140	1330	mW
Ambient Operating Temperature in Still Air (T _A)	25	Note 14.5	°C

Table 14.2 Supply and Current (100BASE-TX Full-Duplex)

PARAMETER	TYPICAL (@ 3.3V)	MAXIMUM (@ 3.6V)	UNIT
Supply current (VDD33A1, VDD33A2, VDD33BIAS, VDD33IO)	230	270	mA
Power Dissipation (Device Only)	760	980	mW
Power Dissipation (Device and Ethernet components)	1045	1295	mW
Ambient Operating Temperature in Still Air (T _A)	25	Note 14.5	°C

Note 14.5 Over the conditions specified in [Section 14.2, "Operating Conditions**"](#).

Note: Power dissipation is determined by operating frequency, temperature, and supply voltage, as well as external source/sink current requirements.

14.4 DC Specifications

Table 14.3 I/O Buffer Characteristics

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
IS Type Input Buffer						
Low Input Level	V_{ILI}	-0.3			V	
High Input Level	V_{IHI}			3.6	V	
Negative-Going Threshold	V_{ILT}	1.01	1.18	1.35	V	Schmitt trigger
Positive-Going Threshold	V_{IHT}	1.39	1.6	1.8	V	Schmitt trigger
Schmitt Trigger Hysteresis ($V_{IHT} - V_{ILT}$)	V_{HYS}	345	420	485	mV	
Input Leakage	I_{IN}	-10		10	uA	Note 14.6
Input Capacitance	C_{IN}			3	pF	
O8 Type Buffers						
Low Output Level	V_{OL}			0.4	V	$I_{OL} = 8\text{mA}$
High Output Level	V_{OH}	$V_{DD33IO} - 0.4$			V	$I_{OH} = -8\text{mA}$
OD8 Type Buffer						
Low Output Level	V_{OL}			0.4	V	$I_{OL} = 8\text{mA}$
O12 Type Buffer						
Low Output Level	V_{OL}			0.4	V	$I_{OL} = 12\text{mA}$
High Output Level	V_{OH}	$V_{DD33IO} - 0.4$			V	$I_{OH} = -12\text{mA}$
OD12 Type Buffer						
Low Output Level	V_{OL}			0.4	V	$I_{OL} = 12\text{mA}$
ICLK Type Buffer (XI Input)						
Low Input Level	V_{ILI}	-0.3		0.5	V	Note 14.7
High Input Level	V_{IHI}	1.4		3.6	V	

Note 14.6 This specification applies to all IS type inputs and tri-stated bi-directional pins. Internal pull-down and pull-up resistors add +/- 50uA per-pin (typical).

Note 14.7 XI can optionally be driven from a 25MHz single-ended clock oscillator.

Table 14.4 100BASE-TX Transceiver Characteristics

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Peak Differential Output Voltage High	V_{PPH}	950	-	1050	mVpk	Note 14.8
Peak Differential Output Voltage Low	V_{PPL}	-950	-	-1050	mVpk	Note 14.8
Signal Amplitude Symmetry	V_{SS}	98	-	102	%	Note 14.8
Signal Rise and Fall Time	T_{RF}	3.0	-	5.0	nS	Note 14.8
Rise and Fall Symmetry	T_{RFS}	-	-	0.5	nS	Note 14.8
Duty Cycle Distortion	D_{CD}	35	50	65	%	Note 14.9

Table 14.4 100BASE-TX Transceiver Characteristics

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Overshoot and Undershoot	V_{OS}	-	-	5	%	
Jitter				1.4	nS	Note 14.10

Note 14.8 Measured at line side of transformer, line replaced by 100 Ω (+/- 1%) resistor.

Note 14.9 Offset from 16nS pulse width at 50% of pulse peak.

Note 14.10 Measured differentially.

Table 14.5 10BASE-T Transceiver Characteristics

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Transmitter Peak Differential Output Voltage	V_{OUT}	2.2	2.5	2.8	V	Note 14.11
Receiver Differential Squelch Threshold	V_{DS}	300	420	585	mV	

Note 14.11 Min/max voltages guaranteed as measured with 100 Ω resistive load.

14.5 AC Specifications

This section details the various AC timing specifications of the LAN9313/LAN9313i.

Note: The I²C timing adheres to the Philips *I²C-Bus Specification*. Refer to the Philips *I²C-Bus Specification* for detailed I²C timing information.

Note: The MII/SMI timing adheres to the IEEE 802.3 specification. Refer to the IEEE 802.3 specification for detailed MII timing information.

14.5.1 Equivalent Test Load

Output timing specifications assume the 25pF equivalent test load illustrated in [Figure 14.1](#) below.

**Figure 14.1 Output Equivalent Test Load**

14.5.2 Reset and Configuration Strap Timing

This diagram illustrates the nRST pin timing requirements and its relation to the configuration strap pins and output drive. Assertion of nRST is not a requirement. However, if used, it must be asserted for the minimum period specified. Please refer to [Section 4.2, "Resets," on page 41](#) for additional information.

Figure 14.2 nRST Reset Pin Timing

Table 14.6 nRST Reset Pin Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{rstia}	nRST input assertion time	200			μ S
t_{css}	Configuration strap pins setup to nRST deassertion	200			nS
t_{csh}	Configuration strap pins hold after nRST deassertion	10			nS
t_{odad}	Output drive after deassertion	30			nS

Note: Device configuration straps are latched as a result of nRST assertion. Refer to [Section 4.2.4, "Configuration Straps," on page 45](#) for details.

Datasheet

14.5.3 Power-On Configuration Strap Valid Timing

This diagram illustrates the configuration strap valid timing requirements in relation to power-on. In order for valid configuration strap values to be read at power-on, the following timing requirements must be met.

Figure 14.3 Power-On Configuration Strap Latching Timing

Table 14.7 Power-On Configuration Strap Latching Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{cfg}	Configuration strap valid time			15	mS

Note: Configuration straps must only be pulled high or low. Configuration straps must not be driven as inputs.

Note: Device configuration straps are also latched as a result of nRST assertion. Refer to [Section 14.5.2, "Reset and Configuration Strap Timing," on page 390](#) and [Section 4.2.4, "Configuration Straps," on page 45](#) for additional details.

14.5.4 Microwire Timing

This section specifies the Microwire EEPROM interface timing requirements. Please refer to [Section 8.2.3, "Microwire EEPROM,"](#) on page 108 for a functional description of this serial interface.

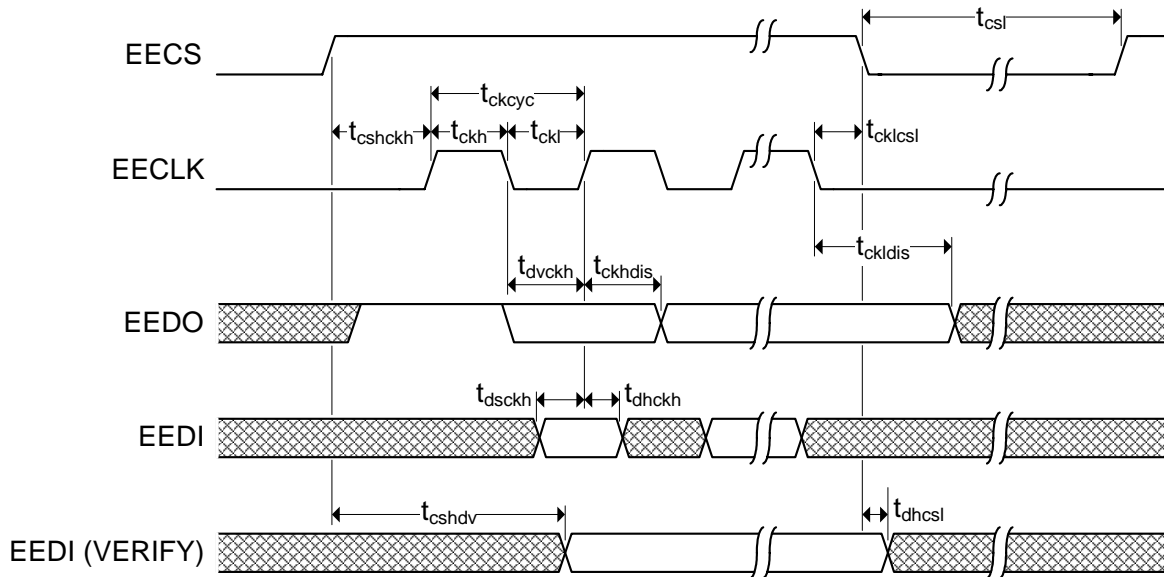

Figure 14.4 Microwire Timing

Table 14.8 Microwire Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{ckcyc}	EECLK cycle time	1110		1130	nS
t_{ckh}	EECLK high time	550		570	nS
t_{ckl}	EECLK low time	550		570	nS
t_{cshckh}	EECS high before rising edge of EECLK	1070			nS
t_{cklcsl}	EECLK falling edge to EECS low	30			nS
t_{dvckh}	EEDO valid before rising edge of EECLK	550			nS
t_{ckhdis}	EEDO disable after rising edge of EECLK	550			nS
t_{dsckh}	EEDI setup to rising edge of EECLK	90			nS
t_{dhckh}	EEDI hold after rising edge of EECLK	0			nS
t_{ckldis}	EECLK low to EEDO data disable	580			nS
t_{cshdv}	EEDI valid after EECS high (VERIFY)			600	nS
t_{dhcsl}	EEDI hold after EECS low (VERIFY)	0			nS
t_{csl}	EECS low	1070			nS

Datasheet

14.5.5 SPI Slave Timing

This section specifies the SPI slave interface timing requirements. Please refer to [Section 8.4, "SPI Slave Operation,"](#) on page 118 for a functional description of this serial interface.

Figure 14.5 SPI Slave Timing

Table 14.9 SPI Slave Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
f_{sck}	SCK clock frequency			10	MHz
t_{high}	SCK high time	40			nS
t_{low}	SCK low time	40			nS
t_{nscss}	nSCS setup time	50			nS
t_{nscsh}	nSCS hold time	80			nS
t_{su}	Data input setup time	10			nS
t_{hd}	Data input hold time	20			nS
t_v	Data output valid time			40	nS
t_{ho}	Data output hold time	0			nS
t_{dis}	Data output disable time			40	nS

14.6 Clock Circuit

The LAN9313/LAN9313i can accept either a 25MHz crystal (preferred) or a 25MHz single-ended clock oscillator (+/- 50ppm) input. If the single-ended clock oscillator method is implemented, XO should be left unconnected and XI should be driven with a nominal 0-3.3V clock signal. The input clock duty cycle is 40% minimum, 50% typical and 60% maximum.

It is recommended that a crystal utilizing matching parallel load capacitors be used for the crystal input/output signals (XI/XO). See [Table 14.10](#) for crystal specifications.

Table 14.10 LAN9313/LAN9313i Crystal Specifications

PARAMETER	SYMBOL	MIN	NOM	MAX	UNITS	NOTES
Crystal Cut		AT, typ				
Crystal Oscillation Mode		Fundamental Mode				
Crystal Calibration Mode		Parallel Resonant Mode				
Frequency	F_{fund}	-	25.000	-	MHz	
Frequency Tolerance @ 25°C	F_{tol}	-	-	+/-50	PPM	Note 14.12
Frequency Stability Over Temp	F_{temp}	-	-	+/-50	PPM	Note 14.12
Frequency Deviation Over Time	F_{age}	-	+/-3 to 5	-	PPM	Note 14.13
Total Allowable PPM Budget		-	-	+/-50	PPM	Note 14.14
Shunt Capacitance	C_O	-	7 typ	-	pF	
Load Capacitance	C_L	-	20 typ	-	pF	
Drive Level	P_W	0.5	-	-	mW	
Equivalent Series Resistance	R_1	-	-	30	Ohm	
Operating Temperature Range		0	-	+70	°C	Note 14.16
n/a XI Pin Capacitance		-	3 typ	-	pF	Note 14.15
n/a XO Pin Capacitance		-	3 typ	-	pF	Note 14.15

Note 14.12 The maximum allowable values for Frequency Tolerance and Frequency Stability are application dependant. Since any particular application must meet the IEEE +/-50 PPM Total PPM Budget, the combination of these two values must be approximately +/-45 PPM (allowing for aging).

Note 14.13 Frequency Deviation Over Time is also referred to as Aging.

Note 14.14 The total deviation for the Transmitter Clock Frequency is specified by IEEE 802.3 as +/- 50 PPM.

Note 14.15 This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The XO/XI pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors. These two external load capacitors determine the accuracy of the 25.000 MHz frequency.

Note 14.16 +70°C for commercial version (LAN9313), +85°C for industrial version (LAN9313i)

Chapter 15 Package Outlines

15.1 128-VTQFP Package Outline

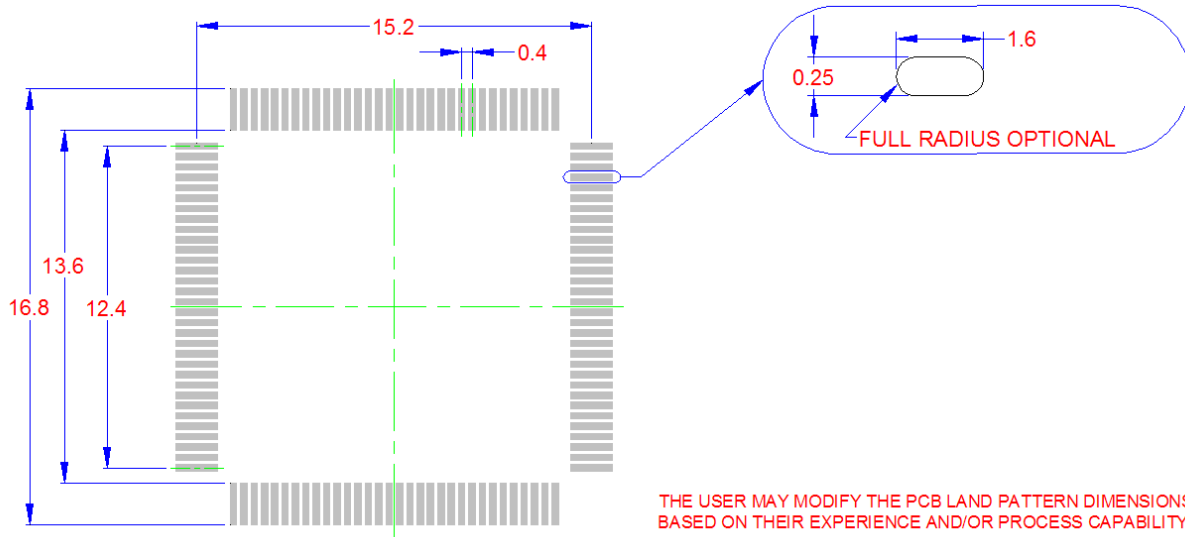

Figure 15.1 LAN9313 128-VTQFP Package Definition

Table 15.1 LAN9313 128-VTQFP Dimensions

	MIN	NOMINAL	MAX	REMARKS
A	-	-	1.20	Overall Package Height
A1	0.05	-	0.15	Standoff
A2	0.95	1.00	1.05	Body Thickness
