

## FEATURES

- 5 kV rms signal isolated CAN transceiver**
- 5 V or 3.3 V operation on  $V_{DD1}$**
- 5 V operation on  $V_{DD2}$**
- $V_{DD2SENSE}$  to detect loss of power on  $V_{DD2}$**
- Complies with ISO 11898 standard**
- High speed data rates of up to 1 Mbps**
- Short-circuit protection on CANH and CANL against shorts to power/ground in 24 V systems**
- Unpowered nodes do not disturb the bus**
- Connect 110 or more nodes on the bus**
- Thermal shutdown protection**
- High common-mode transient immunity: >25 kV/ $\mu$ s**
- Safety and regulatory approvals**
  - UL recognition (pending)
  - 5000 V rms for 1 minute per UL 1577
  - VDE Certificates of Conformity (pending)
  - DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12
  - $V_{IORM} = 846$  V peak
- Industrial operating temperature range:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$**
- Wide-body, 16-lead SOIC package**

## APPLICATIONS

- CAN data buses
- Industrial field networks

## GENERAL DESCRIPTION

The ADM3054 is a 5 kV rms signal isolated controller area network (CAN) physical layer transceiver. The ADM3054 complies with the ISO 11898 standard.

The device employs Analog Devices, Inc., *iCoupler*<sup>®</sup> technology to combine a 3-channel isolator and a CAN transceiver into a single package. The logic side of the device is powered with a single 3.3 V or 5 V supply on  $V_{DD1}$  and the bus side uses a single 5 V supply on  $V_{DD2}$  only. Loss of power on the bus side ( $V_{DD2}$ ) can be detected by an integrated  $V_{DD2SENSE}$  signal.

The ADM3054 creates an isolated interface between the CAN protocol controller and the physical layer bus. It is capable of running at data rates of up to 1 Mbps.

The device has integrated protection on the bus pins, CANH and CANL against shorts to power/ground in 24 V systems.

The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where the bus might be shorted to ground or power terminals. The part is fully specified over the industrial temperature range and is available in a 16-lead, wide-body SOIC package.

Lead Temperature	
Soldering (10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C
$\theta_{JA}$ Thermal Impedance	53°C/W
$T_J$ Junction Temperature	150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**ESD CAUTION**

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 7. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	NC	No Connect. This pin remains unconnected.
2	GND <sub>1</sub>	Ground (Logic Side).
3	GND <sub>1</sub>	Ground (Logic Side).
4	V <sub>DD2SENSE</sub>	V <sub>DD2</sub> Voltage Sense. A low level on V <sub>DD2SENSE</sub> indicates that power is connected on V <sub>DD2</sub> . A high level on V <sub>DD2SENSE</sub> indicates a loss of power on V <sub>DD2</sub> .
5	RxD	Receiver Output Data.
6	TxD	Driver Input Data.
7	V <sub>DD1</sub>	Power Supply (Logic Side); 3.3 V or 5 V. A decoupling capacitor to GND <sub>1</sub> is required; a capacitor value between 0.01 μF and 0.1 μF is recommended.
8	GND <sub>1</sub>	Ground (Logic Side).
9	GND <sub>2</sub>	Ground (Bus Side).
10	V <sub>REF</sub>	Reference Voltage Output.
11	CANL	Low Level CAN Voltage Input/Output.
12	CANH	High Level CAN Voltage Input/Output.
13	V <sub>DD2</sub>	Power Supply (Bus Side); 5 V. A decoupling capacitor to GND <sub>2</sub> is required; a capacitor value of 0.1 μF is recommended.
14	NC	No Connect. This pin remains unconnected.
15	NC	No Connect. This pin remains unconnected.
16	GND <sub>2</sub>	Ground (Bus Side).

## THEORY OF OPERATION

### CAN TRANSCEIVER OPERATION

A CAN bus has two states: dominant and recessive. A dominant state is present on the bus when the differential voltage between CANH and CANL is greater than 0.9 V. A recessive state is present on the bus when the differential voltage between CANH and CANL is less than 0.5 V. During a dominant bus state, the CANH pin is high and the CANL pin is low. During a recessive bus state, both the CANH and CANL pins are in the high impedance state.

The driver drives CANH high and CANL low (dominant state) when a logic low is present on TxD. If a logic high is present on TxD, the driver outputs are placed in a high impedance state (recessive state). The driver output states are presented in Table 9.

The receiver output is low when the bus is in the dominant state and high when the bus is in the recessive state. If the differential voltage between CANH and CANL is between 0.5 V and 0.9 V, the bus state is indeterminate and the receiver output can be either high or low. The receiver output states for given inputs are listed in Table 10.

### THERMAL SHUTDOWN

The ADM3054 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a junction temperature of 150°C is reached. As the device cools, the drivers reenables at a temperature of 140°C.

### TRUTH TABLES

The truth tables in this section use the abbreviations listed in Table 8.

**Table 8. Truth Table Abbreviations**

Letter	Description
H	High level
L	Low level
I	Indeterminate
X	Don't care
Z	High impedance (off)
NC	Disconnected

**Table 9. Transmitting**

Supply Status		Input	Outputs

On	On	Inputs open	Recessive	H	L
Off	On	X	X	I	I
On	Off	X	X	H	H

**ELECTRICAL ISOLATION**

In the ADM3054, electrical isolation is implemented on the logic side of the interface. Therefore, the device has two main sections: a digital isolation section and a transceiver section (see Figure 29). The driver input signal, which is applied to the TxD pin and referenced to the logic ground (GND<sub>1</sub>), is coupled across an isolation barrier to appear at the transceiver section referenced to the isolated ground (GND<sub>2</sub>). Similarly, the receiver input, which is referenced to the isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RxD pin referenced to the logic ground.

**iCoupler Technology**

The digital signals transmit across the isolation barrier using iCoupler technology. This technique uses chip scale transformer

windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are decoded into the binary value that was originally transmitted.

Positive and negative logic transitions at the input cause narrow (~1 ns) pulses to be sent to the decoder via the transformer. The decoder is bistable and is, therefore, set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than ~1 μs, a periodic set of refresh pulses, indicative of the correct input state, are sent to ensure dc correctness at the output. If the decoder receives no internal pulses for more than about 5 μs, the input side is assumed to be unpowered or nonfunctional, in which case the output is forced to a default state (see Table 9).

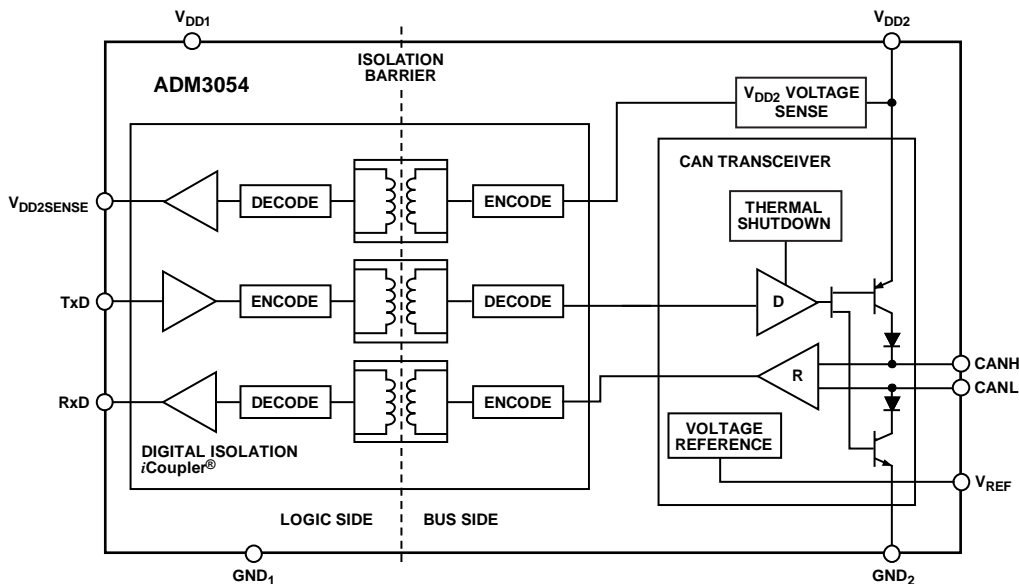

Figure 29. Digital Isolation and Transceiver Sections

**MAGNETIC FIELD IMMUNITY**

The limitation on the magnetic field immunity of the iCoupler is set by the condition in which an induced voltage in the receiving coil of the transformer is large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this may occur. The 3 V operating condition of the ADM3054 is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1 V. The decoder has a sensing threshold of about 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated.

The voltage induced across the receiving coil is given by

$$V = \left( \frac{-d\beta}{dt} \right) \sum \pi r_n^2 ; n = 1, 2, \dots, N$$

where:

$\beta$  is the magnetic flux density (gauss).

$N$  is the number of turns in the receiving coil.

$r_n$  is the radius of the  $n^{\text{th}}$  turn in the receiving coil (cm).

Figure 30. Maximum Allowable External Magnetic Flux Density

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field can be determined using Figure 30.

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is approximately 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and is the worst-case polarity, it reduces the received pulse from >1.0 V to 0.75 V, still well above the 0.5 V sensing threshold of the decoder.

Figure 31 shows the magnetic flux density values in terms of more familiar quantities, such as maximum allowable current flow at given distances away from the ADM3054 transformers.

Figure 31. Maximum Allowable Current for Various Current-to-ADM3054 Spacings

With combinations of strong magnetic field and high frequency, any loops formed by printed circuit board (PCB) traces can induce error voltages large enough to trigger the thresholds of succeeding circuitry. Therefore, care is necessary in the layout of such traces to avoid this possibility.
