## High-Side Power and Current Monitors

MAX4210/MAX4211

### General Description

The MAX4210/MAX4211 low-cost, low-power, high-side power/current monitors provide an analog output voltage proportional to the power consumed by a load by multiplying load current and source voltage. The MAX4210/MAX4211 measure load current by using a high-side current-sense amplifier, making them especially useful in battery-powered systems by not interfering with the ground path of the load.

The MAX4210 is a small, simple 6-pin power monitor intended for limited board space applications. The MAX4210A/B/C integrate an internal 25:1 resistor-divider network to reduce component count. The MAX4210D/E/F use an external resistor-divider network for greater design flexibility.

The MAX4211 is a full-featured current and power monitor. The device combines a high-side current-sense amplifier, 1.21V bandgap reference, and two comparators with open-drain outputs to make detector circuits for overpower, overcurrent, and/or overvoltage conditions. The open-drain outputs can be connected to potentials as high as 28V, suitable for driving high-side switches for circuit-breaker applications.

Both the MAX4210/MAX4211 feature three different current-sense amplifier gain options: 16.67V/V, 25.00V/V, and 40.96V/V. The MAX4210 is available in 3mm x 3mm, 6-pin TDFN and 8-pin  $\mu$ MAX<sup>®</sup> packages and the MAX4211 is available in 4mm x 4mm, 16-pin thin QFN and 16-pin TSSOP packages. Both parts are specified for the -40°C to +85°C extended operating temperature range.

### Applications

- Overpower Circuit Breakers
- Smart Battery Packs/Chargers
- Smart Peripheral Control
- Short-Circuit Protection
- Power-Supply Displays
- Measurement Instrumentation
- Baseband Analog Multipliers
- VGA Circuits
- Power-Level Detectors

$\mu$ MAX is a registered trademark of Maxim Integrated Products, Inc.

Pin Configurations and Selector Guide appear at end of data sheet.

### Features

- ◆ Real-Time Current and Power Monitoring
- ◆  $\pm 1.5\%$  (max) Current-Sense Accuracy
- ◆  $\pm 1.5\%$  (max) Power-Sense Accuracy
- ◆ Two Uncommitted Comparators (MAX4211)
- ◆ 1.21V Reference Output (MAX4211)
- ◆ Three Current/Power Gain Options
- ◆ 100mV/150mV Current-Sense Full-Scale Voltage
- ◆ +4V to +28V Input Source Voltage Range
- ◆ +2.7V to +5.5V Power-Supply Voltage Range
- ◆ Low Supply Current: 380 $\mu$ A (MAX4210)
- ◆ 220kHz Bandwidth
- ◆ Small 6-Pin TDFN and 8-Pin  $\mu$ MAX Packages (MAX4210)

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK
MAX4210AETT	-40°C to +85°C	6 TDFN-EP* (3mm x 3mm)	AHF
MAX4210AEUA	-40°C to +85°C	8 $\mu$ MAX	—

\*EP = Exposed paddle.

Ordering Information continued at end of data sheet.

# High-Side Power and Current Monitors

## ABSOLUTE MAXIMUM RATINGS

$V_{CC}$ , IN, CIN1, CIN2 to GND .....-0.3V to +6V  
 $RS+$ ,  $RS-$ , INHIBIT, LE, COUT1, COUT2 to GND .....-0.3V to +30V  
 IOUT, POUT, REF to GND .....-0.3V to ( $V_{CC} + 0.3V$ )  
 Differential Input Voltage ( $V_{RS+} - V_{RS-}$ ) ..... $\pm 5V$   
 Maximum Current into Any Pin ..... $\pm 10mA$   
 Output Short-Circuit Duration to  $V_{CC}$  or GND ..... 10s  
 Continuous Power Dissipation ( $T_A = +70^\circ C$ )  
 6-Pin TDFN (derate 24.4mW/ $^\circ C$  above +70 $^\circ C$ ) .....1951mW

8-Pin  $\mu$ MAX (derate 4.5mW/ $^\circ C$  above +70 $^\circ C$ ) .....362mW  
 16-Pin TSSOP (derate 9.4mW/ $^\circ C$  above +70 $^\circ C$ ) .....754mW  
 16-Pin Thin QFN (derate 25mW/ $^\circ C$  above +70 $^\circ C$ ) .....2000mW  
 Operating Temperature Range .....-40 $^\circ C$  to +85 $^\circ C$   
 Junction Temperature .....+150 $^\circ C$   
 Storage Temperature Range .....-65 $^\circ C$  to +150 $^\circ C$   
 Lead Temperature (soldering, 10s) .....+300 $^\circ C$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

( $V_{CC} = 5.0V$ ,  $V_{RS+} = 25V$ ,  $V_{SENSE} = 5mV$ ,  $V_{IN} = 1.0V$ ,  $V_{LE} = 0V$ ,  $R_{IOUT} = R_{POUT} = 1M\Omega$ ,  $V_{CIN1+} = V_{CIN2+} = V_{REF}$ ,  $V_{CIN1-} = V_{CIN2-} = GND$ ,  $V_{INHIBIT} = 0V$ ,  $R_{COUT1} = R_{COUT2} = 5k\Omega$  connected to  $V_{CC}$ ,  $T_A = -40^\circ C$  to +85 $^\circ C$ , unless otherwise noted. Typical values are at  $T_A = +25^\circ C$ , unless otherwise noted.) (Note 1)

## Functional Diagrams

# High-Side Power and Current Monitors

## Functional Diagrams (continued)

MAX4210/MAX4211

### Detailed Description

The MAX4210/MAX4211 families of current- and power-monitoring ICs integrate a precision current-sense amplifier and an analog multiplier for a variety of current and power measurements. The MAX4211 integrates an additional uncommitted 1.21V reference and two comparators with open-drain outputs. These features enable the design of detector circuits for over-power, overcurrent, overvoltage, or any combination of fault conditions. The MAX4210/MAX4211 offer various gains, packages, and configurations allowing for greater design flexibility and lower overall cost.

These devices monitor the load current with their high-side current-sense amplifiers and provide an analog

output voltage proportional to that current at IOUT (MAX4211). This voltage is fed to the analog multiplier for multiplying the load current with a source voltage to obtain a voltage proportional to load power at POUT.

### Current-Sense Amplifier

The integrated current-sense amplifier is a differential amplifier that amplifies the voltage across RS+ and RS-. A sense resistor, RSENSE, is connected across RS+ and RS-. A voltage drop across RSENSE is developed when a load current is passed through it. This voltage is amplified and is proportional to the load current. This voltage is also fed to the analog multiplier for power-sensing applications (see the *Analog Multiplier* section). The current-sense amplifiers feature three gain options: 16.67V/V, 25.0V/V, and 40.96V/V (see Table 1).

## High-Side Power and Current Monitors

The common-mode voltage range is +4V to +28V and independent of the supply voltage. With this feature, the device can monitor the output current of a high-voltage source while running at a lower system voltage typically between 2.7V and 5.5V.

The MAX4211 has a current-sense amplifier output. The voltage at IO<sub>UT</sub> is proportional to the voltage across V<sub>SENSE</sub>:

$$V_{IOUT} = A_{VIOUT} \times V_{SENSE}$$

where V<sub>SENSE</sub> is the voltage across RS<sup>+</sup> and RS<sup>-</sup>, and A<sub>VIOUT</sub> is the amplifier gain of the device given in Table 1.

### Analog Multiplier

The MAX4210/MAX4211 integrate an analog multiplier that enables real-time monitoring of power delivered to a load. The voltage proportional to the load current is fed to one input of the multiplier and a voltage proportional to the source voltage is fed to the other. The analog multiplier multiplies these two voltages to obtain an output voltage proportional to the load power. The analog multiplier is designed only to operate in the positive quadrant, that is, the inputs and outputs are always positive voltages.

For the MAX4210D/E/F and MAX4211D/E/F, the analog multiplier full-scale input at IN is approximately 1V. This independent multiplier input allows greater design flexibility when using an external voltage-divider. For the MAX4210A/B/C and MAX4211A/B/C, an integrated voltage-divider divides the source voltage at the RS<sup>+</sup> pin by a nominal value of 25 and passes this voltage to the multiplier. Thus, the full-scale input voltage at RS<sup>+</sup> is 25V. The integrated, trimmed resistor-dividers reduce external component count and cost.

The voltage output at PO<sub>UT</sub> is proportional to the output power:

For the MAX4210A/B/C and MAX4211A/B/C:

$$V_{POUT} = A_{VPOUT} \times V_{SENSE} \times V_{RS+}$$

For the MAX4210D/E/F and MAX4211D/E/F:

$$V_{POUT} = A_{VPOUT} \times V_{SENSE} \times V_{IN}$$

**Table 1. MAX4211 Current-Sense Amplifier Gain and Full-Scale Sense Voltage**

PART	CURRENT-SENSE AMPLIFIER GAIN (A <sub>VIOUT</sub> , V/V)	FULL-SCALE SENSE VOLTAGE (mV)
MAX4211A/D	16.67	150
MAX4211B/E	25.00	150
MAX4211C/F	40.96	100

where V<sub>SENSE</sub> is the voltage across RS<sup>+</sup> and RS<sup>-</sup> and A<sub>VPOUT</sub> is the amplifier gain of the device given in Table 2.

### Internal Comparators (MAX4211)

The MAX4211 features two uncommitted open-drain output comparators. These comparators can be configured to trip when load current or power reaches a set limit. They can also be configured as a window comparator with wire-OR output. Comparator 1 (CO<sub>UT</sub>1) features latch-enable (LE) and inhibit (INHIBIT) inputs. When LE is low, the comparator is transparent (it functions as a regular unlatched comparator). When LE is high, the comparator output (CO<sub>UT</sub>1) is latched. When high, the INHIBIT input suspends the comparator operation and latches the output to the current state. The operation of INHIBIT is similar to LE, except it has a different input threshold and wider hysteresis. The INHIBIT logic-high threshold is 1.21V and logic-low threshold is 0.6V with 0.6V hysteresis. INHIBIT is useful in preventing the comparator from giving false output during fast RS<sup>+</sup> transients. INHIBIT is generally triggered by an RC network connected to RS<sup>+</sup> (see the *Applications Information*). Both comparators have a built-in 300μs blanking period at power-up to prevent false outputs. The comparator outputs are open drain and they can be pulled up to V<sub>CC</sub>, RS<sup>+</sup>, or any voltage less than +28V. LE and INHIBIT are internally pulled down by a 1μA source.

**Table 2. MAX4210/MAX4211 Power-Sense Amplifier Gain and Full-Scale Sense Voltage**

PART	POWER-SENSE AMPLIFIER GAIN (A <sub>VPOUT</sub> , 1/V)	FULL-SCALE SENSE VOLTAGE (mV)

# High-Side Power and Current Monitors

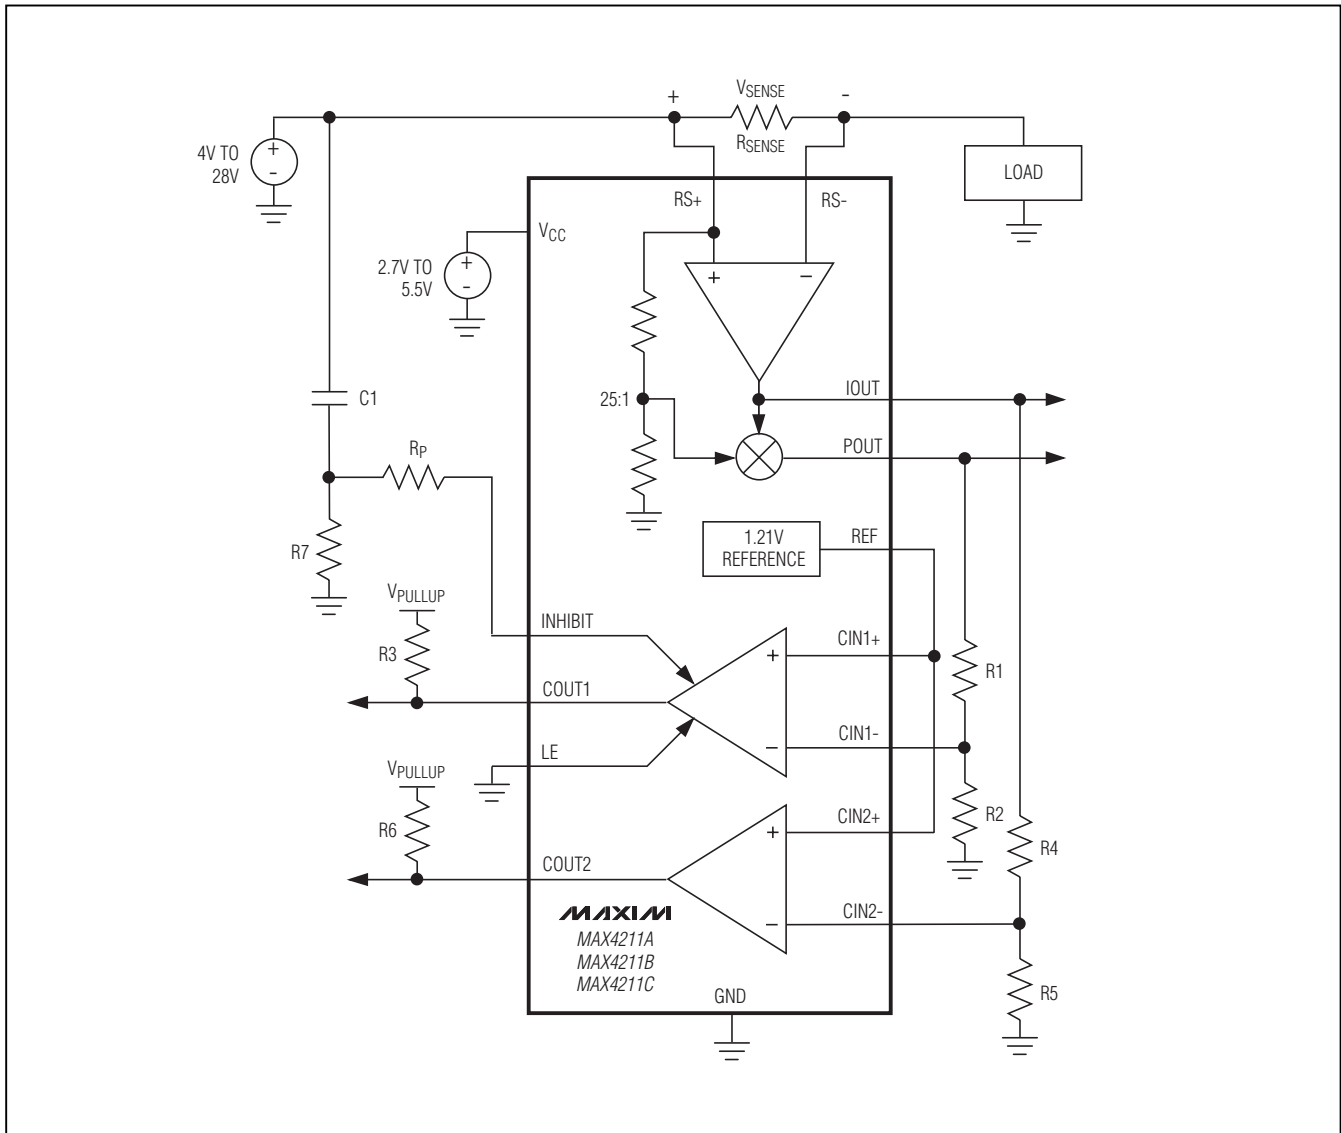

MAX4210/MAX4211

## Internal Reference (MAX4211)

The MAX4211 features a 1.21V bandgap reference output, stable over supply voltage and temperature. Typically, the reference output is connected to one of

the comparators' inputs. This is the comparison reference voltage. If a lower reference voltage is needed, use an external voltage-divider. The reference can source or sink a load current up to 100 $\mu$ A.

## Typical Operating Circuit

# High-Side Power and Current Monitors

## Applications Information

### Recommended Component Values

Ideally, the maximum load current develops the full-scale sense voltage across the current-sense resistor. Choose the gain version needed to yield the maximum current-sense amplifier output voltage without saturating it. The typical high-side saturation voltage is about  $V_{CC} - 0.25V$ . The current-sense amplifier output voltage is given by:

$$V_{IOUT} = V_{SENSE} \times A_{V_{IOUT}}$$

where  $V_{IOUT}$  is the voltage fed to the analog multiplier or at IOUT.  $V_{SENSE}$  is the sense voltage.  $A_{V_{IOUT}}$  is the current-sense amplifier gain of the device specified in Table 1. Calculate the maximum value for  $R_{SENSE}$  so the differential voltage across  $RS+$  and  $RS-$  does not exceed the full-scale sense voltage:

$$R_{SENSE} = \frac{V_{SENSE(FULL-SCALE)}}{I_{LOAD(FULL-SCALE)}}$$

Choose the highest value resistance possible to maximize  $V_{SENSE}$  and thus minimize total output error. In applications monitoring high current, ensure that  $R_{SENSE}$  is able to dissipate its own  $I^2R$  power dissipation. If the resistor's power dissipation is exceeded, its value can drift or it can fail altogether, causing a differential voltage across the terminals in excess of the absolute maximum ratings. Use resistors specified for current-sensing applications.

### Window Comparator

In some applications where undercurrent or underpower (open-circuit fault) and overcurrent or overpower (short-circuit fault) needs to be monitored, a window comparator is desirable. Figure 1 shows a simple circuit suitable for window detection. Let  $P_{OVER}$  be the minimum load power required to cause a low state at COUT2, and let  $P_{UNDER}$  be the maximum load current required to cause a high state at COUT1:

$$P_{UNDER(WATTS)} = \frac{V_{REF}}{A_{V_{POUT}} \times R_{SENSE}} \left( \frac{R_1 + R_2}{R_2} \right)$$

$$P_{OVER(WATTS)} = \frac{V_{REF}}{A_{V_{POUT}} \times R_{SENSE}} \left( \frac{R_4 + R_5}{R_5} \right)$$

where  $A_{V_{POUT}}$  is the power-sense amplifier gain given in Table 2, and  $V_{REF}$  is the internal reference voltage (1.2V, typ). The resulting comparator output is high

when the current is inside the current window and low when the current is outside the window. Note that COUT1 and COUT2 are wire-ORed together.

### Overpower Circuit Breaker

Figure 2 shows a circuit breaker that shuts off current to the load when an overpower fault is detected (the same circuit can be used to detect overcurrent conditions by connecting the R1-R2 resistor-divider to IOUT, instead of POUT). This circuit is useful for protecting the battery from short-circuit or overpower conditions. When a power fault is detected, the P-MOSFET, M1, is turned off and stays off until the manual reset button is pressed. Also, cycling the input power causes the LE pin to go low, which unlatches the comparator output OUT1 and resets the circuit breaker.

During power-up or when the characteristics of the load change, there can be an inrush current into the load. The temporary inrush current results in a higher voltage at POUT. This can bring the voltage at CIN+ above the reference voltage at CIN-, and, as a result, COUT1 goes high triggering the circuit-breaker function. This unwanted behavior can be disabled by bringing comparator 1's INHIBIT input high. An RC network connected to INHIBIT (R4 and C1) can be incorporated to suspend comparator 1's operation for a brief period. In this way, short surges in load power can be made invisible to the circuit-breaker function, while longer term overpower load demands (or a load short circuit) still "trip the breaker."

The logic-high threshold for INHIBIT is typically 1.2V, and the logic-low threshold is 0.6V. During power-up, INHIBIT quickly exceeds 1.2V through C1 and inhibits COUT1 from changing state. The comparator inputs are "inhibited" until the INHIBIT voltage is discharged to 0.6V. R3 is a current-limiting resistor, typically 10k $\Omega$ , which protects the INHIBIT input. Since INHIBIT is a high-impedance input, R3 has no effect on the R4-C4 charge/discharge time. The time during which the comparator is suspended is approximated by:

$$t_{INHIBIT} = R_4 \times C_1 \ln \left( \frac{\Delta V}{0.6V} \right)$$

where  $\Delta V$  is the voltage change at the load. For improved transient immunity,  $t_{INHIBIT}$  can be increased as required, with the understanding that the breaker function will be suspended for this period.

If any comparator is not used, its input must be biased to a known state. For example, connect CIN+ to  $V_{CC}$  and CIN- to GND.

# High-Side Power and Current Monitors

MAX4210/MAX4211

Figure 1. Window Comparator for Detecting Underpower and Overpower Faults (Also Detects Undercurrent and Overcurrent Faults by R1 and R4 to IOUT Instead of POUT)

## Variable-Gain Amplifier

Figure 3 shows single-ended input, variable-gain amplifiers (VGA). This VGA features more than 200kHz bandwidth and is useful in automatic gain-control circuits commonly found in baseband processors. The gain is controlled by applying 0 to 1V to IN ( $V_{GC}$ ) of the MAX4210D/E/F; 0V corresponds to minimum gain and 1V corresponds to maximum gain.

## Measure Load Power

The MAX4210A/B/C and MAX4211A/B/C have internal voltage-divider resistors connected to RS+ and the analog multiplier input. This configuration measures source power accurately and provides protection to the power source such as a battery. To measure the load

power accurately, choose the MAX4210D/E/F and MAX4211D/E/F with an external resistor-divider connected directly to the load as shown in Figure 4. This configuration improves the load-power measurement accuracy by excluding the additional power dissipated by RSENSE.

## Power-Supply Bypassing

Bypass  $V_{CC}$  to GND with a 0.1 $\mu$ F ceramic capacitor to isolate the IC from supply-voltage transients. To prevent high-frequency coupling, bypass RS+ or RS- with a 0.1 $\mu$ F capacitor. On the TDFN and thin QFN packages, there is an exposed paddle that does not carry any current, but should also be connected to the ground plane for rated power dissipation.
