

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

General Description

The MAX4530/MAX4531/MAX4532 are low-voltage, CMOS analog ICs configured as an 8-channel multiplexer (mux) (MAX4530), two 4-channel muxes (MAX4531), and three single-pole/double-throw switches (MAX4532). These devices are pin compatible with the industry-standard 74HC4351/74HC4352/74HC4353. All devices have two complementary switch-enable inputs and address latching.

The MAX4530/MAX4531/MAX4532 operate from a single supply of +2V to +12V, or from dual supplies of ±2V to ±6V. On-resistance (150Ω max) is matched between switches to 8Ω max. Each switch can handle rail-to-rail analog signals. Off-leakage current is only 1nA at T_A = +25°C and 50nA at T_A = +85°C.

All digital inputs have 0.8V and 2.4V logic thresholds, ensuring both TTL- and CMOS-logic compatibility when using ±5V or a single +5V supply.

Applications

- Battery-Operated Equipment
- Data Acquisition
- Test Equipment
- Avionics
- Networking
- ATE Equipment
- Audio-Signal Routing

Features

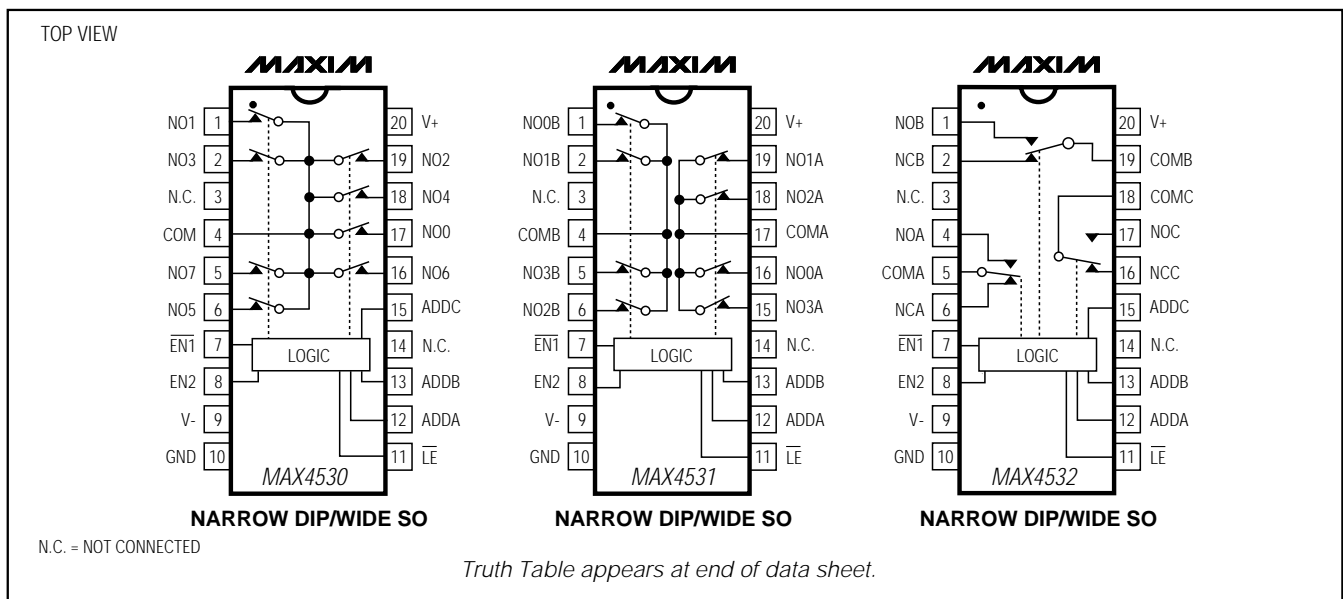

- ◆ Pin Compatible with 74HC4351/74HC4352/74HC4353
- ◆ ±2.0V to ±6V Dual Supplies
+2.0V to +12V Single Supply
- ◆ 75Ω Signal Paths with ±5V Supplies
150Ω Signal Paths with +5V Supply
- ◆ Rail-to-Rail Signal Handling
- ◆ t_{ON} and t_{OFF} = 150ns and 120ns at ±4.5V
- ◆ <1μW Power Consumption
- ◆ >2kV ESD Protection per Method 3015.7
- ◆ TTL/CMOS-Compatible Inputs
- ◆ Small, 20-Pin SSOP/SO/DIP Packages

Ordering Information

Pin Configurations

MAX4530/MAX4531/MAX4532

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

ABSOLUTE MAXIMUM RATINGS

Voltages Referenced to V-

V+-0.3 to +13V

Voltage into Any Terminal (Note 1)

or $\pm 20\text{mA}$ (whichever occurs first)-0.3 to (V+ + 0.3V)

Continuous Current into Any Terminal..... $\pm 20\text{mA}$

Peak Current, NO, NC, or COM_

(pulsed at 1ms, 10% duty cycle)..... $\pm 40\text{mA}$

ESD per Method 3015.7>2000V

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)

Plastic DIP (derate 11.11mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)889mW

SO (derate 10.00mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)800mW

SSOP (derate 8.00mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)640mW

Operating Temperature Ranges

MAX453_C_P 0°C to $+70^\circ\text{C}$

MAX453_E_P -40°C to $+85^\circ\text{C}$

Storage Temperature Range -65°C to $+150^\circ\text{C}$

Lead Temperature (soldering, 10sec) $+300^\circ\text{C}$

Note 1: Voltages exceeding V+ or V- on any signal terminal are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—Dual Supplies

(V+ = $+5\text{V} \pm 10\%$, V- = $-5\text{V} \pm 10\%$, GND = 0V, V_{ADD_H} = V_{EN_H} = V_{CE} = 2.4V, V_{ADD_L} = V_{EN_L} = 0.8V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted.)

Hold Time, Latch Enable to Channel Select	t_H	Note 3	$T_A = +25^\circ C$	0		ns
Pulse Width, Latch Enable	t_{MPW}	Note 3	$T_A = +25^\circ C$	120		ns

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: $\Delta R_{ON} = R_{ON(max)} - R_{ON(min)}$.

Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges, i.e., $V_{NO} = 3V$ to $0V$ and $0V$ to $-3V$.

Note 6: Leakage parameters are 100% tested at maximum rated hot operating temperature, and guaranteed by correlation at $T_A = +25^\circ C$.

Note 7: Worst-case isolation is on channel 4 because of its proximity to the COM pin. Off isolation = $20 \log V_{COM} / V_{NO}$, V_{COM} = output, V_{NO} = input to off switch.

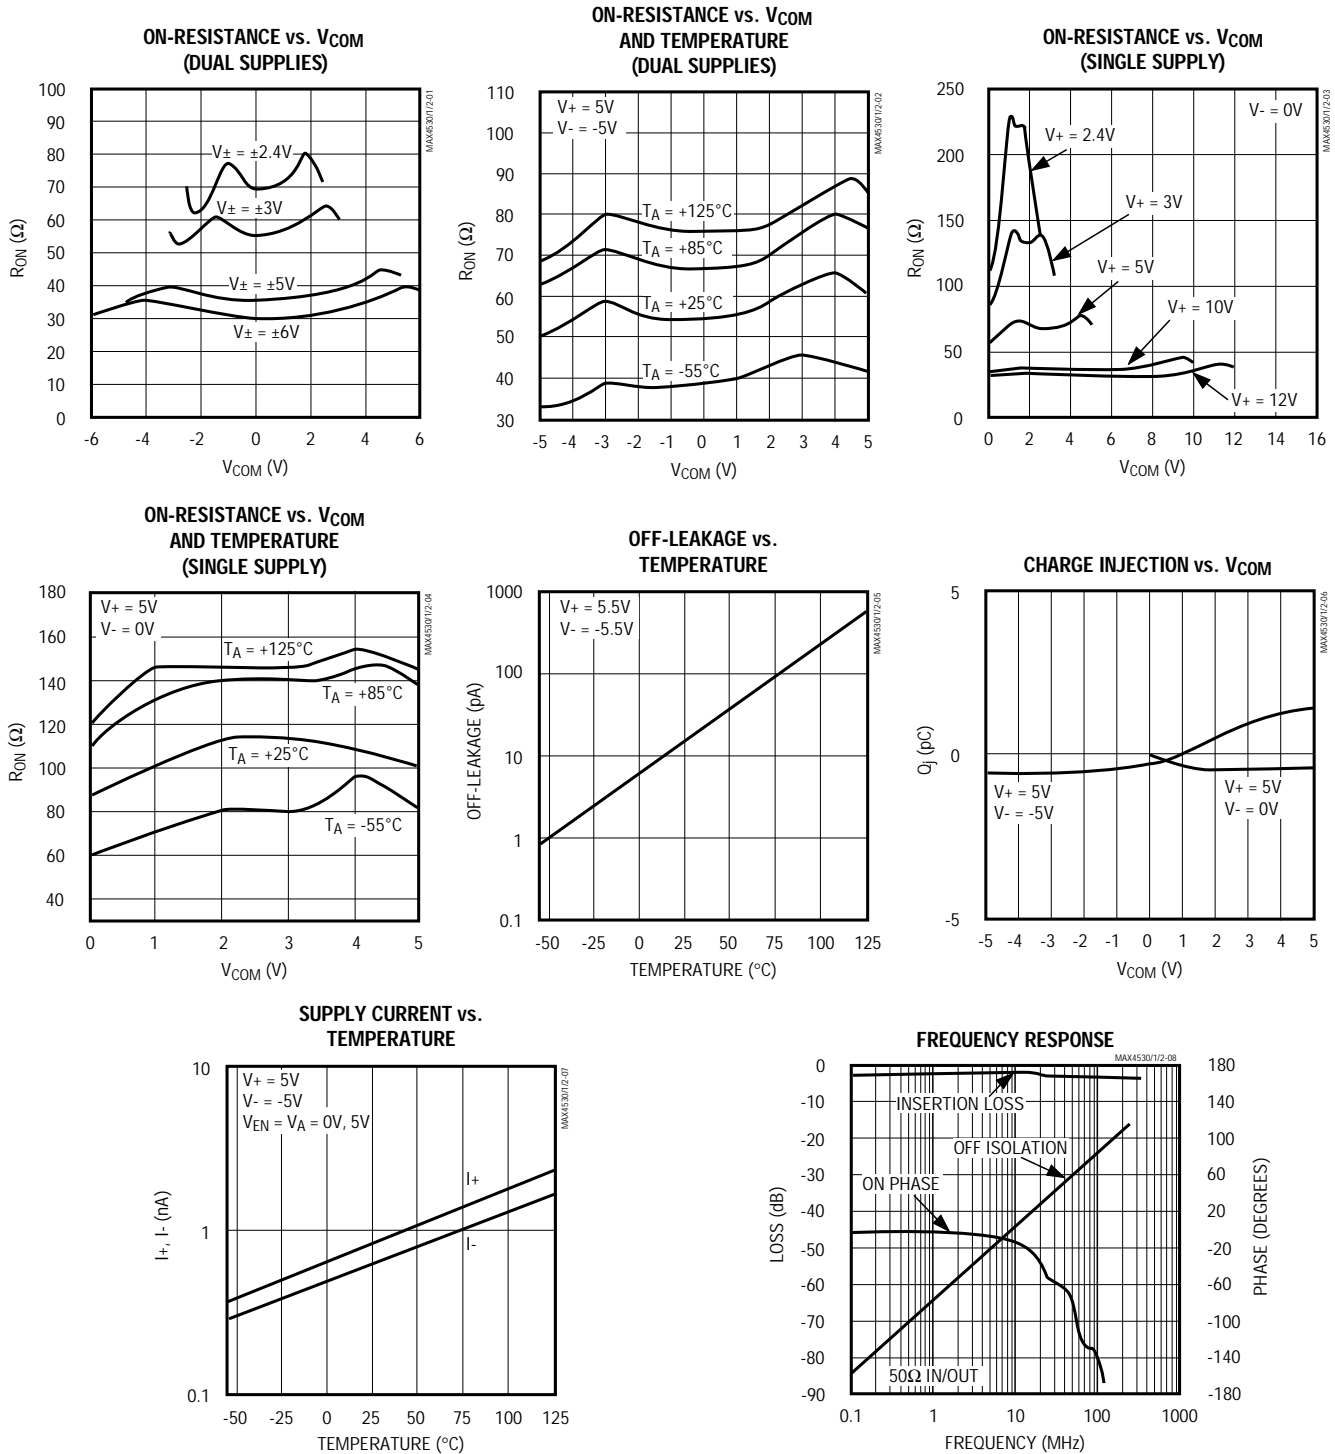

Note 8: Leakage testing at single supply is guaranteed by correlation testing with dual supplies.

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

Typical Operating Characteristics

($T_A = +25^\circ\text{C}$, unless otherwise noted.)

MAX4530/MAX4531/MAX4532

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

Pin Description

MAX4530/MAX4531/MAX4532

PIN			NAME	FUNCTION

—	—	1	NOB	Analog Switch “B” Normally Open Input
—	—	2	NCB	Analog Switch “B” Normally Closed Input
3, 14	3, 14	3, 14	N.C.	Not Internally Connected
4	—	—	COM	Analog Switch Common
—	4	19	COMB	Analog Switch “B” Common
—	—	4	NOA	Analog Switch “A” Normally Open Input
—	17	5	COMA	Analog Switch “A” Common
—	—	6	NCA	Analog Switch “A” Normally Closed Input
7	7	7	EN1	Enable Logic Input #1 (see <i>Truth Table</i>).
8	8	8	EN2	Enable Logic Input #2 (see <i>Truth Table</i>).
9	9	9	V-	Negative Analog Supply Voltage Input. Connect to GND for single supply operation.
10	10	10	GND	Negative Digital Supply Voltage Input. Connect to digital ground. (Analog signals have no ground)
11	11	11	LE	Address Latch Logic Input (see <i>Truth Table</i>).
12	12	12	ADDA	Address “A” Logic Input (see <i>Truth Table</i>).
13	13	13	ADDB	Address “B” Logic Input (see <i>Truth Table</i>).
15	—	15	ADDC	Address “C” Logic Input (see <i>Truth Table</i>).
—	16, 19, 18, 15	—	NO0A–NO3A	Analog Switch “A” Inputs 0–3
—	—	16	NCC	Analog Switch “C” Normally Closed Input
—	—	17	NOC	Analog Switch “C” Normally Open Input
—	—	18	COMC	Analog Switch “C” Common
20	20	20	V+	Positive Analog and Digital Supply-Voltage Input

NO_, NC_ and COM_ pins are identical and interchangeable. Either may be considered as an input or output; signals pass equally well in both directions.

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

Applications Information

Power-Supply Considerations

Overview

The MAX4530/MAX4531/MAX4532 construction is typical of most CMOS analog switches. They have three supply pins: V+, V-, and GND. V+ and V- drive the internal CMOS switches and set the limits of the analog voltage on any switch. Reverse ESD-protection diodes are internally connected between each analog-signal pin and both V+ and V-. One of these diodes conducts if any analog signal exceeds V+ or V-. During normal operation, these and other reverse-biased ESD diodes leak, forming the only current drawn from V+ or V-.

Virtually all of the analog leakage current comes from the ESD diodes. Although the ESD diodes on a given signal pin are identical and therefore fairly well balanced, they are reverse biased differently. Each is biased by either V+ or V- and the analog signal. This means their leakages vary as the signal varies. The difference in the two diode leakages to the V+ and V- pins constitutes the analog-signal-path leakage current. All analog leakage current flows between each pin and one of the supply terminals, not to the other switch terminal. For this reason, both sides of a given switch can show leakage currents of either the same or opposite polarity.

The analog-signal paths and GND are not connected.

V+ and GND power the internal logic and logic-level translators, and set both the input and output logic limits. The logic-level translators convert the logic levels into switched V+ and V- signals to drive the analog signals' gates. This drive signal is the only connection between the logic supplies and signals and the analog supplies. V+ and V- have ESD-protection diodes to GND.

The logic-level thresholds are TTL/CMOS compatible when V+ = +5V. As V+ rises, the threshold increases slightly, so when V+ reaches +12V, the threshold is about 3.1V—above the TTL guaranteed, high-level minimum of 2.8V, but still compatible with CMOS outputs.

Bipolar Supplies

The MAX4530/MAX4531/MAX4532 operate with bipolar supplies between $\pm 2.0\text{V}$ and $\pm 6\text{V}$. The V+ and V- supplies need not be symmetrical, but their sum cannot exceed the +13V absolute maximum rating.

Single Supply

The MAX4530/MAX4531/MAX4532 operate from a single supply between +2V and +12V when V- is connected to GND. All of the bipolar precautions must be observed. At room temperature, they actually work with a single supply at, near, or below +1.7V, although as supply voltage decreases, switch on-resistance and switching times become very high.

High-Frequency Performance

In 50 Ω systems, signal response is reasonably flat up to 50MHz (see *Typical Operating Characteristics*). Above 20MHz, the on response has several minor peaks that are highly layout dependent. The problem is not in turning the switch on, but in turning it off. The off-state switch acts like a capacitor and passes higher frequencies with less attenuation. At 10MHz, off isolation is about -65dB in 50 Ω systems, becoming worse (approximately 20dB per decade) as frequency increases. Higher circuit impedances also make off isolation worse. Adjacent channel attenuation is about 3dB above that of a bare IC socket, and is due entirely to capacitive coupling.

X = Don't Care *ADDC not present on MAX4531.

Note: NO_ and COM_ pins are identical and interchangeable. Either may be considered an input or an output; signals pass equally well in either direction. \overline{LE} is independent of \overline{ENT} and EN2.
