

Dual Channel Line Receiver Hermetically Sealed Optocoupler

Technical Data

HCPL-1930
HCPL-1931
HCPL-193K
5962-89572

Features

- Dual Marked with Device Part Number and DSCC Standard Microcircuit Drawing
- Manufactured and Tested on a MIL-PRF-38534 Certified Line
- QML-38534, Class H and Class K
- Hermetically Sealed 16-pin Dual In-Line Package
- Performance Guaranteed Over -55°C to +125°C
- High Speed – 10 Mb/s
- Accepts a Broad Range of Drive Conditions
- Adaptive Line Termination Included
- Internal Shield Provides Excellent Common Mode Rejection
- External Base Lead Allows "LED Peaking" and LED Current Adjustment
- 1500 Vdc Withstand Test Voltage
- High Radiation Immunity
- HCPL-2602 Function Compatibility
- Reliability Data Available

Applications

- Military and Space
- High Reliability Systems
- Isolated Line Receiver
- Simplex/Multiplex Data Transmission
- Computer-Peripheral Interface
- Microprocessor System Interface
- Harsh Environmental Environments
- Digital Isolation for A/D, D/A Conversion
- Current Sensing
- Instrument Input/Output Isolation
- Ground Loop Elimination
- Pulse Transformer Replacement

Description

The HCPL-193X devices are dual channel, hermetically sealed, high CMR, line receiver optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either a standard product or with full MIL-PRF-38534 Class Level H or K testing, or from the DSCC Standard Microcircuit Drawing (SMD) 5962-89572. This is a sixteen pin DIP which may be purchased with a variety of lead bend and plating options. See selection guide table for details. Standard Microcircuit Drawing (SMD) parts are available for each lead style.

Functional Diagram

The connection of a 0.1 μ F bypass capacitor between pins 15 and 10 is recommended.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

All devices are manufactured and tested on a MIL-PRF-38534 certified line and are included in the DSCC Qualified Manufacturers List QML-38534 for Hybrid Microcircuits.

Each unit contains two independent channels, consisting of a GaAsP light emitting diode, an input current regulator, and an integrated high gain photon detector. The input regulator serves as a line termination for line receiver applications. It

clamps the line voltage and regulates the LED current so line reflections do not interfere with circuit performance. The regulator allows a typical LED current of 12.5 mA before it starts to shunt excess current. The output of the detector IC is an open collector Schottky clamped transistor. An enable input gates the detector. The internal detector shield provides a guaranteed common mode transient immunity specification of +1000 V/ μ sec.

DC specifications are compatible with TTL logic and are guaranteed from -55°C to +125°C allowing trouble-free interfacing with digital logic circuits. An input current of 10 mA will sink a six gate fan-out (TTL) at the output with a typical propagation delay from input to output of only 45 nsec.

Notes:

- Bypassing of the power supply line is required, with a $0.1\ \mu\text{F}$ ceramic disc capacitor adjacent to each isolator. The power supply bus for the isolators should be separate from the bus for any active loads, otherwise additional bypass capacitance may be needed to suppress regenerative feedback via the power supply.
- Derate linearly at $1.2\text{ mA}/^\circ\text{C}$ above $T_A = 100^\circ\text{C}$.
- Each channel.
- Device considered a two terminal device: pins 1 through 8 are shorted together, and pins 9 through 16 are shorted together.
- The t_{PLH} propagation delay is measured from the 6.5 mA point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The t_{PHL} propagation delay is measured from the 6.5 mA point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse.
- The t_{ELH} enable propagation delay is measured from the 1.5 V point on the trailing edge of the enable input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The t_{EHL} enable propagation delay is measured from the 1.5 V point on the leading edge of the enable input pulse to the 1.5 V point on the leading edge of the output pulse.
- CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state, i.e. $V_{OUT} > 2.0\text{ V}$.
- CM_L is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state, i.e. $V_{OUT} < 0.8\text{ V}$.
- Measured between adjacent input leads shorted together, i.e. between 1, 2 and 4 shorted together and pins 5, 6 and 8 shorted together.
- No external pull up is required for a high logic state on the enable input.
- Measured between pins 1 and 2 or 5 and 6 shorted together, and pins 10 through 15 shorted together.
- Parameters shall be tested as part of device initial characterization and after process changes. Parameters shall be guaranteed to the limits specified for all lots not specifically tested.
- Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). Hi-Rel and SMD parts receive 100% testing at 25 , 125 , and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).

MIL-PRF-38534 Class H, Class K, and DSCC SMD Test Program

Agilent Technologies' Hi-Rel Optocouplers are in compliance with MIL-PRF-38534 Class H and K. Class H and Class K devices are also in compliance with DSCC drawing 5962-89572.

Testing consists of 100% screening and quality conformance inspection to MIL-PRF-38534.
